THE

INTERNATIONAL CYCLOPÆDIA.

BRAZIL, the largest state of South America and about equal in size to the United States, exclusive of Alaska, occupies the northeastern angle of the continent, extending from lat. $4^{\circ} 30' \text{ n.}$ to lat. 33° s. , and from long. 35° to long. 73 w. Its length is estimated at 2660 miles and its extreme breadth at 2705 miles. Towards the interior it borders on all the other states of South America except Chile and Ecuador. Its coast line is nearly 4000 miles in extent, and its total area, according to official accounts, 3,288,110 square miles.

History.—In 1500, January 26, Vicente Yañez Pinçon, a companion of Columbus, landed at Cape Augustine, near Pernambuco, and from thence sailed northward along the coast, as far as the Orinoco. In the same year, another Portuguese commander, Pedro Alvarez Cabral, driven by adverse winds to the Brazilian coast, landed at Porto Seguro, and taking possession in the name of his monarch, named the country *Terra da Vera Cruz*. In 1501 and 1503 expeditions were sent thither under Amerigo Vespucci, who on the second voyage reached Brazil and built a fort, remaining there about five months, and then returned with a cargo of Brazil-wood, which gave the vast region its name. The Spaniards of Buenos Ayres founded Montevideo to control the Plata, but in 1509 Portugal, then at war with France, wrested from the latter more territory on the Amazon than she was to lose on the Plata. In 1531 the first permanent settlement was made by the Portuguese, on the island of S. Vincente, lat. $24^{\circ} 30' \text{ s.}$ The hostility of the natives and the lack of means led to the abandonment of many settlements subsequently made, and a Huguenot colony, established on the bay of Rio de Janeiro in 1555, was broken up by the Portuguese in 1567, who then founded Rio, the present capital. In 1578 Brazil, as a dependency of Portugal, became a Spanish possession, but in 1630 the Dutch captured Pernambuco and held it, with other places, for twenty years. In 1654 Portugal regained Brazil, and in 1679 founded Colonia, opposite Buenos Ayres, in order to hold the eastern shore of the La Plata. This gave rise to a dispute with Spain, lasting until 1827, when the independence of Banda Oriental, as the territory was called, was recognized by Brazil. The discovery of gold toward the end of the 17th century, and of diamonds, in 1710, resulted in the rise of a number of mining towns, and in the removal of the capital from Bahia to Rio de Janeiro, but the arbitrary and exclusive colonial system under which Brazil had been settled, together with the lack of order, education, and internal communication, kept the country in a backward state. In 1807, under the pressure of French invasion, the royal family of Portugal fled to Brazil, which remained the virtual seat of government until 1821, when Dom João VI. returned, leaving his eldest son, Dom Pedro, as Prince Regent. During this period, the ports of Brazil were opened to commerce, foreign artisans were welcomed, various restrictions on domestic industries were removed, and schools, public institutions, and new courts were established, but the popular desire for free government increased; the Prince Regent, himself ambitious, willingly encouraged the movement, and directing the revolution that ensued, proclaimed the independence of Brazil, September 7, 1822, and on October 12 was crowned Emperor, as Dom Pedro I. Early in 1825 the constitution was ratified and sworn to, and in 1835 it received some amendments. The arbitrary measures of Dom Pedro made him unpopular, and in 1831 he abdicated in favor of the heir apparent, then a child, and returned to Portugal. Under the regencies which followed Brazil was vexed by disorders and political intrigues, and the reaction against republicanism ended in 1840 in the declaration of the young Prince's majority, and in his coronation in 1841, at the age of fifteen, as Dom Pedro II. (q.v.). The only wars which occurred during his reign—omitting a few insignificant revolutionary outbreaks—were in 1852 and 1865–70, the first having for its object the overthrow of the Rosas dictatorship in Buenos Ayres, and the second being the contest waged against Paraguay by Brazil, aided by Uruguay and the Argentine Republic. The centralizing system of the empire and the maladministration of the provinces gradually excited a widespread feeling of discontent, especially in the army, and the attempt in 1889 to form a *Garde Nationale* to be entirely under imperial control, hastened the crisis. On November 15

intelligence that Rio was in the hands of insurgents reached the Emperor at his country seat, and on hastening to the capitol he found that the ministry had been deposed. Later in the day a provisional government, headed by General da Fonseca (q.v.), was organized, which issued a manifesto proclaiming a republic. All these changes met with little opposition; indeed, it had been long and widely believed that the empire would not outlive the Emperor. Dom Pedro attempted to form a new ministry, but was prevented, and a new decree ordered him to leave the country with his family within twenty-four hours. The same decree continued the imperial dowry and granted the Emperor a subsidy of \$2,500,000, both of which he refused. On the following day, November 16, the Emperor and his family embarked for Portugal, and the proclamation, November 21, of universal suffrage to all Brazilians who could read and write, was followed by the appointment of a commission to draft a federal constitution. September 15, 1890, was fixed as the date for electing delegates to the constitutional assembly, and November 15 as the date for the first session of said assembly. On January 10, 1890, the separation of church and state was decreed by the provisional government. The new constitution (subject to further revision) was promulgated, June 23. In 1891, Gen. da Fonseca was elected the first president of the republic, but resigned in the same year, and was succeeded by Gen. Peixoto. In 1894, a revolt, probably aiming to restore the Empire, was headed by Admirals Da Gama and Mello and supported by the navy. Rio Janeiro was blockaded and shelled by the rebels; but largely owing to the non-recognition of the United States, whose war-vessels broke the blockade (May, 1894), the revolt collapsed, and the insurgents fled or surrendered.

Topography.—Extending as it does over about 30° of latitude, Brazil comprises every variety of surface, and although much of it is still unexplored, the country as a whole is known to be less mountainous than was formerly supposed, and to consist in great part of elevated plateaus from 1000 to 3000 feet in height, crossed here and there by ridges and intersected by broad valleys. The principal mountain chains, the Serra da Mantiqueira and Serra do Espinhaço, contain the sources of the São Francisco and Paraná rivers and the first-named range has one peak, called Pico do Itatiaiossi, over 8000 feet high. A nearly parallel range on the west forms the mountains of Goyaz, the highest portion of which, the Montes Pyreneos, has peaks 9000 feet high. A series of high plateaus, the Serra das Vertentes (range of the water-shed) extends westward from the Goyaz mountains nearly or quite to the Madeira river, dividing the tributaries of the Amazon from those of the Paraguay and Paraná. Of the eastern ranges, the most important is the Serra do Mar, extending from the province of Rio de Janeiro nearly to the 30th parallel, and there dividing into two branches, one of which passes westward into the Argentine Republic. The highest portion of the Serra do Mar is that known as the Organ mountains, north of the bay of Rio, whose singular peaks rise to a height of 7500 feet. The valley of the Amazon is described as a lowland plain, and the banks of that river as nowhere more than 250 feet above sea level. The greater part of the coast is sandy and low.

The Amazon (see article on that river), with its tributaries, drains fully one-half of the country, varies in width from half a mile to a mile where it enters Brazil, and is about 150 miles wide at its mouth. Its largest branch, east of the Madeira, is the Tocantins, formed by the junction of the Almas and Maranhão, which, flowing north for 900 miles, unites with the Araguaya to form the Pará branch of the Amazon. The Araguaya divides in its course into two branches, which, after flowing 220 miles reunite, forming in this manner an island called the Ilha Bananal. The Araguaya is navigable, but the other rivers east of the Madeira descend rapidly from their table-lands and few can be navigated by vessels for long distances. The streams west of the Madeira have a sluggish current and can be freely navigated for long distances. Of the northern tributaries of the Amazon the longest (1000 miles) is the Rio Negro. This is connected with the Orinoco by a natural canal called the Casiquiare. The eastern coast rivers are mostly small, but the São Francisco, a powerful stream, is 1800 miles in length, and is freely navigable by vessels for 150 miles from the Atlantic, where passage is obstructed by the Paulo Affonso falls. Its tributaries are unimportant, but one of them rises in the same lake with a branch of the Tocantins, thus making northeastern Brazil practically an island. The three branches of the La Plata system,—the Paraguay, Paraná, and Uruguay, drain, it is estimated, nearly one-fifth of the country.

The rock formation of the coast, from the province of Maranhão southward and the southeastern and southern mountains are of gneiss, which appears also along the rivers flowing northward to the Amazon and even north of the Amazon itself. Metamorphosed clay slates occur in Minas-Geraes and Matto-Grosso. The carboniferous strata are chiefly found along the coast south of Rio. Cretaceous rocks have been traced from the coast at about 18° s. northwestward as far as the Purus river, and are believed to underlie the tertiary deposits of the Amazon valley. In the province of Sergipe the cretaceous rocks are underlaid by triassic red sandstone. Tertiary clays and ferruginous sandstones overlie the cretaceous rocks of the coast plains unconformably. Drift, ascribed to the agency of glacier ice, covers the Amazon valley and southeastern and southern Brazil. True coral reefs are found along the northeastern coast. Hot wells and springs of saline or alkaline character abound.

Mineralogy.—Brazil is very rich in minerals and precious stones. There are coal basins of large extent; there are copper mines in the province of Rio Grande do Sul and

in Pará and Ceará; lead, iron, silver, manganese, mercury, sulphur, and saltpeter abound. Salt is extensively produced in saline marshes by the alternate processes of inundation and evaporation. Gold, accompanied with silver, is found in many of the provinces, but is especially abundant in Minas-Geraes, where the principal mines belong to English companies. Diamonds are obtained in Minas-Geraes, São Paulo, Matto Grosso, and Bahia, and the ruby, emerald, sapphire, topaz, tourmaline, amethyst, opal, and other stones are more or less common. There are valuable phosphate deposits on some of the islands, and petroleum is obtained in one or two of the provinces.

Fauna and Flora.—The most formidable and common beast of prey is the onça or jaguar. Besides, there are found the puma or cougar, ocelot, tiger-cat, red wolf, Brazilian dog or wild fox, wild hog, tapir, capybara or water hog, paca, three species of deer, numerous sloths, ant-eaters, armadillos, opossums, coatis, water-rats, otters, and porcupines. Rabbits, hares, and squirrels abound, and there are many species of monkeys and several kinds of bats, including the vampire. Large herds of wild horses and of half-wild oxen are seen on the southern plains. One derives some idea of the immense number of birds from Wallace's statement that he found 500 species in the Amazon valley alone, and reckoned thirty distinct species of parrots and twenty varieties of humming-birds. The largest birds are the ouira, a large eagle, the rhea or American ostrich, and the gariama (q.v.). Toucans, snowy herons, ducks, frigate birds, wild peacocks, turkeys, geese, and pigeons, are met with along the coasts or in the forests. The uraponga or bell-bird (q.v.) oriole and whippoorwill are among the smaller birds. The most venomous of the many serpents are the jararaca and the rattlesnake. The jiboia or boa-constrictor and anaconda attain great length, and at least three species of cobra are noted as dangerous. Alligators, turtles, and lizards are numerous, and along the Amazon is seen the singular juruá or cowfish, an herbivorous cetacean. The rivers, lakes, and coast-waters literally swarm with fish. In the Amazon and its tributaries Agassiz found nearly 2000 species. The pira rucú, one of the largest taken in the Amazon, is a staple article of food. The piranha, a voracious fish, inhabits the São Francisco; the garoupa, a sea-fish, is of excellent flavor; the vermelho and curvina are not unlike the red-snapper of more northern waters; the dourado, a river fish, resembles the shad, and the mero, badejo, roballo, and others are highly esteemed for food. The insects include beautiful butterflies, large beetles, scorpions and spiders, bees of many kinds, musical crickets, destructive ants, the cochineal insect, sandflies and mosquitoes, and the pium, a minute fly whose bite is poisonous and sometimes dangerous.

Vegetation is of the most luxuriant description, and the forests of the Amazon valley are believed to be the most extensive in the world, producing fully 400 species of trees. The botanical families most numerous represented are the *Compositæ*, *Leguminosæ*, *Rubiaceæ*, *Aroidææ*, and *Filices*. In marshy places and along streams, reeds, grasses, and water plants grow in tangled masses, and in the forests trees crowd each other in the struggle for life, and are draped with parasitic vines or bound together by a network of lianas (q.v.). Along the coast mangroves, mangoes, cocoas, dwarf palms, and the Brazil-wood (q.v.) are noticeable. The southern province of Santa Catharina produces more than 40 different kinds of trees valuable for timber. Malloes and mimosas abound along the São Francisco, and among the innumerable trees of the Amazon and its affluents are the itauba or stonewood, so named from its durability, the cassia, the cinnamon-tree, the lime, the banana, the myrtle, the guava, the *bertholletia*, which yields "Brazil nuts" (q.v.), the jacaranda or rosewood (q.v.), the pao d'arco or bow-wood, the Brazilian bread-fruit, whose large seeds are used for food, the euphorbia, the copaiba, the myrtle, the macaranduba, with a bark rich in tannin and yielding a milky sap resembling india rubber, when coagulated, the large and lofty cotton-tree, the tall, white-trunked seringa or rubber-tree, which furnishes the gum of commerce, and the numerous palms (300–400 species), chief among them the carnauba palm, every part of which is useful, from the wax of its leaves to its edible pith, and the piassaba palm, the bark of which is clothed with a loose fiber used for coarse textile fabrics and for brooms. Orchidaceous plants, including several species of vanilla and showy epiden-drums, rehxiæ, bignonias, etc., adorn the forests, while the southern campos or prairies are covered with coarse grasses and scattered clumps of small trees or cacti. The eucalyptus and other Australian trees and shrubs have been successfully introduced. There are several kinds of nutritious native grasses which furnish grazing throughout the year. Among indigenous fruits are the pine-apple, fig, custard-apple, mango, banana, guava, and grape (*v. sycoides*), and orange. European grapes, olives, and watermelons of fine flavor are cultivated.

Climate.—This is as varied as the surface of the vast country, but is in general healthful. The Amazon valley and the coast from about lat. 20° northwards are subject to great heat, and have a winter season lasting from the end of November until the middle of May, and characterized by violent rains with thunder and lightning. At Pará, on the coast, the thermometer ranges from 98° F. to 68°. Along the Amazon showers frequently occur during the "dry season." In the inland, central provinces rainy periods occur from late October to March or April. The southeastern coast, between parallels 15° and 25°, and the valley of the São Francisco are subject to rains between October and May. In the province of São Paulo the principal rains fall between November and April. Farther south the seasons are less abruptly divided. The mean

annual temperature at the falls of the Madeira is estimated at 77°, while in the vicinity of Rio de Janeiro the thermometer ranges from 75° in January to 65° in July. The extremes are still lower in Paraná and Rio Grande do Sul. The northern coast is visited by easterly trade-winds during much of the year, the central coast by northeasterly or southeasterly winds, and the interior by southerly or northerly winds. In the mountains and on the uplands of the central and southern provinces frosts not infrequently occur in the "winter months" of June and July, and snow often falls during this period even in Paraná and Rio Grande do Sul. Brazil is exempt from the disasters produced by volcanoes and earthquakes, to which the Pacific coast is subject. Intermittent fevers prevail in the mountain valleys and marshy districts, and there are occasional epidemics of cholera and yellow fever, due largely to lack of sanitary precautions.

Agriculture.—Only a small portion of the surface of Brazil is under cultivation. This is in great measure due to the unfertile character of the country as a whole, large tracts being wholly unproductive or subject to long-continued droughts. Again, the agricultural population is small, as a rule, and the farms and plantations are tilled in a very slow and primitive manner, and in many parts the gathering of forest products is preferred. The profitable crops, coffee and sugar, naturally have the largest areas devoted to them; tobacco and cotton coming next. The coffee-plant is most extensively grown in the provinces of Rio de Janeiro, Minas-Geraes, and São Paulo, but can be grown in nearly every part of Brazil. The annual yield is estimated at 8,000,000 bags. Nearly all the coffee used in the United States comes from Brazil. The Atlantic provinces yield the sugar supply, especially Bahia and Pernambuco. Cotton of excellent quality is produced in every province, but Pernambuco and Maranhão are said to be best fitted for it. The average yield is two and one-half bales per acre. Tobacco, raised chiefly in Bahia, São Paulo, Pará, and Minas-Geraes, is inferior to that of the West Indies. The greater part of the tobacco exported is grown in Bahia. Maize is one of the leading products of Minas-Geraes and São Paulo, but not enough is raised for home consumption, and the same is true of rice. The small grains do not flourish. Among the more common food products are sweet potatoes, yams, beans, and the farina prepared from the root of the manioc (q. v.) or cassava. Cocoa is grown in northeastern Brazil, and the holly or ilex, which yields the maté (q. v.) or Paraguay tea, is cultivated to some extent in the extreme southern provinces, where it is indigenous. Pumpkins, squashes, cabbages, okra, tomatoes, onions, cucumbers, and other vegetables are raised.

Industries.—Manufactures, long occupying a subordinate place as compared with agriculture, mining, and the collecting of forest products, are becoming more important. In the provinces of Bahia and Pernambuco and elsewhere the refining of sugar is extensively carried on by the diffusion process, or in remote districts by somewhat primitive methods. Several kinds of rum are distilled in the sugar districts, and cigar-making is an important industry. In 1896 there were over one hundred and fifty cotton factories in B. The smelting of metals, the manufacture of steam-engines and agricultural tools, the tanning of leather and working of hides, and the manufacture of salt, straw hats, soap and candles employs many hands, and within recent years the list of artificial products has been lengthened by the addition of paper, calicoes, powder and dynamite, glass, wines, beer, cotton-seed oil, castor-oil, wax matches, and sulphuric acid. The raising of cattle and the breeding of horses give occupation to many in the southern province of Rio Grande do Sul. Although Brazil has so many kinds of durable woods, timber for making railroad cars is imported from India, and large quantities of salt fish are brought from the United States when Brazil might easily supply her needs by improving her own fisheries. The scarcity of coal and labor, and the unfavorable character of the mining laws operate against the production of precious metals. Ship-building is carried on at several ports.

Commerce.—Coffee furnishes about two-thirds of the total exports, from six to seven million bags being shipped annually, followed in importance by sugar and rubber. The principal exports to the United States, besides the articles just mentioned, are cocoa, horse-hair, wool, and hides. Other exports are cotton, tobacco, nuts, maté or Paraguay tea, dye and cabinet woods, gold-dust, diamonds, drugs and medicinal plants, tallow, horns, etc. From the United States are imported flour, cotton goods, iron and steel manufactures, petroleum, lard, soap, lumber, wooden ware, boots and shoes, etc. From Europe are obtained wines and iron, and from England the chief supply of cotton goods. Statistics for 1894 and 1895 show an extensive and increasing trade with Germany, which takes (1897) the larger part of the Brazilian tobacco crop, and buys a large quantity of coffee. The chief centers of foreign trade, and, together with São Paulo, in the interior, the principal cities, are Pará or Belem, Maranhão, Bahia, Pernambuco, and Rio de Janeiro, or Rio, the capital and the favorite halting-place of the outward-bound vessels for India, China, and Australia. In 1867 the Amazon was opened to all nations. Twenty-three steamship lines are subsidized by the government, including two from Santos to Hamburg and Genoa. Of six lines between Brazil and the United States four are British and one is German. The exports in 1895 were £36,000,000, and the imports £30,000,000. The exports to the United States in 1896 amounted to \$71,060,046: the imports from that country to \$14,258,187. Export duties are levied on domestic products. The merchant navy of B. in 1895 consisted of 189 steamers and 285 sailing vessels. By a treaty signed 1891, the United States agreed to admit Brazilian sugar, molasses, coffee and hides free of duty, and Brazil, in return, to admit free of duty a large number of agricultural products, all grains and manufactures of them, hay, pork (except hams), coal,

UNIVERSITY OF CALIFORNIA

a large range of machinery and tools, and materials for railroad construction and equipment, besides reducing 25 per cent. the duties on many other articles. The light-houses along the coast number 59, that at the entrance to the bay of Rio being the finest.

Steam communication with Europe was opened in 1850, and telegraphic communication in 1874. The first railway was opened in 1854. In the construction of most of the railways the government has guaranteed the interest on the capital. In 1896 there were 8086 miles of railway open to traffic, and 5403 in process of construction. In 1895 there were 10,143 miles of telegraphs, with 289 offices, from which 1,283,695 messages were sent. The telegraph system of the country is under the control of the government. Brazil is connected with Europe by cable, and Pará and New York are similarly united. In 1893 there were 2826 post-offices, handling during the year 33,441,000 letters and postal cards, 37,674,000 samples and printed packets.

Almost all the circulation of Brazil is paper money. In 1892 the two chief banks of issue were consolidated as the Bank of the Republic of Brazil, and made responsible for the circulation, but the ultimate liability rests on the government. There is a mint at Rio and a domestic marine and fire insurance company. Weights and measures are those of the French metric system. The standard of value is the gold octava of 22 carats, equal to four milreis, a milreis having the value of \$1.08.

Religion, Education, and Literature.—Until 1890, when the separation of church and state was decreed, the Roman Catholic was the established religion, but all others were tolerated and no one could be persecuted for religious acts. The Archbishop of Bahia, the primate of the Roman Catholic church, has under him 11 suffragan bishops, 12 vicars-general, and 2000 curates. Presbyterian and other Protestant missionaries have met with some success, and Protestant colonies from Europe have established themselves, but the number of those unconnected with the ancient church is still comparatively small. Education is in a backward state, and fully 80 per cent. of the population is illiterate. The federal government controls two establishments for secondary education, united under the name of the *Gymnasio Nacional*, but the state governments are allowed to found and maintain similar institutions. Primary instruction in the states is under state or municipal control. Higher education is exclusively controlled by the central government. In 1886 the number of schools was 6224, and in 1893 they were estimated at 8000. Primary education is gratuitous, and, by the terms of the constitution, education must at every stage be under lay direction. The state college at Rio has connected with it schools of mining and engineering, an observatory, and a faculty of medicine, also (at Bahia) a faculty of medicine, and at São Paulo and Pernambuco faculties of law. At Rio, also, are institutions for the blind and the deaf and dumb, a conservatory of music, a school of agriculture, an academy of fine arts, a commercial institute, a school for technical education, and a national museum of natural history. Near the city is a military college with a school of gunnery. Academies at Rio and Rio Grande do Sul provide military training supplementing that given in the preparatory and regimental schools. There is a naval school with attached school of practical artillery and a naval college. Manáos has a botanical museum, and Pará, Ceará, and Ouro Preto, museums. A seminary for religious instruction is established in each province. The University of Coimbra, Portugal, frequently enrolls students from Brazil. The larger cities have scientific and literary associations, the oldest of which is the Historical, Geographical, and Ethnological Institute of Brazil at Rio, founded in 1838. Nearly all important places have libraries, Rio alone having no less than twenty.

The influence of the mother country upon Brazilian literature was so strong that in the strict sense there were no native authors until the present century. In the 16th century Bento Teixeira Pinto, of Pernambuco, attained distinction as a writer of poetry and prose; the 17th century produced the satirist Gregorio de Mattos, of Bahia, the poets Euzebio de Mattos, brother of Gregorio, and Manoel Botelho de Oliveira, the dramatist Borges de Barros, and the historians Rocha and Jabotao Pitta and Diogo Gomes Carneiro. The 18th century, more prolific, gave birth to, among others, Antonio José da Silva (1705-39) of Rio, a distinguished dramatist, who removed to Portugal where he was burnt by the Inquisition, to José Mariano da Conceição Velloso, author of the botanical work, *Flora Fluminense*, and the poets Frei José de S. Rita Durão (1719-84), author of the epic poem "Caramurú," Thomaz Gonzaga (1744-1809), and Antonio Bereira de Sonza Caldas (1762-1814). Among the writers of the present century are the poets Domingos José Gonçalves de Magalhães, Viscount of Araguaia (1811-82), called the founder of the national theatre, Antonio Gonçalves Dias (1823-64), who wrote also a dictionary of the Tupi language, Aranko Porto-Alegre, Baron of Santo-Angelo (1806-79), and Casimiro José, Marquis of Abreu (1837-60), while fiction is well represented by Joaquín Manoel de Macedo (1820-82) a dramatist as well, José Martiniano de Alencar (1829-77), author of about 30 works of fiction, and Bernardo Guimarães, poet as well as novelist. There should be added the poets Alberto de Oliveira, Raymundo Corrêa, Valentim Magalhães, and Luiz Guimarães, Jr. Among historians of Brazil may be named José Maria da Silva Paranhos, Baron of Rio-Branco, and Varnhagen, Viscount of Porto-Seguro. The writers of the country have paid especial attention to fiction and poetry, and, latterly, to journalism. In pulpit oratory, and in the composition

of sacred poetry Francisco José de Carvalho (Frei Francisco de Monte-Alverne, 1785-1858) was conspicuous. The language of Brazil is Portuguese, more or less modified by dialect.

Government.—By the constitution of 1824 the executive power was vested in the emperor and a cabinet of 7 ministers; the legislative, in a general assembly of two houses, and the judicial in a council of state of 24 members (advisory only), a supreme tribunal, 12 district courts, and the usual subordinate courts. The crown was hereditary and irrevocable, and was vested with the rights of veto and pardon. The senate was composed of 60 life-members representing provinces, each chosen by the crown from a list of 3 members elected by the people; the chamber of deputies was composed of members representing districts and elected directly by popular vote. The right of suffrage was so restricted that the voting population barely numbered 150,000.

The constitution adopted in Feb., 1891, bases the federal system upon that of the United States. The first presidential election was by Congress, but subsequent elections have been by means of electors selected in each state by the people in proportion to their delegations in Congress. Should no citizen obtain an absolute majority of the Electoral College, then Congress shall choose one of the three persons receiving the largest number of votes. Should this measure fail, then Congress shall vote again, dropping the third name and voting for the two who have the largest number of votes, so that the president-elect shall have an absolute majority. The president is elected for four years, and shall be ineligible for the next ten years succeeding his term of office. He alone is responsible to the nation. The imperial ministers are replaced by secretaries of state, who are responsible to the president, and who are ineligible for the presidency during their terms of office. The Congress consists of a house of representatives and a senate, whose powers are purely legislative. An adverse vote by either chamber does not entail a change of ministry. A new house of representatives is elected triennially and a new senate every 9 years (one-third renewed every three years). There are 63 senators (3 for each state and federal district) and 212 deputies, according to population. The president of the senate is the vice-president of the republic. In case of the absence or death of the president, his office shall be filled by the vice-president, next by the speaker of the house of representatives, next by the vice-president of the senate, and lastly by the president of the supreme tribunal of justice. Citizens shall be unrestricted in speech, occupation, residence, religion, right to assemble in public or private, or to enter and leave the country at pleasure, and shall be equal before the law. All titles, distinctions, privileges, and decorations are abolished. New laws forbid marriage between persons of the same blood, make marriage before a civil officer obligatory, and permit divorce, but not remarriage.

The army, in 1895, comprised 4000 officers and 24,120 men, but the force could be increased in time of war. There was, in addition, a gendarmerie of 20,000 men. The navy consisted of 7 port-defence armor-clads, 1 second class battleship, 14 cruisers (1 of the first class, the others of the second and third classes), a torpedo flotilla comprising 8 first class, 6 third class torpedo boats, and small vedette boats. In accordance with a new naval programme there were several war vessels in process of construction. There are five naval arsenals.

The public debt, Dec. 31, 1895, was 1,888,475,666 milreis, of which 678,073,022 consisted of paper money issues. The foreign debt amounted to 320,918,332 milreis. The revenue for 1896, largely derived from customs duties, was 331,174,400 milreis; the expenditures, 343,436,210.

Population.—Agassiz describes the amalgamation of races, especially in the maritime provinces, as more widespread than in any other country in the world, the best qualities of the several races being effaced, "leaving a mongrel type deficient in physical and mental energy." About two-thirds of the population consists of mamalucos of mixed Indian and Portuguese stock, cafuzos (Indian and negro), mulattoes, and unmixed Indians and Africans. The savage Indians of the interior are generally of medium height, and are copper-colored, muscular, small-featured, and more active mentally than the Indians of North America. The Botocudos (q.v.) of the Rio Doce are among the most barbarous of the tribes, and have a different language from that used by the other Indians. Polygamy is practised by some tribes and cannibalism by the dwellers of the Purus valley. A remnant or division of the Carib nation is found in the province of Matto Grosso. The slave trade, begun early in the 18th century, was prohibited in 1831, but the importation was not prohibited till 1853, and did not cease until 1854. In 1871 a law was passed enacting that after that date all children born of slave mothers should be free, but should serve the mother's master until twenty-one years of age. The same law set apart an emancipation fund to be applied to the ransom of slaves owned by private persons. After that time emancipation made rapid progress and down to 1883 87,700 persons had been freed. In 1887 the number of slaves was 700,000, but in 1888 slavery was abolished by imperial edict.

The Brazilians as a nation are described as grave and ceremonious, but polite, quick-witted, hospitable, fond of music, and possessed of considerable sense of humor. A tendency to vindictiveness, unhappily, occasions frequent homicides among the ignorant and degraded. Love of country appears to be an active virtue. Family and social life in the cities resembles that of Europe or the United States, but in smaller places it is primitive, and women of the better classes lead a secluded and indolent existence. Aristocracy is based upon descent from the noble families of Portugal, ample fortune,

or length of time in the service of the country. The inhabitants of the southern provinces are more energetic than their fellow-countrymen in the north, doubtless owing to the more stimulating climate. Lotteries are very popular, large sums being annually invested. They are taxed by the government, and form a productive source of revenue. The budget for 1897 estimated the returns from this tax at 1,500,000 milreis. For types of aborigines, see *illus.*, *PATAGONIA*, Vol. XI., and for coat of arms of empire see *HERALDRY*, Vol. VII.

The Republic of Brazil has 20 provinces and 1 Federal District. Previous to 1872, when the first full census was taken, the estimates were based upon the official returns of 1817 and 1818. In 1850 the population was supposed to be about 7,000,000, and in 1860, 8,000,000. In the following table the figures for 1872 include about 250,000 wild Indians. Figures marked * are based upon provincial estimates. Figures for 1890 are from the census returns of Dec. 31, 1890.

PROVINCES.	Sq. Miles.	1872.	1890.	CHIEF TOWNS.
Amazonas.....	753,469	56,610*	207,610	Manáos.
Pará.....	412,467	259,821	889,821	Pará.
Maranhão.....	141,651	359,040	469,050	S. Luiz do Maranhão.
Piauíhy.....	81,779	202,222	202,222	Therézina.
Ceará.....	50,262	721,686*	881,686	Fortaleza.
Rio Grande do Norte.....	20,130	233,979	313,979	Natal.
Parahyba.....	20,346	362,557	382,587	Parahyba.
Pernambuco.....	46,257	841,539*	1,101,539	Pernambuco.
Alagoas.....	11,642	348,009*	648,009	Maceio.
Sergipe.....	12,038	161,307	461,307	Aracajú.

Goyaz.....	263,373	100,395*	260,395	Goyaz.
Matto Grosso.....	668,655	60,417*	170,417	Cuyabá.
Total.....	3,288,110	9,700,187	16,360,226	

The largest city, Rio, had, in 1892, a population of 522,651. Bahia had 200,000; Pernambuco, 190,000; Belem, 65,000; Ceara, 35,000; Maranhão, 38,000; São Paulo, 100,000; Porto Alegre, 55,000; Parahyba, 40,000, and Ouro Preto, 22,000.

See *Brazil and the Brazilians*, by Kidder and Fletcher (1857); *Wallace's Travels on the Amazon and Rio Negro* (1853); *Bates' The Naturalist on the River Amazon* (1863); *Keller's The Amazon and Madeira* (1874); *Agassiz's Journey in Brazil* (1868); *Scully's Brazil* (1868); *Hart's Scientific Results of a Journey in Brazil*, by Professor Louis Agassiz (1870); *Burton's Explorations of the Highlands of Brazil* (1869); *Dent's A Year in Brazil* (1886); *Andrews' Brazil* (New York, 1887); *Climat, géologie, faune, et géographie botanique du Brésil*, by Liais (1872); *Macedo's Notions on the Chorography of Brazil* (trans., 1873); *The Empire of Brazil at the Vienna Exhibition* (Rio de Janeiro, 1873); *Gorringe's The Coast of Brazil and Trade of its Ports* (Washington, 1873); *de Almeida's Atlas do Imperio do Brazil* (Rio de Janeiro, 1868); *Le Brésil en 1889*, published by the Brazilian committee at the Paris Exposition; *O dialecto Brasileiro*, by Vasconcellos (Oporto, 1883); also the *Monthly Bulletin* and other publications of the Bureau of American Republics.

BRAZIL', a city and co. seat of Clay co., Ind., on the Chicago and Eastern Illinois, the Chicago and Southeastern, the Evansville and Indianapolis, and the Vandalia railroads, 57 miles w.s.w. of Indianapolis. There are many block coal mines near the place. The city has manufactures of mining engines, and machinery, railroad spikes, tile, sewer-pipe, pumps, fire-brick, and other articles; and churches, national bank, high school, public library, electric lights, and daily and weekly newspapers. Pop. 1870, 2186; 1890, 5905.

BRAZIL', ISLAND OF, one of the mythical islands of the Atlantic set down by early cosmographers. It was assigned to several places, and the tradition was not exploded until the publication of the British admiralty charts of 1865. See MYTHICAL ISLANDS.

BRAZIL CABBAGE, or CHOU CARAÍBE (*caladium sagittifolium*, or *xanthosoma sagittifolia*), a plant of the natural order *araceæ*, nearly allied to *cocco* (q.v.), and very similar to it, although it differs in having arrow-shaped pointed leaves. It is supposed to be originally a native of tropical America, but is now in common cultivation throughout the whole tropics; not only the root being used for food like that of *cocco*, but also the leaves boiled as greens. Both root and leaves are almost entirely destitute of the acidity so generally characteristic of the order.

BRAZILIAN GRASS, an incorrect name applied to a substance used in the manufacture of a cheap kind of hats, known as Brazilian grass hats, and also as *chip* hats.

It consists of stripes of the leaves of a palm, *chamærops argentea*, which are imported into Britain for this manufacture, and chiefly from Cuba. See CHAMÆROPS.

BRAZILIAN PLUM. See HOG PLUM.

BRAZIL NUTS are the seeds of the *bertholletia excelsa*, a majestic and beautiful tree of the natural order *lecythidaceæ* (q.v.). The tree grows to the height of 100 or 120 ft., and abounds on the banks of the Orinoco and in the northern parts of Brazil. It produces a round woody pericarp or seed-vessel, almost as large as a man's head, within which are many of the seeds or nuts. The pericarp is very heavy and solid, requiring a blow of a sledge-hammer to break it; and at the time when this great fruit is ready to fall, it is dangerous to walk under the tree. The seeds, which are popularly called nuts, and much resemble fruits of that description, are wrinkled and triangular, having a hard shell and a pure white kernel, which, when fresh, is very agreeable. They are chiefly exported from Para and French Guiana, and are well known in our shops. They yield a large quantity of oil, which is good for burning. The nuts or seeds of the *lecythia ollaris*, or POR TREE, are produced in a pericarp which resembles a rusty iron pot with a lid, the lid dropping off and letting the seeds out, which are oblong, grooved, and esteemed of a very superior quality to the common B. N.; but they have not yet become an article of commerce, as the tree grows chiefly in the interior parts of the country. See *illus.*, TREES, vol. XIV.

BRAZIL WOOD, a dark-red or yellowish-brown dye-wood, which forms a considerable article of export from Brazil, where some of the trees which yield it are very abundant. It is the produce of different species of *caesalpinia* (q.v.). The best kinds are those called Pernambuco wood, all saints' wood, and St. Martha wood. Much of the B. W. of commerce is obtained from *caesalpinia Brasiliensis*, a tree which is a native of the West Indies, commonly growing in dry places and among rocks, and seldom exceeding 30 ft. in height. It has bipinnate leaves, with many smooth, obtuse, oblong leaflets, and no terminal leaflets, the flowers in pannicles, with downy stalks. The heart-wood alone is of any value.—PERNAMBUCO WOOD is the produce of *caesalpinia echinata*, a prickly tree, with prickly pods, and of which the red and yellow flowers have a delicious smell, resembling that of the lily of the valley. The sap-wood is extremely thick, and the valuable heart-wood bears a small proportion to the whole diameter of the stem.—The sappan wood (q.v.) of the East Indies nearly approaches B.W. in quality. It is the produce of *caesalpinia sappan*, a small thorny tree.—The BRAZILETTO WOOD, sometimes also called B. W., which is brought from the Antilles, is much inferior. *Caesalpinia crista* probably yields some of the inferior West Indian Brazil wood.—It is a curious circumstance, that B. W. is said not to take its name from Brazil, but to be mentioned under the name *Braxilis* in documents much older than the discovery of America, the sappan wood of the East Indies being probably intended, and the name of Brazil has even been supposed to be derived from that of this product of its soil.

When freshly cut, the color of B. W. is yellow; but when exposed to air, moisture, and light, it becomes red, and is generally sent into market ground down to the size of ordinary sawdust. When treated with water, alcohol, or ether, the weathered B. W. readily yields up its red coloring matter, called *Brazêlén*. The latter is supposed to be produced from the oxidation of a colorless substance called *Brazilin*, which exists in the original yellow wood of the tree. Strong decoctions of B. W. are used by the dyer and calico-printer in the fabrication of reds, browns, etc.; it is also used in the manufacture of red ink. See INK.

BRAZING, or BRASS SOLDERING, is the process of uniting together two pieces of brass, two pieces of copper, or one of each, by means of a hard solder, partaking more or less of the composition and properties of ordinary brass. The edges or parts of metal to be joined are first filed bright, so as to be thoroughly clean, then there is strewed over the gap or crevice a mixture of the solder and borax. The solder employed varies in composition according to the kind of work, and may be rendered more fusible by the addition of a larger amount of zinc, but the general proportions are (1) 16 copper, 16 zinc, and 1 tin; (2) 12 brass, 4 zinc, and 3 tin; or (3) 18 brass, 3 zinc, and 2 tin. When the whole has been fused together, it is allowed to cool, and is then filed down to a coarse powder, in which state it is used. The borax is employed to form a glaze over the brightened surfaces, and thus prevent the oxidation of the metal, which would seriously interfere with B., and even stop the operation. An outward coating or layer of charcoal is likewise serviceable in the exclusion of the air during the B. of large pieces of metal. Where a very high heat is required in the process, a little powdered glass is mixed with the borax. The mixture of solder and borax may be applied dry, but it is better to moisten it with water, and to lay it on the filed surfaces with a spoon. The whole is then gently heated, when the water evaporates and leaves a crust of borax and solder. The work may now be strongly heated before the blow-pipe, or over a clear fire, and at a bright red heat the solder fuses, and the zinc begins to burn with a pale-blue flame. At this stage, the solder *flushes* or becomes liquid enough to permeate the joint or crevice; but should it be tardy in acting thus, several slight taps will insure the proper result. The whole is now cooled, and, towards the close, the articles may be introduced into cold water for more rapid reduction in temperature. Pieces of metal which have undergone the process of

B. are so firmly united that they may be rolled and re-rolled without the parts yielding. See SOLDER.

BRAZORIA, a co. in s.e. Texas on the Gulf of Mexico; 1440 sq. m.; pop. '90, 11,506, including colored. The International and Great Northern, the Gulf, Colorado, and Santa Fé, and the Velasco Terminal railroads intersect the county. It has a level surface of oak forests and prairie. Agriculture is the main occupation. Co. seat, Brazoria.

BRAZOS, a co. in s.e. Texas, on the B. river; 510 sq. m.; pop. '90, 16,650, incl. colored. The surface is undulating and fertile; chief business, agriculture. The Houston and Texas and the Gulf, Colorado, and Santa Fé railroads traverse the county. Co. seat, Bryan.

BRAZOS DE DI'OS, a river in the State of Texas, the second, if not the first, in magnitude that flows within the state. It runs towards the s.e., rising in the table-land of Lynn co., and falling into the gulf of Mexico about 40 m. to the s.w. of Galveston. With a course of about 900 m., it is navigable at all times to a distance of 40 m. from its mouth, and at certain seasons to a distance of 300 miles. The valley of the river, the lower half being merely an alluvial plain, presents extensive forests, interspersed with plantations of maize, sugar, and cotton.

BRAZOS DE SANTIA'GO, a port of entry in Cameron co., Texas, on the gulf of Mexico, 35 m. e.n.e. of Brownsville. It has some foreign and considerable coasting trade; imports in 1896, \$173,571, exports, \$297,031.

BRAZZA, an island in the Adriatic, belonging to Dalmatia, Austria, in lat. 43° to 44° n., and long. 16° to 17° east. It has an area of about 170 sq. m., and a pop. in 1890 of 22,650, and is separated from the mainland by a channel of some 7 or 8 m. in breadth.

BRAZZA, PIERRE SAVORGNAN, Count de, explorer; b. in Rome, Italy, in 1842; naturalized in France in 1879. He made his first expedition to Africa in 1875; established a commercial station on the Congo in 1879; became governor of the French Congo in 1883; and explored the principal rivers of that region, especially the Ogowe.

BREACH, in siege-works, is a gap in any of the defensive walls or gates of a city; and *breaching* is the operation by which the gap is produced by the guns of the besiegers. *Breaching batteries* are employed, consisting of several pieces of ordnance, so chosen as to kind and size, and so placed as to distance, as to burst a hole through the defenses in the shortest practicable time. The greatest effect is produced by lodging the balls in two vertical lines, from the parapet of the wall downwards, and in a horizontal line, connecting the lower ends of those vertical lines; and then overturning the mass of material thus loosened by an irresistible salvo or volley. When a hole has once been made, by thus knocking away the masonry or earthwork, the breaching is continued until the crumbling mass has so accumulated as to form a practicable slope, up which the storming-party of the besiegers may run. See ASSAULT. During the Peninsular war there were some formidable examples of breaching. At Badajoz, 14,000 shot brought down 180 ft. of wall in 104 hours, from a distance of 450 yards. At Ciudad Rodrigo, 6700 balls brought down 105 ft. of wall in 32 hours, from a distance of 560 yards. At St. Sebastian, 13,000 shot brought down 100 ft. of wall in 62 days, from a distance of 620 yards. It was calculated, from these and other instances, that 10,000 24-lb. shot, or 240,000 lbs. of iron, will breach 100 ft. of wall from a distance of 500 yards. At the siege of Fort Pulaski during the civil war (1862), it was estimated that in breaching the brick wall of the fort in two days, 110,600 pounds of metal from 36 guns struck it, giving an average of 2500 pounds to the square foot, from an average distance of 1687 yards.

BREACH (by derivation simply another form of the word *break*), in law, denotes any infringement or violation of a legal duty or obligation previously entered upon. The term is used more particularly with several specific phrases, which we shall consider briefly one by one: *Breach of Contract* is a phrase of very wide application; it denotes the non-fulfilment, either by commission or omission, of any agreement to do or not to do that for which a contract has been entered into by the offending party. Breaches of contract, therefore, are as varied as are conceivable contracts. Any injury not amounting to fraud for which damages may be demanded and recovered, if not *torts* (personal injuries), may be included under this head. As one writer says, "Any contract is broken by the failure of either party to do or to refrain from doing the thing which he agreed to do or not to do in the manner, time, and place in which it was agreed to be done or not done." The violation of agreements relating to the transfer or ownership of real property, or in regard to the exercise of rights connected therewith, does not, however, in legal phraseology, come under the description of breach of contract. Where one of the parties to a contract wilfully deceives the other, the wrong is *fraud*, and is distinct from mere breach of contract. Generally speaking, where no question of fraud or violation of trust is involved, a breach of contract is not criminal; if, however, there be a conspiracy among several persons to commit a breach of contract, the element of criminality will sometimes enter. The remedy for one who

has been injured by a breach of contract may consist either in the awarding of damages or the compelling of the offending party to specifically perform the act required; where there is a separate equity jurisdiction, as is the case in England and in some of our states, a demand for the specific performance of a contract must be made in the court of equity. For further consideration of this general subject see the articles on CHANCERY, COURT OF; CONTRACT; DAMAGES; EQUITY; GARNISH; OBLIGATION; SPECIFIC PERFORMANCE; and STOPPAGE IN TRANSITU. *Breach of Covenant* is defined in law phraseology as the violation of a specific covenant forming part of a deed of conveyance whereby the contracting party agrees to do or to abstain from doing some specific act connected with the conveyance.

Breach of Close is that form of trespass by which unlawful entry is made on land, and for which an action for damages will lie. This form of trespass was formerly called trespass *quare clausum fregit* (trespass whereby an enclosure is broken), the law supposing the existence about a man's land of an enclosure (*clausum*, or close); in other words, any entry of an illegal kind upon another's land was held as great an offense as if it were literally a breaking into a walled enclosure. Such a trespass, however slight, might be made the subject for an action of damages, and without regard to the amount of actual damage inflicted or, indeed, without regard to whether any actual damage had been done. It would be a good defense against such an action to set up and prove that it was done with the consent of the owner or in the pursuance of a legal right of any kind, such as appertains to a right of way, a right of common, or the exercise of a legal process. It makes no difference whether the trespass was actually done by the offender in person or by his agent, or even by his cattle. A Breach of Close, it has even been held, may be committed by one tenant in common against his co-tenants, or by a landlord against his own tenant. See TRESPASS.

Breach of Duty may be legally defined as either the non-execution of an office, or the performance of it in such a way that the conditions on which it is undertaken are violated. Such misconduct may either violate the conditions of an express contract, or it may be equally opposed and do equal violence to any implied engagement or assumption, as it is technically called in the law of England, not from the express determination of any court or the positive directions of any statute, but from natural reason and the just construction of law, which assumes and intends that every man has engaged what his duty or justice requires at his hands. And he must do this with integrity, diligence, and skill; for if, by his neglect, injury accrues to individuals, they have their remedy against him in damages. See CONTRACT, DUTY, OBLIGATION, DAMAGES, EQUITY, PERFORMANCE OF CONTRACTS.

Breach of Privilege is an action in violation of the privilege of a legislative body, as Parliament, the Houses of Congress or a state legislature; such a breach would be the arrest for debt of a member of Parliament, the contempt of a legislative committee by refusing to appear before it, or resistance to an officer of a legislature—a sergeant-at-arms, for instance—in the performance of his duty.

Breach of Promise has become almost universally restricted to the violation of a promise to marry. The contract to marry is by the law understood to be what is called an executory contract—that is, one that is to be carried out at a future time. It is, of course, one which can be entered into by any persons of legal contracting age, and a breach of the agreement may be defended by the averment that the contract was broken by mutual consent, or that discovery was made of deception on the part of the plaintiff in concealing material facts, such as another similar contract existing, or unchastity. If no such legal defense is set up for the breach of contract, a suit for damages lies, and the amount of damages demanded may be based in part on the relative wealth of the defendant, and upon the circumstances attending the case. It has been held that untruthful representations in regard to the wealth, social position, rank, profession, etc., of the plaintiff may constitute a lawful excuse for the breaking of a contract of marriage. See MARRIAGE.

Breach of Trust is the violation by a trustee of the obligations imposed upon him by the act or agreement laying the trust upon him. If his neglect of duty is accompanied by fraud or by gross negligence it may be punished as a criminal offense; otherwise it is a breach of duty, for which an action for damages will lie. It may be said that a breach of trust more often has in it a criminal element than an ordinary breach of contract, and the courts will scrutinize any failure to abide by the trust with great keenness, and will construe the obligations of a trust vigorously. See TRUST.

Breach of the Peace, any disturbance of the public order, as by an illegal tumult, a riot, or a general affray; the phrase is of more general application than a simple assault.

Breach of Pound, or *Pound Breach*, a misdemeanor consisting of the breaking into any pound (q.v.) and rescuing cows or cattle therein lawfully deposited and in the custody of the law. The statutes of the states which establish pounds impose specific penalties in the way of fine, and sometimes imprisonment, for such an offense.

Breach of Arrestment. In the Scotch law the process of arrestment answers to what is known in the law of England and the United States as either *garnishment*, or *stoppage in transitu*. Breach of arrestment is, therefore, the disregard of such a process, and it subjects the offender to an action for damages and costs, and also renders him liable to be proceeded against for contempt of court. *Breach of Duty* may be legally defined as either the non-execution of an office, or the performance of it in such a way that the conditions on which it is undertaken are violated.

BREACH OF THE PEACE, A. is in general any riotous behavior, or annoying conduct, such as fighting, shouting, disturbing others assembled or singly, etc. In common practice almost any conduct that can be called "disorderly" is in some sense a B. of the P. Unless occasioning some serious revolt, a B. of the P. is only a misdemeanor. See **BREACH**.

BREACH OF TRUST. See **TRUST**.

BREAD. The earliest and most primitive way of making B. was to soak the grain in water, subject it to pressure, and then dry it by natural or artificial heat. An improvement upon this, was to pound or *bray* the grain in a mortar or between two flat stones, before moistening and heating, and from this *braying* operation some etymologists propose to derive the word *bread* (as if *brayed*). A rather more elaborate bruising or grinding of the grain leads to such simple forms of bread as the *oat-cakes* of Scotland, which are prepared by moistening oat-meal (coarsely bruised oats) with water containing some common salt, kneading with the hands upon a baking-board, rolling the mass into a thin sheet, and ultimately heating before a good fire, or on an iron plate, called a *girdle*, which is suspended above the fire. In a similar manner, the barley-meal and peas-meal *bannocks* of Scotland are prepared; and in the East Indies (especially the Punjab and Afghanistan), as well as in Scotland, flour is kneaded with water, and rolled into thin sheets, as *scones*. The *passover cakes* of the Israelites were also prepared in this way. A similar preparation of wheat-flour, but where the sheet of dough is made much thicker, forms the *dampers* of Australia. The Indian corn-meal, kneaded with water and fired, affords the *corn-bread* of America. The kinds of B. referred to above are designated *unleavened*, as no leaven has been added to the dough to excite fermentation. Even in the time of Moses, however, *leaven* was employed in making bread. It is held probable that the Egyptians were the first to use leaven; that the secret afterwards became known to the Greeks; and that the Greeks communicated the process to the Romans, who spread the invention far and wide in the northern countries during their campaigns.

The grain of wheat is generally employed in the manufacture of B. among the better classes and more advanced nations, though rye, barley, Indian corn, and rice are also extensively used. The average composition of the grain of wheat when dried, so as to evaporate about 14 per cent of moisture, is—

Gluten and albumen.....	13½
Starch.....	54½
Gum, sugar, oil, and fiber.....	30
Saline matter.....	2

The proportion of these ingredients varies, however; and though the native country of wheat is unknown, yet it is found that within the wheat zone (see **WHEAT**), the quality improves as we travel south. Thus, Scotch wheat is inferior to English, the latter to French, that to the Italian; and the finest wheat in the world is grown in Barbary and Egypt. The principal constituents of wheat may be separated from each other without much difficulty. Thus, if wheat-flour be placed in a cloth-bag with the mouth well closed, and the whole introduced into a basin of water, and pressed by the fingers for some time, the starch is squeezed through the cloth as a fine white powder, and the gluten is left in the cloth as a viscid or sticky substance. Again, if wheat-flour be burned on a porcelain plate on a fire, or oven, or gas-lamp, till it can burn no longer, it leaves behind a small amount of ash or saline matter.

Previous to being employed in the fabrication of B., the grain of wheat undergoes the process of *grinding*, with the double object of reducing it to a fine state of division, and separating the more hard and indigestible parts. See **MILL**. During the grinding operations, the wheat as it passes from grain to flour nearly doubles its bulk. The products come from the dressing-machine divided into different qualities, a quarter of wheat yielding—

In the making of B. in Great Britain, the finest flour is employed in making *firsts* or the *fine 4-lb. loaf*; a coarser flour is made into *seconds* or household B.; and a still coarser into *thirds* or coarse bread. There is no bran in *firsts*, but a greater or less proportion of the finer bran in *seconds* and *thirds*. In the making of good B. three things are absolutely requisite: flour or meal, yeast or leaven, and water containing salt. The yeast (q.v.), or leaven (q.v.), is added to give a start to the fermentation (q.v.) process, thereby supplying carbonic acid, which communicates a spongy or light texture to the bread. Leaven is the more primitive ferment, and is simply a portion of moistened

flour or dough in which the putrefactive agencies have begun to work. It may be procured by allowing moistened flour to lie in a warm apartment (summer heat) for six or eight days, and when sufficiently formed, has an acid taste and reaction, and a somewhat fusty odor. When brought in contact with a new portion of flour and water, and incorporated therewith by kneading, it very quickly acts as a ferment, and develops partial fermentation in the whole. Hence it is that where leaven is used, it is customary to retain a portion of the leavened dough for the next baking. On the continent, leaven is still very extensively employed, especially in districts far from breweries. In America, yeast is generally used as the ferment.

The materials being at hand, and the proper benches, utensils, and oven being within reach, the baker takes a quantity of water and adds to it the yeast and salt; after which the flour is added, and the whole thoroughly and laboriously kneaded together till it assumes a ropy consistence. It is then called the *sponge*, and is placed in a kneading-trough in a warm place, which is styled *setting the sponge*. In a short time, the yeast begins to act on the gluten, starch, and sugar of the flour, compelling the latter to pass into alcohol and carbonic acid gas in every part of the dough, which thereby becomes inflated with innumerable air cavities. When the fermentation has sufficiently advanced, the baker takes the sponge, adds more flour, water, and salt, and a second time subjects the whole to a thorough process of kneading, to prevent portions being so far fermented as to become *sad*, and again allows the mass to lie in a warm place for a few hours. The dough swells considerably from distension by gas, and is weighed out into lumps of the proper size, which are shaped into loaves, constituting the *batch*, or placed in tin pans, and are allowed to lie for a short time till they get further distended. The oven has previously been heated by flues, by heated air, or by wood being burned within it, to a temperature of at least 320° F., which is the lowest temperature at which B. can be baked, and ranging up to 572° F.; and when it has been thoroughly cleaned out, the loaves are introduced and placed on the floor, and the oven shut up. The heat acts in dissipating much of the water from the dough, in distending the air cavities more fully, and in partially *boiling* the starch and gluten of the dough, and developing some gum from the starch. Indeed, though the temperature of the oven is much higher, yet the loaves beyond the mere crust are bathed in an atmosphere of steam, and are never heated above 212°, as has been proved by direct experiments with the thermometer. One effect of the heat is to arrest any further fermentation (q.v.; see also YEAST). After several hours' baking in the oven, the length of time being determined by the temperature, the loaves are withdrawn, and allowed to cool. The brown appearance of the crust of loaves, and the pleasant taste of the crusts, are due to the action of the heat on the starch and the formation of dextrine (q.v.), a sort of gum. The number of quartern (4 lb.) loaves which a sack of flour weighing 280 lbs. yields, is 90. It will be apparent, therefore, that as 280 lbs. of flour yield 360 lbs. of B., that a good deal more water must be present in the latter than in the former; and indeed, ordinary good wheaten B. contains about 45 per cent of water. This water is retained even after the loaf is apparently dry, and even mealy, as the gum and gluten have a great affinity for water.

Improvements in the process of making B. are occasionally effected. Thus a form of yeast, called German barm or yeast (q.v.), has been introduced, which is more cleanly than ordinary yeast or leaven, but appears to be too rapid in its power of causing fermentation to be manipulated easily in the making of ordinary loaves, though it does well for pan-loaves and fancy B. in general. Ovens heated by flues are being constructed, instead of the primitive method of heating them by wood, which smokes the whole oven. Instead of raising the dough by the action of yeast, which decomposes a part of the flour and causes the loss of about 2 per cent, bicarbonate of soda and hydrochloric acid are sometimes employed. The proportion by this process are 4 lbs. of flour intimately mixed with 320 grains of bicarbonate of soda; to this is added a mixture of 300 grains of common salt in 35 ozs. of water and 6½ fluid drams of hydrochloric acid, sp.gr. 1.16, and the whole is kneaded and placed in the oven. When the mixture is made, the acid acts on the bicarbonate of soda, forming common salt, which is left in the dough, and carbonic acid is liberated at every point, and communicates a spongy texture to the dough. The disadvantage attendant on this mode of raising the dough is that it is apt to leave too much common salt in the bread. This is obviated by using water charged with carbonic acid, as described under AERATED BREAD. Sesquicarbonate of ammonia is employed to some extent in the preparation of rusks, gingerbread, and other light fancy B.; when heated, it entirely passes into gas, and thus yields a very spongy mass. *Short-bread* is prepared from flour which has been incorporated with butter. See AERATED BREAD; BAKING POWDERS.

The appearance which good wheaten B. ought to present, is that of a vesicular or spongy mass, from which layers can be readily detached; and this, known to bakers as *piled B.*, is the best index of good wholesome and easily digested bread. When the layers cannot be detached, and the loaf cannot be crumbled down by the fingers into a coarse powder, or the fragments be thoroughly soaked and be readily diffused through water, but become a permanent tough mass of dough, the B. is imperfectly made.

Rye B. is very extensively used in northern European countries, where the soil being sandy is admirably adapted for the growth of that grain. It yields a flour darker than

wheat-flour. It is almost equal in nutritive value to wheaten bread. Barley and oats, which when used as B. are generally made into cakes or bannocks, possess also a composition not unlike wheat. Indian corn, which thrives luxuriantly on the American soil, and is largely used here for B., as also to a considerable extent in the old world, is little different from wheat in the proportion of its ingredients. Rice is occasionally employed in making B., but it is not nearly so nutritious as wheat.

But although, with the exception of rice, the various kinds of grain do not sensibly differ in the amount of nutritious matter contained in the meal, yet there is a great difference as to the quality of yielding a light, spongy bread. In this respect, the flour of wheat excels all others. This quality seems to depend upon the mechanical structure of the gluten of wheat, which gives a glutinous, sticky consistency to the dough, rendering it impervious to the carbonic acid gas formed in it during the fermentation, so that the gas thus imprisoned swells it up. The meal of other grains forms a more granular and less tenacious dough, which allows the gas to escape with more or less ease as it is formed. It is thus impossible to make a light, spongy loaf of oatmeal, however finely it might be ground. In the case of whole-meal B. or brown B., the rough, hard particles of the bran interfere with the ordinary tenacious quality of wheaten-flour, and make the dough slightly porous, so that much of the gas escapes, and thus this kind of B. is never so much raised as B. of fine flour.

BROWN, COMPOSITION, or GRAHAM BREAD is made from the ground but undressed wheat, and therefore contains the bran as well as the flour. The whole meal (bran and fine flour) contains chemically more nutritive matter than the fine flour alone, yet the gritty particles that are present in the former cause an incessant irritation in the alimentary canal, and lead to a quicker evacuation of the but partially digested and absorbed food.

The *adulterations* of B. are various. Very commonly boiled potatoes are added to the flour and water in the making of the dough, and some consider that this yields a lighter and more palatable bread. It must be remembered, however, that the addition of any substance of a nature foreign to the composition of any material, however nourishing, is an adulteration, and that though potatoes may be supposed to improve the B., yet good B. can be made without them, and the addition of the potatoes lessens the nutritive value of the wheat-flour. Alum is occasionally added to the dough, to increase the whiteness and improve the general texture of the B.; and this it appears to do by arresting the passage of the starch into gum and sugar, which tends to take place during the process of baking. In Belgium, sulphate of copper is often used for a similar purpose. In Great Britain, B., except French rolls and fancy B., must be sold by weight only; the laws specify the requisite ingredients, and heavy penalties are imposed for adulteration. In most of the United States the statutes relating to food generally provide for punishment for the sale of adulterated articles, but are much more general than the English statutes. There are no specific enumerations of the requisite ingredients of B. There is usually appointed a public inspector and analyst, and goods suspected of adulteration must be submitted to his tests. See NUTRITION, Food, BISCUIT.

BREADALBANE, a mountainous district of Scotland, comprising the western part of the county of Perth. The chief proprietor is the Marquis of Breadalbane, a descendant of Sir Duncan Campbell of Lochow, created Lord Campbell in 1445. See CAMPBELL.

BREAD-FRUIT TREE, *Artocarpus incisa*, a tree of the natural order *artocarpaceæ* (q.v.), a native of the islands of the Pacific ocean and of the Indian archipelago—one of the most important gifts of nature to the inhabitants of these regions, its fruit supplying the principal part of their food, and its inner bark a considerable part of their clothing, whilst its timber and its milky juice are also employed for economical purposes. The genus to which it belongs (*artocarpus*, Gr., bread-fruit) is distinguished by having the male flowers in catkins, with a 2-leaved perianth and one stamen; the female flowers naked; the fruit roundish, fleshy, and tuberculated. The bread tree is a rather slender tree, of 40 to 50 ft. high, often rising almost half its height without a branch. It has large, pinnatifid leaves, frequently 12 to 18 in. long, dark green, and glossy. The fruit is generally oval, or nearly spherical, and about the size of a child's head. It is a *sorosis*, a compound or aggregate fruit formed from numerous flowers on a common axis, and is covered with a roughish rind, which is marked with small square or lozenge-shaped divisions, having each a small elevation in the center; is at first green; when imperfectly ripened, brown; and when fully ripe, assumes a rich yellow hue. It is attached to the small branches of the tree by a short thick stalk, and hangs either singly or in clusters of two or three together. It contains a somewhat fibrous pulp, which, when ripe, becomes juicy and yellow, but has then a rotten taste. At an earlier stage, when the fruit is gathered for use, the pulp is white and mealy, and of a consistence resembling that of new bread. In a still less mature state, the fruit contains a tenacious white milk. The common practice in the South Sea islands is to cut each fruit into three or four pieces, and take out the core; then to place heated stones in the bottom of a hole dug in the earth; to cover them with green leaves, and upon this to place a layer of the fruit, then stones, leaves, and fruit alternately, till the hole is nearly filled, when leaves and earth to the depth of several inches are spread over all. In rather more than half an hour, the bread-fruit is

ready; "the outsides are, in general, nicely browned, and the inner part presents a white or yellowish cellular pulpy substance, in appearance slightly resembling the crumb of a wheaten loaf." It has little taste, but is frequently sweetish, and more resembles the plantain than bread made of wheat-flour. It is slightly astringent, and highly nutritious. Sometimes the inhabitants of a district join to make a prodigious oven—a pit 20 or 30 ft. in circumference, the stones in which are heated by wood burned in it, and many hundred bread-fruits are thrown in, and cooked at once. Baked in this manner, bread-fruit will keep good for several weeks. Another mode of preserving it is by subjecting it in heaps to a slight degree of fermentation, and beating it into a kind of paste, which, although rather sour, is much used when fresh bread-fruit cannot be obtained. There are numerous varieties of the bread tree in the South Sea islands, and they ripen at different seasons. The tree produces two, and sometimes three, crops a year. In the West Indies and South America, into which it has also been introduced, the bread-fruit has not come much into use as an ordinary article of food; but various preparations of it are reckoned delicacies.—The fibrous inner bark of young bread-fruit trees, beaten and prepared, is used for making a kind of cloth, which is much worn by the common people in the South Sea islands, though inferior in softness and whiteness to that made from the paper mulberry (see MULBERRY, PAPER).—There exudes from the bark of the bread tree, when punctured, a thick mucilaginous fluid, which hardens by exposure to the air, and is used, when boiled with cocoa-nut oil, for making the seams of canoes, pails, etc., water-tight, and as bird-lime.—The timber is soft and light, of a rich yellow color, and assumes, when exposed to air, the appearance of mahogany. It is used for canoes, house-building, furniture, and many other purposes. It is durable when not exposed to the weather.—The JACK (q.v.) or JACA (*A. integrifolia*), and the DEPHAL (*A. lakoocha*), both large East Indian trees, belong to the same genus with the bread-fruit tree.

BREAD-NUT, the fruit of *brosimum alicastrum*, a tree of the natural order *artocarpacea*, and therefore allied to the bread-fruit, a native of Jamaica. The genus *brosimum* is distinguished by male and female flowers on separate trees, in globose catkins, with peltate (shield-like) scales for perianth, and the fruit a one-seeded drupe. The bread-nut tree has ovate-lanceolate evergreen leaves; it abounds in a tenacious gummy milk. Its leaves and young shoots are much eaten by cattle, but deleterious qualities are developed in them as they become old. The nuts, boiled or roasted, form an agreeable article of food, and are eaten instead of bread. Their taste resembles that of hazel-nuts.—To this genus the *palo de vaca*, or COW TREE (q.v.), of Demerara is supposed also to belong.

BREAD-ROOM. In the navy, the biscuits are called *bread*, and the place where they are stored is the bread-room; it is carefully constructed, warmed before being filled, and kept as much as possible free from damp.

BREAD-ROOT. See PSORALEA.

BREADTH, in art, is a term which, though often used in a very indefinite manner, is not without a definite meaning. It signifies that peculiar disposal of the background of a picture which, without sacrificing or even concealing details, gives to the whole unity and harmony of effect. With the older landscape-painters, it was a common fault to produce the effect of distance either by a certain trick of light and shadow, or by one uniform hazy color in which the individual objects were entirely lost to view, and *breadth became vacancy*. In this respect, their pictures contrast unfavorably with those of such modern painters as Turner, of whom Mr. Ruskin has very truly said that "the conception of every individual inch of distance is absolutely clear and complete in the master's mind—a separate picture fully worked out: but yet, clearly and fully as the idea is formed, just so much of it is given, and no more, as nature would have allowed us to feel or see; just so much as would enable a spectator of experience and knowledge to understand almost every minute fragment of separate detail, but appears to the unpracticed and careless eye just what a distance of nature's own would appear—an unintelligible mass. Not one line out of the millions there is without meaning, yet there is not one which is not affected and disguised by the dazzle and indecision of distance. No form is made out, and yet no form is unknown." On the subject of breadth Mr. Ruskin has, moreover, the following very judicious remarks: "It were to be wished that our writers on art would not dwell so frequently on the necessity of breadth, without explaining what it means, and that we had more constant reference made to the principle, which I can only remember having seen once clearly explained and insisted on—that breadth is not vacancy. Generalization is unity, not destruction of parts; and composition is not annihilation, but arrangement of materials. The breadth which unites the truths of nature with her harmonies is meritorious and beautiful, but the breadth which annihilates those truths by the million is not painting nature, but painting over her; and so the masses which result from right concords and relations of details are sublime and impressive, but the masses which result from the eclipse of details are contemptible and painful."

BREAD-TREE. See CAFFER BREAD.

BREAKERS, in maritime language, are the waves that break violently over rocks lying a short distance under the surface of the sea. They cover that particular part of

the sea with a foam, and produce a hoarse and often terrible roaring. "Breakers ahead" is one of the most alarming announcements made by the lookout men of a ship, seeing that the B. denote the existence of sunken rocks which may, perchance, pierce the hull of the vessel.

BREAKING BULK, in the Scotch law, signifies making use of an article supplied in bulk, or in quantity; by which act one is said to break bulk, and is, in consequence, prevented from afterwards objecting to it, and returning it to the seller. See **SALE OF GOODS**.

BREAKING INCLOSURES is an expression to be found in Scotch law-books, and means the destruction or invasion of planting and inclosures by persons or their cattle. The punishment for this offense is provided for by several old Scotch statutes, the principal of which are two passed in 1661 and 1685 respectively. The penalties are pecuniary, with right to detain the cattle found trespassing, until such penalties, along with the damage and costs, are paid. See **PLANTATION**.

BREAKWATER is a barrier intended for the protection of shipping in harbors or anchorages. It sometimes happens that, in front of a semicircular bay, a small island is so situated as to form a natural breakwater. This is to some extent the case with the Isle of Wight, which occupies such a position as to protect Portsmouth and Southampton from the south. In many other places, however, bays and harbors are without such screens. A pier may be so placed and constructed as to serve also the purpose of a B., but the term B. is generally confined to a structure used solely for protection, and not for berthage or traffic, and breakwaters are frequently insulated, so as to be cut off from any communication with the shore unless by water.

Plymouth B. is the best known of these engineering works. The sound or harbor, being open to the s., was so much exposed to storms that, early in the present century, it was determined to construct a B. across its mouth, with openings between it and the shore, on either side, for the ingress and egress of shipping. The works were commenced in 1812. The operations consisted in transporting along a tram-road large blocks of limestone got from a neighboring quarry, shipping them in vessels fitted with trapdoors, and by means of these depositing them in the shape of a huge mound in the required situation. As soon as the stones began to appear above water, a perceptible benefit resulted in the relative calmness of the sound during the prevalence of storms; but the structure was frequently very roughly handled by the waves, which altered and flattened its shape. A severe storm in Nov., 1824, threw a great portion of the stones over into the sound. It was not until 1841 that the works were finally completed, by the deposition of more than 3,000,000 tons of stone, and the expenditure of nearly £1,500,000. The B. is nearly a mile long, the central portion is 1000 yards; and two wings, of 350 yards each, extend from the ends of this at a slight angle. The open channels at each end, between the B. and the shore, are each about half a mile wide, and their depth is respectively 40 and 22 ft., at low water. The B. is 133 yards wide at the base, and 15 at the top—the two sides being made very sloping for the security of the stones. The slopes and top are faced with masonry. The water-space protected by this B. comprises 1120 acres, and it is generally admitted that the money has been well spent on the work.

Holyhead B. is formed of stone quarried in Holyhead mountain, drawn along a tramway on a timber structure, and cast into the sea. It more resembles a pier than the B. at Plymouth, for it is attached at one end to the shore, and is intended to convert Holyhead bay or roadstead into a harbor of refuge. The works consist of a mound of loose stones up to low water, and ashlar upright walls with a parapet above that line, with a railway on the top for trains.

Portland B. is of very great value, in converting into a harbor of refuge the expanse of water between the Dorsetshire coast and the isle, or rather peninsula of Portland. An act of parliament was obtained in 1847, authorizing the works. The B., starting from the n.e. point to the isle, stretches nearly due n. for more than 2 m., with one or two intervening openings for the ingress and egress of shipping. The works were conducted more easily than those of any other great B.; for the isle contains an abundance of stone easily quarried, and the steep shores afforded facility for transporting the stones by their own gravity to their destination. The work—which is an upright ashlar superstructure, with a parapet founded on a mound of rubble stones—was done chiefly by convict labor; the depth is about 50 ft. at low-water. From the nature of the operation, any part of the B. became useful as soon as constructed, increasing the safety of Portland bay as a harbor of refuge.

Dover B. progresses slowly, and has involved an enormous outlay. There is no stone near to form a mound, as in the other breakwaters spoken of, and, in consequence, the work requires to be brought up in solid ashlar from the bottom by the diving-bell, with the interior formed of blocks of concrete. It has never been clearly stated whether the government regards this B. as a protection to a great naval station and fortified harbor, or as a chief feature as a harbor of refuge for commercial fleets. In 1844, a commission of inquiry recommended that £2,500,000 should be laid out in forming a harbor of refuge at this place. In 40 years the work has not been finished, the great depth and frequent storms constituting terrible obstacles. The water is very deep—viz., 42 ft. at low-water; the

accumulations of shingle very troublesome, and several years must elapse before it can be made evident whether the Dover B. is worth the national money expended upon it. Alderney B. is a great work, consisting of ashlar walls and parapet, built on a stone mound up to low-water from a depth of 72 feet.

Cherbourg B. is the greatest and the most costly ever constructed. More than 100 years ago, M. de Cessart proposed to the French government the formation of a B. at Cherbourg, to be commenced by the construction of a number of hollow cones formed of timber-framing, sunk in a line as close as they could be placed to each other, and then filled with stones. These cones, of which there were to be 64, each about 70 ft. high, 150 ft. in diameter at the base, and 60 ft. at the top, were intended to form a nucleus to the stone breakwater, to prevent the stones, during its formation, being knocked about and too much spread out by the action of the waves. In 1784 to 1788, 16 cones were constructed, and 13 of them sunk; but so great was the destruction which they underwent during stormy weather, that the government at length abandoned the plan, and carried on the stone breakwater without the aid of the cones. It was completed under Napoleon III. at a cost exceeding £2,500,000. The B. itself was finished in 1853, but since that year large fortifications have been built upon the upper works. The length is nearly 2½ m.; the B. is 300 ft. wide at the bottom, and 31 at the top. The chief mass consists of rubble or unshaped stones, thrown down from ships; but there is a larger ratio of wrought and finished masonry than in the Plymouth B., consisting of granite blocks imbedded in cement. The depth of water is about 60 ft. at low-water spring-tides; and the B. rises to 12 ft. above high-water level. The water-space included within and protected by the B., is about 2000 acres, but two thirds of this has scarcely depth enough for the largest-sized ships. The relation which this B. bears to the vast military and naval arrangements of the place will be noticed under CHERBOURG.

The introduction of concrete made of Portland cement has greatly modified and simplified the construction of breakwaters. The cement is mixed with sand, gravel and broken stone in various proportions according to exposure; 1 of cement to 7 of other materials being a common proportion. Sometimes breakwaters are made by depositing large concrete rocks of 20 to 50 tons weight, in *pierres perdues* style, from the bottom up to a little above low-water, and then forming a monolithic mass of concrete above, such as the B. at St. Jean de Luz. Sometimes the concrete is lowered down inclosed in large bags; or it may be lowered down in boxes with hinged bottoms and deposited in mass on the bottom, either within timber casing, or even without any protection at all.

Many substitutes have been proposed for solid breakwaters, such as floating breakwaters constructed of timber framework, open iron screens, etc., but none of them have been shown to be suitable for actual practice. Close timber-work, filled in with stones, is found to be quite efficacious; but on most of our coasts the timber is liable to be eaten by the marine worm, which is an objection to its being used under water.

In the United States the most important work of the kind is at Lewes, Del., at the entrance of Delaware bay. A breakwater was resolved upon in 1828, and the next year the site was fixed at cape Henlopen. In 1870, the engineer reported the completion of the harbor "according to the original project devised more than 40 years ago." In the year after the completion more than 20,000 vessels visited the harbor. Its present capacity is determined by the space that is sheltered by the B. proper. This is a straight line nearly half a mile long, and may be taken as the diameter of a half circle behind it, the area of which will represent approximately the sheltered harbor. Northeast of the B. is the ice-breaker structure, a quarter of a mile in length, with an opening of about the same extent, through which the sea rolls without hindrance. It is altogether of stone, in rubble-wall and more finished work. There are several breakwaters in the northern lakes, and a very costly one at Galveston, Tex., finished in 1887.

BRÉAL, MICHEL JULES ALFRED, an eminent French philologist, born at Landau, in Rhenish Bavaria, March 26, 1832. He was educated at Weissenburg, Metz, and the Lycée St. Louis, where he developed a remarkable aptitude for linguistics, and finished his studies at Berlin, under Bopp and Weber. Returning to Paris he received charge of the Oriental manuscript department in the Imperial Library; and the chair of Comparative Grammar at the Sorbonne becoming vacant in 1846, obtained the appointment, but was transferred to the College of France two years later. Prof. Bréal's writings are both numerous and important; his *Étude des Origines de la Religion Zoroastrienne* received the prize of the Academy in 1862. Other important works are *De la Méthode comparative appliquée à l'étude des langues*; *Hercule et Cacus*, a study of comparative mythology; a valuable treatise on the Umbrian language, for which the Italian city of Gubbio presented him with citizenship; and *La Réforme de l'Orthographe Française* (1890). Bréal also translated into French, Bopp's great work on *Comparative Grammar*, with a learned introduction and notes. Many of his shorter writings were published in the *Revue Critique*, of which he was one of the founders and directors. In 1875, he was elected member of the Institute, and four years later appointed Inspector General of Public Instruction.

BREAM, a name which is apt to occasion some confusion to beginners in ichthyology, being applied equally to certain fresh-water fishes of the family cyprinidae (q. v.), and to certain sea-fishes of the families sparidae (q. v.) and chaetodontidae (q. v.) or squamipennes.

among which the resemblance is a mere general one of outward form, the first of these families belonging to the order of *malacopterous*, or soft-finned, the other two to that of *acanthopterous*, or spiny-finned fishes.

The breams of the family *cyprinidæ* were included in the genus *cyprinus* (see CARP) by the older naturalists, but are readily distinguished from that genus as now defined, and from other allied genera, by their deep and compressed form, by the great convexity of both the dorsal and the abdominal outline, by the want of spiny rays in the dorsal and anal fins, by the great length of the base of the anal fin, and by the want of cirri or barbules at the mouth. They form the genus *Abramis* of Cuvier.—The COMMON B., or CARP B. (*A. brama*), is an inhabitant of many rivers and lakes of Europe, even as far n. as Norway and Sweden, and of some of those of Britain and Ireland. It thrives best in still waters, and in some of the Irish lakes attains a large size; it has been known to reach 12 or even 14 lbs. The tail is very broad and much forked, the head small and acuminate, the eyes very large, the scales small, the general color yellowish-brown, the cheeks and gill-covers silvery-white.—The WHITE B., or BREAMEFLAT (*A. blicca*), differs from the common B. in its silvery color, the smaller number of rays in the pectoral and anal fins, and other particulars. It has never been taken of so large a size. It is found in many parts of the continent of Europe, and in some of the British lakes and rivers.—The POMERANIAN B. (*A. bugghagii*) differs much more widely from the common B.; the body is much thicker in proportion to its depth, the scales larger, the base of the anal fin shorter, the tail less forked. This fish is known to occur in a few places of England and Ireland, and is said to abound in Pomerania.

The acanthopterous breams, or SEA BREAMS, are mostly of the family *sparidæ*, and nearly allied to the gilthead (q.v.), in connection with which they may most properly be noticed. The common sea B., indeed, often receives the name of gilthead.

Angling for Bream.—Of the two kinds of B. known to anglers, the carp B. is much the best for sport. The flesh of the B. is not held in much estimation, though the carp B. is infinitely to be preferred of the two. B. are found in both ponds and rivers. They prefer deep, still holes, or quiet, well-sheltered eddies in the bends of rivers. Here the angler will find them in large numbers. They are rather capricious in feeding; at times they will not bite for weeks together. Being a sly, shy-biting fish, the tackle required for them must be fine. They may be captured by means of the ledger in rivers, where they should be fished for in the same way as directed for barbel, save that it will be found advisable to use another hook, which should be fastened on to the line about 8 in. or a foot above the ledger lead, as B. often take their bait some inches off the bottom. The hooks should be No. 7. In float-fishing for B. in holes or eddies, a stout swan-quill float and half a dozen No. 1 shot below it, will be found sufficient for the purpose; and, having ground-baited as directed for barbel, put on two small red worms for the angling bait, or about an inch of the tail of a bright, well-scoured lob-worm. The former is preferable. Two hooks, one to rest on the bottom, and one 6 or 8 in. off it, will be found useful, for sometimes one will be taken, and sometimes the other. The fish being tender-mouthed, should be played gently.

BREAMING, in nautical affairs, is a cleansing process which a ship undergoes after a voyage, or after lying for a long time in harbor. The ship's bottom, under such circumstances, often becomes covered with grass, ooze, shells, or sea-weed; and B. consists in the removal of these impurities. The ship is laid aground after the tide has ebbed, or is docked, or is careened (see CAREENING); furze and fagots are placed under it; fire is applied; the heat melts the pitch, etc., of the hull, and the pitch and filth can then be scraped and brushed off.

BREAST, THE FEMALE, or mammary gland, consists of a series of tubes, radiating from a common center, the nipple, which is situated in an areola or dark-colored patch. On the surface of the latter are several (from 4 to 10) sebaceous glands, which secrete an unctuous fluid to protect the skin of the nipple, which is very thin, from the saliva of the sucking infant. The milk-tubes (15 to 18 in number) enlarge into *sinuses*, and pass each to a separate lobe or subdivision of the breast, where they divide into twigs and branches (the *lactiferous ducts*), which end in minute vesicles. The lobes are held together by fibrous tissue, and are well packed in fat, which increases sometimes to an enormous extent the apparent size of the organ. It will be readily understood how over-distension of these delicate tubes, from whatever cause, must be productive of great suffering. When an abscess forms in the B., it is very dangerous to allow the matter to remain; but when an opening is made into an abscess of the B., the cut must be made in some line radiating from the nipple, so as to avoid division of the milk-tubes.

BREASTPLATE, in ancient armor, was a plate of iron, steel, or other metal, so fastened as to protect the chest or front of the wearer. The back-plate, in like manner, was worn to protect him from attack from behind. In modern European armies, almost the only representative of the B. is the front half of the *cuirass*, worn by the *cuirassiers* in certain foreign states, and by the household cavalry (life-guards and horse-guards) in England.

BREAST-SUMMER, BRESSUMER (Fr. *sommier*, a lintel), a beam supporting the whole front of a building, in the same way in which a lintel supports the portion over an

opening. They are seen in England and on the continent in old houses that are built partly of wood and partly of stone, brick, or mud.

BREAST WHEEL. See WATER POWER.

BREASTWORK, in fortification, is a hastily constructed earthwork; not so high as to need a *banquette* (q. v.) for the defenders to stand upon, but sufficient to afford shelter when they are standing on the level of the ground, and firing over the crest. The dry ditch or trench from which the earth has been taken to form the B., affords an additional defense. A B. is midway between a *parapet* and an *épaulement*, in size and importance. See *illus.*, **FORTIFICATIONS**, vol. VI.

BREATH, OFFENSIVE, may depend upon some cause limited to the mouth or nose, or it may arise from diseased conditions of the respiratory or digestive apparatus. If, from want of proper attention, the teeth have collected a quantity of putrescent particles around them, they must be well scrubbed with a brush and tepid water, with some powdered carbonate of magnesia mixed with it. A wash composed of a teaspoonful of tincture of myrrh in a pint of water is also very useful. Occasionally the secretion from the tonsils is very offensive; and then a solution of nitrate of silver, 4 grains to 1 ounce of water, should be applied to them every morning, with a camel-hair brush, and small alterative doses of medicine administered. Solutions of soda in water are also very useful. Should the fetid smell arise from a portion of dead bone, the latter must be removed whenever it becomes loose. Inhalations of steam from hot water into which some creasote has been dropped, is much recommended for cases in which the cause resides in the nose and respiratory passages. When, however, it is caused by digestive derangements, the treatment should consist in purging, to empty the intestinal canal, followed by soda, to correct acidity, and tonics, of which the bitter infusions and tinctures, and the dilute mineral acids, are among the best.

All medical treatment is unavailing to correct the foul odor which rises from the stomach of the habitual drunkard, or from the victim of gangrene or abscess in the lungs.

BREATH AND BREATHING. See RESPIRATION.

BREATH FIGURES. See COHESION FIGURES.

BREATHITT, a co. in e. Kentucky; 450 sq.m.: pop. '70, 5652—181 colored; in '90, 8705. The co. is hilly, with forests, and has iron and coal; but the main productions are agricultural. Co. seat, Jackson.

BREBEUF, JEAN DE, b. France, 1593; killed in the Huron country in 1649; a Jesuit missionary who came with Champlain in 1626. His labors were mainly among the Hurons, with whose life and language he became very familiar. When the town of St. Louis was taken by the Iroquois, B. and Lalemont, his associate, were made prisoners and tortured to death. It is said that B.'s head is preserved in the pediment of a silver bust in the convent of the hospital nuns in Quebec. Some of his writings on the Huron language are preserved, and were translated by Albert Gallatin.

BRECCIA, a term adopted from the Italian to designate a mass composed of angular fragments of rocks of the same or more different kinds, cemented together by an enveloping paste, or by infiltrated iron or carbonate of lime.

BRECHE-DE-ROLAND, a defile of the Pyrenees, between France and Spain, about 11 m. s. of St. Jean de Luz, with an elevation of about 9500 ft. above the sea. It is a difficult passage of from 200 to 300 ft. in width, between precipitous rocks rising to a height of from 300 to 600 feet.

BRE'CHIN, a t. of Forfarshire, on the left bank of the South Esk, 8 m. w. of its junction with the sea at Montrose. Pop. '91, 8955. It unites with Montrose, Arbroath, Forfar, and Bervie in returning one member to parliament. Spinning, bleaching, distilling, and brewing are carried on here, as also the manufacture of linens and sailcloth. B. was once a walled town. David I. founded a cathedral and bishopric here in the 12th century. Part of the cathedral, built chiefly in the 13th, 14th, and 15th centuries, is now the parish church. Close to the church is a round tower of a Culdee college, similar to the Irish ones and to the one at Abernethy, the only other example in Scotland. The tower is 87 ft. high, 25 ft. in diameter at the base, and 12½ ft. at the top, and it is surmounted by a 15th c. spire of 25 feet. It dates from about the year 983. B. castle, the ancient seat of the Maules (now of their representative, the earl of Dalhousie) was taken by Edward I. in 1303, after a siege of 20 days. B. was burned by Montrose in 1645.

BRECK, JAMES LLOYD, 1818-76; b. Philadelphia; educator. He was educated under the Rev. Dr. Muhlenberg, and at the General Theological Seminary; joined a mission for work among the Indians on the western frontier in 1841; and spent the remainder of his life in organizing and conducting Protestant Episcopal schools.

BRECKENRIDGE, a co. in n.w. Kentucky, on the Ohio river, 502 sq. m.; pop. '90, 18,976; undulating surface, well watered and fertile. There are some curious sink-holes and caves in the co.; and there are various medicinal springs. Chief productions, agricultural. Co. seat, Hardinsburg.

BRECKENRIDGE, JOHN, D.D., 1797-1841; b. Ky.; a Presbyterian minister, graduate of Princeton college. In 1822 he was licensed to preach, and soon afterwards served as chaplain in congress. His first church was in Lexington, Ky., where he established a newspaper, *The Western Luminary*. In 1831 he removed to Philadelphia and was secretary and general agent of the Presbyterian board of education; subsequently professor in Princeton theological seminary; and in 1838 secretary and general agent of the board of foreign missions. He resigned in 1840, and just before his death was chosen president of Oglethorpe university, in Georgia.

BRECKENRIDGE, JOHN CABELL, b. Ky., 1821; studied law in Transylvanian university, and settled at Lexington. He was a member of congress from his state for several terms; and in 1856 was elected vice-president. In 1860 he was nominated for president by the extreme southern section of the Democratic national convention, but, with Douglas and Bell, was defeated by Lincoln. He was immediately chosen U. S. senator, but abandoned his seat and went with the secessionists, where he entered the army and became a maj.gen. In 1865, just before the collapse of the rebellion, he was appointed confederate secretary of war. At the close of the conflict he went to Europe, where he remained several years. He died in 1875.

BRECKENRIDGE, ROBERT JEFFERSON, D.D., brother of Rev. John, 1800-71; b. Ky.; at first a lawyer and member of the legislature; but in 1829 he joined the Presbyterian church, and in 1832 became pastor of the first Presbyterian church in Baltimore, where he officiated for 13 years. In 1845, he became president of Jefferson college; two years later removed to Kentucky and became state superintendent of public instruction. In 1853, he was professor of theology in Danville seminary. Dr. B. was a strong old-school leader in the great division of the Presbyterian church. In the slavery discussions he was extreme on neither side, and when the civil war began he was for the union, but he was much opposed to the emancipation proclamation. In 1864, he was president of the convention that nominated Lincoln for a second term. Dr. B. is credited with being the principal author of the common school system of Kentucky. Among his works are *Internal Evidences of Christianity*; *Papism in the United States*; and some books of travel.

BRECK'NOCKSHIRE, or BRE'CON, an inland co. of South Wales, to the s. of Radnor, from which it is separated by the Wye. Length, about 35 m.; average breadth, 20. Area, 734 sq.m., of which two thirds are cultivated. B. is one of the most mountainous counties in South Wales, and has deep, beautiful, and fertile valleys. Two principal mountain-chains, the highest in South Wales, rising with Brecknock peaks to a height of 2862 ft., intersect the county in the n. and s., and occupy, with their offshoots, a great part of the surface. Old red sandstone occupies the s. and middle of the co., and silurian rocks the north. The chief rivers are the Wye, Usk, Yrfon, Elan, Claerwen, and Tawe. The climate is severe and rainy but healthy among the mountains, and in the valleys comparatively mild. The agriculture, though still defective, especially in the higher districts, was greatly improved by the Brecknockshire agricultural society, instituted in 1755. The chief crops are oats and barley, but much wheat is also grown in Talgarth and Crickhowell, the most fertile districts of the county. In the valleys in the e. some hops are raised, and some orchards are seen. The native small black-cattle are reared in the hills, while in the lowlands the Hereford breed predominates. The mineral produce is small, consisting of iron, especially along the s. border; coal and limestone are found in the south and west. Lead ore is also mined, and slate is found at Crom Yrfon. The Brecon canal connects the co. with the Bristol channel, and many railways have been constructed throughout the county. There are several important iron-works, but the ore is chiefly obtained from adjoining counties. B. returns one member to parliament. Pop. in 1891, 51,393. The chief towns are Brecon, the co. and only corporate one, Builth, Crickhowell, Hay, and Llanelly. There are many remains of British and Roman camps, Roman roads, cairns, cromlechs, mounds, and castles throughout the county. B. formed part of the territory of the Silures, who bravely withstood the Romans. The Normans, under Barnard Newmarch, wrested the co. from the Welsh princes in 1092. Llewelyn, the last British prince of Wales, was killed in this co. in 1282, and by his fall the native mountain-chiefs were entirely subdued. Half the people in B. still speak Welsh.

BRECON, BRECKNOCK, or ABERHONDDU, the capital of Brecknockshire, South Wales, is situated in an open valley in the middle of the co., at the confluence of the Usk, Honddu, and Tarell, 171 m. w.n.w. of London. It lies in the midst of fine mountain scenery, and has beautiful public walks. South of B. lie the three mountain-peaks, the Brecon beacons. Pop. '91, 5600. It returns one member to parliament. There is a considerable trade in lime, which abounds in the neighborhood. Barnard Newmarch, a relative of William the conqueror, founded the town, and built a castle here in 1094. He also founded two priories here in the reign of Henry I. Henry VIII. turned one of the priories into a college, still existing; the other is now the parish church. B. was formerly surrounded by a wall, having ten towers and five gates. Hugh Price, founder of Jesus college, Oxford, and Mrs. Siddons, the celebrated actress, were natives of Brecon.

BREDA, a t. of North Brabant, Holland, situated at the confluence of the navigable rivers Merk and Aa, and containing (Jan. 1, 1896) 24,651 inhabitants. It formerly pos-

possessed the means of laying the surrounding country under water in the event of an attack, but the importance of the town, as a military position, has passed away, and in 1876 the fortifications were removed. It has a Gothic cathedral, with a lofty tower and several interesting monuments; also an old castle built in 1350, which was for some time the residence of Charles II. of England, and is now a military academy. There are manufactures of carpets, linen, hats, soap, leather, etc., and dye-works, breweries, and rope-walks. It is celebrated as the place where, in 1566, the protest of the Dutch nobles, known as the "compromise of Breda," against the measures of Philip II. of Spain in the Netherlands, was presented and rejected. During the subsequent centuries, it was the scene of much conflict and diplomatizing until 1813, when the French were finally driven out.

BREDA, DECLARATION OF, the manifesto of Charles II. sent from Breda (1660) previous to his restoration and designed to remove the apprehension felt by many as to the consequences of his accession to the throne. Among its provisions was a free and general pardon to all his subjects, saving only such as should be excepted by parliament. It further promised a settlement of forfeited estates, liquidation of arrears to the army, and that no man should be disturbed for religious opinions not prejudicial to the peace of the kingdom.

BREDA, JAN VAN, 1683-1750; a Dutch painter. He imitated Wouvermans and Breughel so cleverly that connoisseurs are often unable to detect the copy.

BREDERODE, HENDRIK VAN, Count, 1531-68; one of the sovereign counts of Holland, and a leader against Spanish domination in that country. He was for many years turbulent, active, and a source of annoyance about as much to his own party as to the other. After the complete success of the Spaniards he asked Egmont to intercede for him with the regent; his followers were dispersed, some were put to death, and he himself died in a few months.

BREDOW, GABRIEL GOTTFRIED, 1773-1814; a German historian and professor in the university of Breslau. English readers know his *Manual of Ancient History; Researches on History, Geography, and Chronology*, and *Historical Fables*.

BRÉE, MATTHEUS IGNAZIUS VAN, an excellent Flemish painter, b. at Antwerp 22d Feb., 1773, and educated partly there, and partly under Vincent in Paris. As early as 1798, he attracted attention by his "Death of Cato," and several other excellent pictures soon followed. A peculiar talent for rapid and vivid sketching enabled B. to execute for Napoleon, in a few hours, "The Maneuvering of the Fleet before Antwerp on the Scheldt," and, with equal celerity, Napoleon's "Entrance into Amsterdam, at the Moment when the Magistrate presents him with the Keys of the City." In 1816, he painted the famous Leyden burgomaster, Van der Werf, in the act of addressing the famished and murmuring populace during the siege of 1576: "Take my body, and share it among you." This great work—now in the town-house of Leyden—is marked by a felicitous arrangement of the figures, and by a bold and lively coloring, after the style of Rubens. Other celebrated pictures of B.'s are: "Count Egmont receiving Spiritual Consolation before his Execution," "Rubens dictating his Dying Testament," "The Tomb of Nero at Rome, with a Group of Lazzaroni and Musicians." B. died 15th Dec., 1839. In the latter part of his life, he was director of the academy of fine arts at Antwerp.

BREE, PHILIPP JACOB VAN, brother of the preceding, 1786-1840, also acquired some reputation as an historical painter. The Belgian government bought his "Interior of St. Peter's, Rome," and gave him a gold medal.

BREECH, of a gun, is the end furthest from the muzzle. For details, see **BREECH-LOADING ARMS**; **MACHINE GUNS**; **ORDNANCE**; **ORDNANCE FABRICATION**; **RAPID-FIRE GUNS**; **REVOLVER**.

BREECHES BIBLE. See **BIBLE**.

BREECHING, of a naval gun or carronade, is a strong rope by which the recoil of the gun is checked at such a point that the muzzle is brought wholly within the port-hole, where the seamen can sponge and reload it.

BREECH-LOADING, in artillery, relates to a mode of constructing large pieces of ordnance, and small-arms or hand-firearms, the peculiar manner of charging which the term describes. This subject will be found fully treated in the article **ORDNANCE**.

BREECH-LOADING ARMS have been tried, accepted and abandoned without number during the last three centuries, although it is only within the last forty years that the system has been carried out with success. The extraordinary efficacy of breech-loading arms was brought prominently forward during the wars of the past few years, and notably in the Prussian campaigns against Denmark in 1864, and against Austria in 1866. Breech-loading guns began to appear in the first half of the 16th century, and were probably either of French or German origin. During the War of Independence a breech-loading rifle invented by Major Patrick Fergusson, and known as the Fergusson rifle, was used, and it was the first breech-loading carbine used in the British regular army. The introduction of this type of weapon into this country dates properly from 1865, after which muzzle-loading arms were no longer manufactured at the Springfield armory. A short time before the civil war the government tested a number of breech-loading guns, such as the Burnside, Cosmopolitan, Gallagher, Joslyn, Merrill,

Maynard, Smith, Linder, and Sharp. During the war the Spencer rifle was much used by the U. S. Cavalry ; it has a magazine in the butt of the stock holding 7 cartridges. The well known Remington is a single breech-loader, and was adopted by the U. S. navy, Egypt, Spain, and several other countries. Army boards composed of U. S. army officers have repeatedly declared in favor of the Springfield single-loader, and in spite of everything to the contrary, that arm is still in use in our army, although a board in 1892 recommended the adoption of a modification of the Krag-Jørgensen type of rifle. Although the idea of and desire for breech-loading is a very old one it was never satisfactorily applied in small arms till metallic-cased ammunition came into use, because the making of the breech sufficiently gas-tight was difficult before there were cartridge-cases to act as gas-checks. The Chassepot and the far-famed needle-gun, with those above mentioned, did good service, but good breech-loaders did not exist before gas-checking cartridge cases. The metallic-cased, self-primed, gas-checking cartridge of to-day should properly be credited to Napoleon I. He encouraged and aided an artillery officer named Pauly to experiment, till, in 1812, a cartridge was produced having nearly all the essential features of the modern one. For almost a quarter of a century the hammer and anvil have been busy throughout the civilized world in making the weapons of death more deadly. Each nation has, as a rule, elaborated a system from among its own inventors, or if another system has been adopted, it has been subjected to various changes and modifications and stamped more or less with the individuality of the nation adopting it. Nations possessing no great reserve of arms have prepared an entirely new armament ; but those having well stocked arsenals were for years content with altering the old types into breech-loaders. The weapons that have passed out of use will barely be mentioned in the following descriptions, which will be confined to what has taken place within the past five or six years. The development has been so rapid, and so many systems have been in use for a short while and then abandoned, that an extended description of them can hardly be considered necessary.

The question of calibre, which is one of the unsettled questions of the day, although all are agreed upon a reduction below the U. S. standard of .45, was prominently brought forward by Professor Hebler, a German artillery scientist, in 1886, in which he explains the advantages of his system of rifling and those of the smallest practicable calibre. He claims a much flatter trajectory and thereby a much longer shot-swept space, less recoil, lighter ammunition, greater accuracy, greater penetration, less deviation by lateral effect of the wind, and that the wound produced is sufficient to cripple, while much more humane. He scientifically considers all features of rifling, twist, depth, and breadth of grooves and lands, the ammunition and the pressure of gases, and demonstrates, both mathematically and experimentally, that the most efficient rifle is one having a calibre of 7.53 millimetres, a uniform twist of one turn in $15\frac{1}{4}$ calibres, and 6 grooves and lands concentric with the axis of the bore. The Hebler cartridge consists of a bullet made of lead and a compressed gunpowder cartridge. The reduction of the recoil is also proved to be less than with the Mauser, Gras, and Martini-Henry systems. Some of the special features of this system are apparent in all of the more modern patterns that have appeared since it was made public. The *Mannlicher* of the type used by Austria was originally designed to use cartridges of black powder, the charges of which are greater in bulk than corresponding charges of smokeless powder. In order to use the latter, the entire piece would have to be altered ; but to avoid the great expense of so doing, the Austrian military authorities have decided to retain the same size of cartridge-case by adding to the charge of smokeless powder a sufficient quantity of some neutral material to bring up its bulk to that of the black powder charge. A necessary change will be that of the sights, which must be graduated for the new powder. The increase of the pressure along the bore when using smokeless powder will necessitate stronger barrels than are now used in this gun, as many of them have burst from the effects of the higher pressure. The *MANNLICHER* type of arms has been adopted by Austria, Chili, and Bulgaria—Germany has also received it with modifications that will be explained later on. It is a bolt gun weighing 9.68 pounds, has a calibre of .315 inch, 4 trough-shaped grooves .0078 inch deep and .138 inch wide. The sight is graduated to 2,700 yards. The barrel is of Bessemer steel, bronzed externally. The bolt-handle draws to the rear until the cock-notch passes the trigger-catch, which movement withdraws the firing pin, compresses the firing spring, and carries the brace-quin to the rear. A projection on the brace slides up an incline in the brace-quin raising the brace until it is clear of the recoil-shoulder, and freeing the bolt for withdrawal as far as the stop will permit. The stop which limits the withdrawal of the bolt is located on the left of the casing, and retains the bolt of the locking spring. A projection on the stop extends through the receiver and engages in the bolt. The extractor is pivoted near the middle of the bolt. The fore end is shaped like a claw, which takes over the cartridge-rim ; the rear end carries a projection which fits into a recess in the brace-quin. As the brace-quin is drawn to the rear this projection passes out of its recess, and thereby forces the claw at the fore end to grip the cartridge-rim. On shoving the bolt to the front the cock-notch remains in rear of the trigger-catch, while the brace-quin, continuing its movement, forces the brace-quin down into place against the recoil-shoulder, and the projection at the rear end of the extractor, resuming its socket in the brace-quin, locks this latter against accidental dislocation. The piece, being cocked and ready for dis-

charge, may be locked by means of a locking-bolt, which is operated by means of a locking-sector on the left of the breech. In the locking position, the locking-bolt projects in front of the cock-notch, which would be prevented from moving to the front if accidentally released by the trigger. The magazine-pocket is a light steel frame, containing five rounds, arranged horizontally, with their base-rims lying in the vertical groove at the rear end of the packet. The packet is dropped from above into the magazine, where it is held between the packet-catch and the *carrière*-plate which bears only against the bottom round. The *carrière*-plate moves up between the sides of the packet as the rounds are expended, and when the last has been fed, its upward pressure on the packet will cease, and the packet will be ejected downward by the action of the packet-catch. The bullet weighs 243 grains; its core is lead, hardened with 5 per cent. of antimony and pressed into a steel envelope .131 inch thick. Experiments are in progress with material composed of 80 parts of copper and 20 parts of nickel. This will cost much more than the steel envelope, but will not corrode and will not strip the rifling, which is thought to be the reason for the projected change. The powder charge weighed 61.7 grains (the exact weight of the newer powder will not be known until further experiments have been made). Each magazine-pocket contains five rounds weighing 385 grains, and twenty packets are supplied each man, making the weight of ammunition carried per man 7.08 pounds. In competitions in Belgium with the Mannlicher, Nagant, Peiper, and Schulof rifles, the Mannlicher proved itself an excellent weapon, being durable and simple, and easily defeated its competitors. Twenty shots per minute were easily fired, and the magazine-pocket, containing five rounds, required but a very short time to adjust.

Germany, in 1886, re-armed her infantry with a rifle, calibre .43, converted from the *Mausser* breech-loading rifle that succeeded the needle-gun and had been in use since 1871. The barrel is made of mild cast steel, cylindrical, slightly diminishing in thickness at the muzzle, and had an octagonal shape in rear of the rear sight, while that portion forward of the rear sight is smooth and round. The muzzle-sight is a hardened steel knife-edge, sloping toward the muzzle, and is pushed into the notch of the sight-mass sideways. The rear sight consists of two hinged sight-bars secured to the sight-mass by a movable pin, the small bar in rear and long bar in front. Both bars are brought into vertical position for use by pressure of the finger, the small bar being held in position by a special spring in the right eyelet, and the long bar by a special spring set in the foot of the sight. When the long bar is down the standing sight is in position and it is used for distances less than 270 metres. The small bar serves for 350 metres; the long bar for distances of 400 to 1000 metres. The sights are kept dark-dull to avoid any errors in the aim by deceptive sight. The rear end of the barrel is closed by the breech-bolt. The bore is divided into two parts, the rifled portion and the cartridge chamber. The rifling consists of four grooves and four lands of equal breadth. The twist is from left to right, and makes one turn in 50 calibres. The lands are beveled, sloping toward the chamber, to permit the cartridges to take the rifling with facility. The chamber is in the octagonal part of the barrel; its walls are smooth and very strong. When empty it weighs 4.6 kilograms; when loaded, 5 kilograms (11 pounds). The firing-pin is screwed into the breech-plug and goes through the bolt with its forward pointed end projecting through the bolt head-piece. The spiral firing-pin is coiled around the pin in the bolt proper. The bolt's guide-vail has a shoulder which fits into the abutment in the case and prevents the bolt from falling out of the case when drawn back and open. By loosening the screw the bolt may be drawn over. The breech is closed by the head-piece of the bolt, which is free to revolve in the recess in the front end of the bolt; it is bored to admit the firing-pin. The safety-piece prevents the gun from being fired accidentally. This fits into the guide-vail of the breech-plug and is free to revolve, when turned to the right it engages a notch in the plug, so that the breech-plug cannot fly forward even if the trigger be pulled. The extractor fits on the head-piece and has a claw by which it draws the empty cartridge-case out of the chamber as the bolt moves to the rear. The repeater loading mechanism consists of the cartridge magazine, the pawl with double spring, the spoon or *carrière*, and the cut-off. The magazine is a tube of thin sheet steel placed in a hole bored in the wooden stock. Its rear end opens into the case and its front end has a cover to which a stick is attached to enable arms to be stacked. It contains 8 cartridges and a spiral spring with a disc on the rear end; the spring presses the cartridges toward the opening into the case. The pawl prevents the admission of a second cartridge, or of the disc on the end of the spring, into the spoon. The pawl is secured to the left side of the bottom of the case and projects with its claw through to the opening of the magazine tube. The spoon or carrier is a hinged block with a hollow surface to fit the cartridges; it is secured to the case so that its front end may rise and fall. The cut-off or regulating mechanism serves to adjust the gun for a repeater or single loader. The Mannlicher that has been adopted for use in Germany has no wooden guard for the hand; but instead, the barrel is enveloped in a metallic case which absorbs heat very slowly and forms a protection, not only to the hand, but also to the barrel, preserving the latter from the wear and tear of rough usage in service. The sights are secured to this envelope. The front sight is a knife-edge set vertically in a sight-mass. The rear sight consists of a hinged flap and a sliding bar, and is graduated to 2,050 metres. In aiming,

the bottom of the notch in the sliding-bar is intended to be brought in line with the knife-edge of the front sight. The magazine-box is fixed. The magazine charger is a light tin frame containing five rimless cartridges lying one above another, with a groove—which is cut in near the base of each—taking in vertical projections at the rear end of the charger, and with the horizontal edges of the charger curved in to hold the cartridges in place. The charger is introduced and pushed down from above until a projection on its rear face takes under a catch. As the cartridges are discharged a carrier plate moves up between the sides of the charger until the last cartridge enters the chamber, when the empty charger, having nothing to sustain it, drops down and out. To lock the piece, a small vertical lip on top of the rear of the bolt is moved to the right, to a horizontal position, when, even though the trigger be pulled, the firing-pin cannot touch the cartridge. The bullet is of lead encased in German silver. Each soldier carries two cartridge-boxes in front containing 12 charges of 5 cartridges each, and one cartridge-box behind, containing 18 charges of 5 cartridges each, a total of 150 cartridges, which, with their accompanying chargers, weigh $10\frac{1}{2}$ pounds. The calibre is .311 inch; length without bayonet, 4.08 feet; weight without bayonet, 8.38 lbs.; weight of charge, 38.6 grains; weight of bullet, 223.7 grains. Number of grooves, 4; length, 28.35 inches; twist, one turn in 9.45 inches. Average rate of fire per minute, 18; penetration in dry fir wood at 1 mile, 2 inches.

The SCHMIDT magazine rifle has been officially adopted in Switzerland. Its calibre is .295 inch; weight of smokeless powder charge, 40.3 grains; weight of bullet, 221.3 grains; muzzle velocity, 2,362 feet per second; estimated rate of fire, 30 shots per minute. It is a bolt-gun in which a to-and-fro movement of the bolt suffices to extract the empty cartridge-case, introduce a new cartridge from the magazine, and make ready for use, in consequence of which the soldier is enabled to fire continuously without removing the piece from his shoulder so long as there are cartridges in the magazine. By means of a cut-off the gun can be used either as a magazine-arm or as a single loader. The magazine is fixed, and differs from the Mannlicher type in being closed at the bottom. It is fitted to contain 12 cartridges placed to partly ride each other, and is filled from the top, being so arranged that it can either be fully charged at once or have its cartridges entered one by one. The bullet is of lead, enclosed in an envelope of nickel-steel. A wooden guard is fitted to the barrel between the sights, and the gun is sighted up to 2,624 yards. Each soldier using this arm is to carry 8 chargers of 6 cartridges each in a box; 16 chargers of 6 cartridges each in a haversack, and 20 loose cartridges in a pouch—a total of 164 cartridges.

Denmark has adopted the KRAG-JÖRGENSEN rifle, of .315 calibre; the magazine is a horizontal fixed box under the breech-casing which curves up to the cartridge opening on the left side of the gun. This magazine is constructed to contain five cartridges, which are to be loaded into it from tin chargers. A cut-off in the rear of the magazine permits the use of the gun as a single loader. The barrel is encased in a metal envelope very similar to that of the new German rifle. The gun weighs 9.4 pounds, has 6 grooves, and a twist of one turn in 11.8 inches.

France has replaced the Gras by the LEBEL rifle, which is composed of six principal parts, namely, the barrel, bolt, repeating mechanism, stock in two pieces, fittings and sword bayonet. The barrel has two parts, the barrel proper and the receiver. The barrel, of tempered steel, is bronzed exteriorly. There are four grooves, turning from right to left. Each land is half the groove-width. The receiver which screws on the rear end of the barrel contains in its upper part the lodgment for the bolt, and in its lower part the lodgment for the repeating mechanism. The bolt consists of eight pieces and the repeating mechanism of six. The fore-arm contains the magazine, with a capacity for eight cartridges arranged longitudinally. Length of rifle without bayonet, 51.4 inches; calibre, min. .314; max. .323; depth of grooves, .0059 inch; weight without bayonet, and magazine empty, 9.196 pounds; weight of eight cartridges, .517 pound. Sighted for 2187 yds. The bullet is hardened lead coated with nickel, length 1.181 in. weight 231.5 grains; at 220 yards can pierce 15 inches of oak. The powder is a compound of gun-cotton and collodion producing little smoke and noise and a very slight recoil. On raising the bolt-lever the spiral side of the cocking-groove acts on the spiral side of the quoin and tends to turn the cocking-piece, which takes a retrograde movement. When the bolt-lever is vertical the front face of the cocking-piece has passed the sear and the piece is cocked. The bolt is now pulled to the rear until the lower tenon of the movable head fetches up against the projection on the carrier-lever. The cartridge-case is drawn to the rear; its left side takes against the screw-ejector; its right side is held by the claw of the extractor, consequently it pivots about the screw-ejector, and is projected out of the receiver. On shoving the bolt to the front the cartridge is pushed into the chamber by the movable head and the extractor. The bolt-lever is now turned down to the right. The tail of the carrier-lever, owing to the pressure of the lower reinforce of the cylinder, descends, lowering the carrier. The heel of the carrier bears on the long arm of the cartridge-retention lever, and consequently raises the short arm and the lip. The second cartridge, being no longer withheld by the beak of the carrier, shoots into the carrier under the pressure of the magazine spring, and the rim of the third cartridge is intercepted by the lip of the retention lever. The Lebel bullet passes through the bone when it strikes full, and produces fracture only when the impact is tangential.

The CARCANO magazine rifle is supplied to the army in Italy. It has a bore of .256 inch and carries a magazine containing 6 rounds. Its length is 50.7 inches; weight, 8.4 pounds; weight of cartridge, 188 grains. The bullet is of lead with a covering of copper, and it has a muzzle velocity of 2,320 ft. per second. The Snider and Martini-Henry rifles in England have finally given way to a combination of the Lee and Männlicher, having .303 calibre. The magazine is a sheet-steel box which is inserted through an opening in the body from underneath in front of the trigger-guard, and held in place by a spring engaging in a notch in the magazine. It is secured to the gun by a few links of steel chain. A cut-off is fitted to the right side of the body, which, when pressed in, cuts off the further supply of cartridges from the magazine, and permits the gun to be used as a single-loader. The magazine can be freed from the gun by pressing a lever inside the trigger-guard. The cartridges, eight in number, are packed in the magazine, half riding one another, and rest on a movable platform which is pressed up by a spring which feeds the cartridges to the chamber. The breech action is on the bolt system, and the cocking piece is so arranged that the gun can be carried at half-cock. A solid rib of steel takes the recoil on the right of the bolt and a solid steel lug on the left. The firing-pin and its spring are in the heart of the bolt, which, when forced home, holds back the pin and compresses the spring. If the bolt is not pushed close home the pulling of the trigger will completely close it before firing. A safety catch on the left side, if pulled back when the piece is at full cock, locks the mechanism. There is a gas-escape on each side of the breech and one in the bolt-head. Removable covers are fitted to the bolt and bolt-head, and a wooden hand-guard is fitted over the rear end of the barrel to protect the hand when the barrel gets heated. Two sets of sights are furnished, one for ordinary sighting, graduated to 1900 yards, and the other for long distance, up to 3500 yards. For ranges up to 1900 yards the fore sight is a rectangular block with a narrow slit down the middle. The rear sight is a hinged flap with a sliding-bar having its upper edge beveled with a square notch cut in the middle, from the centre of which a fine white line runs vertically downward. For long distance sighting both sights are on the left of the gun. The rear sight is simply a disc containing a circular aperture. The front sight is a dial graduated from 1800 to 3500 yards and has a revolving index hand which, when set at the distance required, is brought in line with the aperture of the rear sight. Length of piece, 49.5 inches; weight complete, 9.13 pounds; weight of bullet, 215 grains; charge of powder, 65 grains; number of grooves, 7. The bullet is of lead, encased in a nickel or steel envelope.

No important change since 1895 has been made by any of the powers in the small arms of their troops. Rifles of small caliber have now been adopted all over the world. The U. S. army has been entirely supplied with the new Krag-Jørgenson gun of .30 caliber, and the navy with Lee rifles of .236 caliber. The following table gives the rifles of the principal countries of the world.

COUNTRY.	Name of Gun.	Calibre.	Length, without Bayonet.		Length, with Bayonet.		Weight, without Bayonet.		Weight, with Bayonet.		No. of Car- ges in Magazine.	Gun Sighted to —	Covering or Jacket of Cartridge.	Weight of Whole Cartridge.	Muzzle Ve- locity, Ft., Seconds.

BREED, in domestic animals, a variety or often merely a race distinguished by the possession of particular qualities, but not differing from the ordinary type of the species so as to constitute what naturalists usually designate a variety. The peculiarities of breeds in animals find an exact counterpart in cultivated plants, the value of particular kinds often depending, in a great measure, upon characters scarcely capable of being defined in the language of scientific description, but to the production and perpetuation of which

the attention of the cultivator cannot be too earnestly directed. These, also, in plants, as in animals, have of themselves little permanence, and the preservation or perpetuation of them depends upon the same assiduous attention and high cultivation from which, more frequently than from any mere accidental circumstances, they have originated. Thus it happens that the most improved varieties of garden-plants usually degenerate even under ordinary horticultural treatment, and the choice pansies of the florist lose their characteristic excellences if a place is simply assigned to them in a common flower-border. The improvements which cultivation has effected in the productions of the fruit, flower, and kitchen garden do not, however, possess an economic importance to be compared to that of the similar improvements in the cereals and other plants cultivated on the most extensive scale, or in the breeds of some of the most valuable domestic animals. To the breeding of these, great attention has of late been paid—probably more since the beginning of the 19th c. than in all the previous history of the world—and with results the magnitude of which may in some measure be estimated from the statement made on very competent authority, that within the last thirty years the weight of mutton produced has been about doubled in proportion to the number of sheep kept. To the improvement of the B. of horses, attention has been paid for a much longer time than to that of oxen and sheep; and to this must, in a great measure, be ascribed the different excellences of some of the well-known breeds employed for very different purposes. The use of the horse in war, and for purposes of pomp and luxury, appears to have been the reason of the higher degree of attention thus paid to it, even from ancient times. The Arabs have long been particularly careful of the B. of their horses, and diligently preserve a record of their pedigree. What is called *blood* in horses, however, only fits them in a higher degree for certain purposes; and with regard to this as to other animals, the judgment of the breeder must be exercised, as the perpetuation, increase, or combination of particular qualities may be the object which he has in view. Fleetness and strength are important qualities in horses, the extremes of which never co-exist in the same animal, but of which a certain combination is for some purposes very desirable; and either of these may be displayed in a great degree without much *bottom*, or power of enduring continued severe exertion—a quality of very high value. The properties most desired in sheep and oxen are very different from those most highly esteemed in the horse—the fleece and the flesh being chiefly regarded in sheep, the flesh and the milk in oxen. Sometimes a perpetuation of good qualities is the great object of the breeder, and a combination of them in the highest possible degree is aimed at; sometimes, the production of the largest possible quantity of beef or mutton in the shortest time being almost exclusively designed, the breeder neglects considerations which would be of importance if his stock could not be improved by animals obtained from other quarters. Extraordinary differences are certainly found to exist among animals of the same species in the readiness with which they convert food into flesh and fat, and in the age at which they are fit for the hands of the butcher. One effect of the attention bestowed of late upon the breeding of stock, has been to supply the market, to a great extent, with the flesh of younger animals than could previously be sent to it—a change evidently tending not only to the benefit of the farmer, but to increase national wealth.

Some of the most important breeds of domestic animals will be mentioned under their proper heads. It remains for us only to allude here to the rules and physiological principles of breeding; but the latter, in so far as application of them has yet been found practicable, are only the best known principles of physiology (q.v.). In a great measure, however, the rules which guide the breeding of stock have been learned by experience, and are rather to be regarded as contributions to science than as deductions from it. The probable relative influence of the male and female parent upon their progeny, is a point unquestionably of the greatest importance, but concerning which widely different opinions have been maintained; and another much controverted and important point is, the propriety of *breeding in and in*. Practically, the rule is always observed, by those who seek the improvement of a *breed*, of selecting the very finest animals possible, both male and female; although a great improvement of the existing stock on a farm is often effected in the most advantageous manner by the mere introduction of males of better quality. The dangers of *breeding in and in* are very generally acknowledged, even whilst it is contended that they may very much be obviated by careful rejection of every faulty animal, and that in this way the utmost advantage may be taken of the very highest improvements; but it is likewise very generally admitted that, if equally improved individuals can be obtained not so nearly related, it is better to seek the perpetuation of the B. by their means. It is a rule also of much practical importance, that an improvement of B. is to be attained not by a *cross* between animals of very different breeds, as between a dray-horse and a race-horse, but only between those which are comparatively similar. The result of the intermixture of very dissimilar breeds is never in any respect satisfactory.

BREDEE, a river in Cape Colony, flowing chiefly through the district of Zwellingdam, which contains cape Agulhas, the most southerly point of Africa. It rises in the Warm-Bokkeveld, a mountain-basin about lat. 33° 10' s., and long. 19° 30' e., running first to the w., and afterwards to the s.e.; and it enters St. Sebastian's Bay or Port Beaufort, from which, upwards, it is navigable to a distance of 40 miles. Its exports are wool, aloes, skins, feathers, grain, butter, cattle, mules, etc.

BREESE, SYDNEY, born in New York in 1800, removed to Ill., 1821. He held important legal offices in Ill., and published a vol. of Supreme court reports, 1829. He served as lieut. col. of vols. in the Black Hawk war; was elected to the Supreme court, 1841; U. S. senator, 1843-49. He was one of the originators of the Ill. Central railroad. After years of service as speaker of the Ill. house of representatives, and in the circuit judgeship, he was elected justice of the Supreme court, holding the office till his death in 1878—being for several terms chief justice.

BREEZE. See WIND.

BREGENZ, a frontier t. of Austria, capital of the district of Vorarlberg, is situated at the mouth of the small river Bregenz, which here flows into the lake of Constance, between the Swiss and Bavarian territories, about 80 m. w.n.w. of Innsprück. From the ruins of the castle of Hohenbregenz, on a hill near the town, a very beautiful prospect is obtained of the lake and its surrounding vineyards, etc. B. is one of the oldest towns, and was formerly one of the chief fortified places in the southern part of Germany. The inhabitants (1890), 6739 in number, are engaged in agriculture, horticulture, and cattle-keeping. Cotton-spinning and weaving are also carried on.

BREGUET, ABRAHAM LOUIS, 1747-1823; a Swiss mechanician and watchmaker, and a native of Neuchâtel. The astronomical and nautical instruments invented by him were noted for the perfection of their workmanship, and his improvements in watches were of decided value, and included the use of rubies in pivot holes. He was made a member of the Academy of Sciences at Paris, and of the French Bureau of Longitude. A grandson, LOUIS, 1808-83, also a watchmaker, published in 1845 a treatise on the electric telegraph.

BREHON LAWS (in Irish, *dlighidh breitheamhuin*—that is, "judges' laws"), the name usually given to the system of jurisprudence which prevailed among the native Irish from an early period till towards the middle of the 17th century. The *breitheamhuin* (pronounced *brei-hoo-in*, or *brehon*), from whom the laws had their name, were hereditary judges, who administered justice among the members of their tribe, seated in the open air, upon a few sods, on a hill or rising ground. The poet Spenser, in his *View of the State of Ireland*, written in 1596, describes the B. L. as "a rule of right unwritten, but delivered by tradition from one to another, in which oftentimes there appeareth great share of equity, in determining the right between party and party, but in many things repugning quite both to God's law and man's: as, for example, in the case of murder, the brehon—that is, their judge—will compound between the murderer and the friends of the party murdered, which prosecute the action, that the malefactor shall give unto them, or to the child or wife of him that is slain, a recompense, which they call an *eric*; by which vile law of theirs many murders amongst them are made up and smothered: and this judge being, as he is called, the lord's brehon, adjudgeth for the most part a better share unto his lord, that is, the lord of the soil, or head of the sept, and also, unto himself for his judgment, a greater portion than unto the plaintiffs or parties grieved." Spenser was ignorant that pecuniary compensation for manslaughter had obtained in the ancient laws, as well of England as of most European nations. He was mistaken, too, in believing that the B. L. was an unwritten code. Many manuscript collections of the B. L. still exist in public and private libraries in Ireland, England, and Belgium. These manuscripts are regarded as varying in date from the early part of the 14th to the close of the 16th century. For the laws themselves, a much higher antiquity is claimed. On this point, we must be content to quote what has been said on the part of the very few persons who have had an opportunity of making themselves acquainted with the existing collections of the brehon laws. "So far as we have external evidence to guide us," say Dr. J. H. Todd and Dr. C. Graves, two eminent Irish antiquaries, "there is no reason to suspect that the brehon laws have undergone any material change since the time of Cormac Mac Cuilleannain, king and bishop of Cashel, who died 908 A.D. He was a man of great learning and energy, who certainly promoted the execution of considerable literary works, and under whose influence it is not improbable that a systematic compilation of the laws may have been effected. Of this, however, we have no distinct record. On the other hand, we find scattered through all parts of the laws allusions to a general revision of them made in the 5th c., at the instance of St. Patrick, who, in conjunction with certain kings and learned men, is said to have expunged from them all those institutions which savored of paganism, and to have framed the code called the Seanchus Mor. These same documents assert the existence of still more ancient written laws, the greater part of which are ascribed to Cormac Mac Art, monarch of Ireland, in the middle of the 3d century. However slow we may be to acquiesce in statements of this kind, which contradict what we have learned concerning the progress of legislation in the remaining parts of western Europe, we may readily admit that the subject matter of many of the laws demonstrates their great antiquity, as it indicates the primitive nature of the society in which they prevailed. In spite of the attempts to efface it, traces of heathenism are still discernible in many parts of them.

BREISACH, ALT, a very old t. of the grand duchy of Baden, situated on an isolated basalt hill on the right side of the Rhine, about 12 m. w. of Freiburg. As early as the time of Julius Cæsar, *Mons Brisacius* was known as a strong military position, and was

taken by Ariovistus when he invaded Gaul. Being regarded as the key to the w. of Germany, it was a prominent scene of action during the thirty years' war, at the conclusion of which it was ceded to the French. During the next century, it frequently changed masters, now belonging to France, and now to Austria. The French destroyed its fortifications in 1744, and during the war of the revolution in 1793, part of the town was burned by them. In 1806, the French handed it over to the house of Baden. The minister of St. Stephen is a venerable structure in good preservation, and contains several old monuments. Pop. '90, about 4000.

BREISGAU, a German district which in the middle ages extended along the right bank of the Rhine, from the episcopal territory of Strasbourg to Basel, embracing Freiburg and the southern Black Forest. Since 1810 it has been part of Baden.

BREISLAK, SCIPIONE, 1748-1826; b. in Rome; geologist. He was professor in the Collegio Nazareno, in Rome, and devoted his leisure to geological researches in the papal states. The king of Naples appointed him professor of mineralogy to the royal artillery, and under his direction the sulphur refining works in the district of Solfatara were erected. In 1798 he published his *Physical Topography of the Campagna*, and followed with various works on similar topics.

BREITENFELD, a village and manor of Saxony, about 5 m. n. of Leipsic. It is historically remarkable for three battles, fought on a plain in its neighborhood. The first of these, between the Swedes and the Imperialists, which was fought on the 7th Sept., 1631, was of the highest importance to Europe, as it secured the permanency of Protestantism and the freedom of Germany. Tilly's pride had reached its highest point after the fall of Magdeburg, which took place on the 10th of May, 1631; and in the early part of Sept. of the same year, he advanced against the Saxons, with an army of about 40,000 men, for the purpose of forcing the elector, John George I. (who would not submit to the edict of restitution, and was treating with the Swedish king, Gustavus Adolphus), into an alliance with the emperor. No other way remained than for the elector to join the Swedish king, who had just entered Pomerania. Gustavus Adolphus, joined by the Saxons, advanced towards Leipsic, where Tilly lay, who advanced into the plain of Breitenfeld. The imperial forces were completely defeated, and their three most distinguished generals, Tilly, Pappenheim, and Fürstenberg, wounded. The second battle which B. witnessed again resulted in the triumph of Swedish valor: it took place on the 23d of Oct., 1642, between the Swedes, headed by Torstenson, one of the pupils of Gustavus, who had invested Leipsic, and the archduke Leopold, with Gen. Piccolomini, who were advancing from Dresden to its relief. The Swedes gained a complete victory over the imperialists, who fled into Bohemia, leaving behind them 46 cannon, 121 flags, 69 standards, and the whole of their baggage. The third battle of which B. was the scene, was fought on the 16th of Oct., 1813, and was part of the great contest known as the battle of Leipsic.

BREITMANN, HANS. See LELAND, CHARLES GODFREY.

BRE'MEN, a state and free city of Germany, is situated on the Weser, about 50 m. from its mouth. Pop. '95, 196,404, nearly all Protestants. B. is divided into the old and the new town—the former on the right, the latter on the left side of the river, which is spanned by four bridges. The ramparts and bastions round the old town have been leveled, and formed into public promenades, which are laid out with excellent taste. Among the principal buildings, the cathedral (built about 1160), the Gothic town-hall (begun about 1405), with its famous wine-cellar, said to contain hock of the vintage of 1624, the exchange, the museum, the post office, and the observatory of Dr. Olbers, from which he discovered the planets Pallas and Vesta, are remarkable. The position of B. makes it the emporium of Brunswick, Hesse, and other countries through which the Weser flows. Besides its excellent water communication, it is connected by railways with the whole of western and central Germany. B. is an exceedingly thriving place. Large vessels stop at Bremerhaven, where there is a spacious harbor constructed, about 38 m. below B., with which it is connected by electric telegraph. Vessels not drawing more than 7 ft. of water can come up to the town itself. Altogether there are four harbors, including the "Safety," or original harbor. The city leased the entire harbor district to a private corporation. B. carries on an extensive commerce with European countries, the United States of America, the West Indies, Africa, the East Indies, China, and Australia. This commerce has shown a remarkable development since 1847, rising from 197,000,000 marks in that year to 1,276,000,000 in 1891, and it has since increased. With the exception of Hamburg, no continental port ships so many emigrants to the United States as B., through its main port at Bremerhaven. The number of ships belonging to the state in 1895 was 423, with an aggregate burden of 422,205 tons, including 206 steamers with an aggregate burden of 224,296 tons. In 1895, the value of the imports amounted to 806,301,101 marks; exports, 765,852,249, a very great increase as compared with the year 1858, when the imports were valued at \$41,185,000, and the exports at about \$40,000,000. The chief imports are tobacco, coffee, sugar, cotton, rice, skins, dye-woods, wines, timber, hemp, etc. The exports consist of woolen goods, linens, glass, rags, wool, hemp, hides, oil-cake, wooden toys, etc. Large quantities of tobacco are re-exported. B. has manufactures of woolens and cottons, cigars, paper, and starch, and extensive shipbuilding yards, breweries, distilleries, and

sugar refineries. The cigar and sugar manufactures have of late declined, the former on account of the increase of duty. It has steam communication with New York, and Hull, Havana, the n. coast of South America, etc., by vessels of the North German-Lloyd steamship company.

B. first became of historical note in the 8th c., when it was erected into a bishopric by Charlemagne. It soon attained considerable commercial importance, and became one of the principal cities of the Hanseatic league (q.v.). Having frequently suffered at the hands of the French, it was, in 1810, incorporated with that empire; but it recovered its independence in 1813, and by the congress of Vienna was admitted, in 1815, as one of the Hanse towns, into the Germanic confederation. In 1867, it became a member of the North German confederation, and now it forms part of the German empire. In 1884 it agreed to a surrender of its privileges as a free port, which took effect Oct. 1, 1886, but certain new docks and warehouses (the *Freihafen Gebiet*), as well as the Bremerhaven docks, are excepted from this arrangement. The area of its territory is about 100 sq. m. The government is intrusted to a senate of 16 members, two of whom are chosen burgo-masters, and to a municipal council of 150 burgesses.

BREMERHAVEN, a port on the Weser, about 10 m. from its mouth, was founded by Bremen in 1827, on ground acquired from Hanover.

BREMER, a co. in n.e. Iowa, on Cedar river; 432 sq. m.; pop. '70, 14,528; '90, 14,630; good soil, well watered and timbered; traversed by the Illinois Central, the Burlington, Cedar Rapids, and Northern, and the Chicago and Great Western railroads. Agricultural productions. Co. seat, Waverly.

BREMER, FREDRIKA, a Swedish novelist, was b. in Tuorla, near Abo, in Finland, 17th Aug., 1801; but when she was only three years old, her father removed to Sweden. As a child of eight, she had already begun to write verses; and the works of German poets, Schiller more especially, exercised a most powerful influence over her youthful imagination. Her original novels first made their appearance under the general title *Tekningar ur Hvardagstifvet*, at Stockholm, in 1835. It was not, however, till 1842 that the English public hailed with delight the appearance, in an English dress, of *The Neighbors*, perhaps the most universally popular of all Fredrika B.'s charming pictures of domestic life in Sweden. Encouraged by its enthusiastic reception, Mrs. Howitt subsequently published translations of *The Diary*, *The H. Family*, *The President's Daughters*, *Brothers and Sisters*, *Life in Dalecarlia*, and *The Midnight Sun*. In 1849, Miss B. visited the United States, and there spent two years, passing some time in England on her return. In her *Homes of the New World*, published simultaneously in England, America, and Sweden, in 1853, she not only presents us with exquisite descriptions of scenery, and vivid pictures of social life, but with sound and comprehensive views on political and moral subjects. Returning to her home in Sweden, to find a beloved sister dead, Miss B. devoted her talents and energies to the carrying out of certain philanthropic objects, in which she had throughout life felt deep interest, more especially the education of the poorest classes. As a writer of fiction, she was distinguished for feminine delicacy, shrewd sense, humor, deep knowledge of human nature, and a graphic and forcible style. Her works have been translated into almost all the languages of Europe. She died in 1865. Her life and unpublished writings were issued by her sister Charlotte in 1868.

BRENDAN, or BRANDANUS, the legendary hero of great ocean voyages made under the protection of angels; revered in Ireland as a saint, where, and in England, he is supposed to have founded religious establishments. His death is set down in 578 A.D.

BRENHAM, city and co. seat of Washington co., Tex., on the Gulf, Colorado, and Santa Fé, and the Houston and Texas Central railroads, 72 m. w.n.w. of Houston. It is in an agricultural and cotton-raising region, and has a national bank, Blinn Memorial College, high school, daily and weekly newspapers, electric lights, cotton compresses, cotton-seed oil mill, foundries, etc. Pop. '90, 5209; '96, about 8000.

BRENNER PASS, a pass in the main chain of the Alps, on the road between Innsbruck (q.v.) on the n. and Botzen (q.v.) on the s., connecting the s. of Germany with Venice and the n.e. of Italy. The B. P. is the lowest which crosses the main chain of the Alps, the summit being only 4775 feet above the level of the sea. Lofty mountains rise above it to the further height of more than 7500 ft., yet the scenery of the pass is less sublime and interesting than that of any other of the great passes of the Alps. It is open at all seasons of the year. At the summit of the pass is the village of Brenner, a resting-place for travelers, with a pop. of about 400. The climate here is so severe that corn seldom ripens. Here the traveler finds in close contiguity the Eisach, a small stream, which, after growing to be a considerable river, joins the Adige and the Sill, a tributary of the Inn; the one stream flowing to the gulf of Venice, and the other into the Black sea. On 18th Aug., 1867, a railway through the B. P. was opened, and thus a complete line of railway communication was established between Germany and Italy; Botzen having already been connected by a railway through the valley of the Adige with Verona, and so with the whole of Italy—Innsbruck being likewise connected with the railway system of Germany. This work was begun by the Austrian government when Venetia belonged to the Austrian empire, and with the view not only of facilitating military operations, but of restoring the commercial prosperity of Venice, by making it the port of southern

Germany. The prosecution of the works, however, was not arrested by the great political changes which took place. A liberal commercial treaty, recently made between Austria and Italy, binds the two countries together in community of interests, restoring, in fact, the natural state of things with which political animosities had long interfered; and it has been made quite apparent, from the activity with which the roads have been repaired on some of the Alpine passes, and particularly that of the Stelvio, that both Germans and Italians appreciate the importance of an intimate commercial intercourse. The distance from Innsbruck to Botzen in a direct line is only 52 m., but by the windings of the road or of the railway, it is much increased.

BRENNUS, the name or rather the title of several Gallic princes, is probably a Latinized form of the Kymric word *brenhin*, which signifies a king. The most famous B. was that leader of the Gauls who, in 390 B.C., crossed the Apennines, and hurrying through the country of the Sabines, at the head of 70,000 men, encountered and overthrew on the banks of the Allia (q.v.) the Roman army. Had the barbarians immediately followed up their advantage, Rome might have been obliterated from the earth; but instead of doing so they abandoned themselves to drunken delights on the battlefield, and gave the Romans time to fortify the capitol, whither were removed all the treasures and holy things of the city. When B. entered the gates he found that all the inhabitants of the city had fled, with the exception of the women and children, and old men, the last of whom, with pathetic heroism, had resolved not to survive the destruction of their homes, and so, the chief among them, clothed in their robes of sacerdotal or consular dignity, and sitting in the curule chairs, waited the approach of their enemies, and received their death in majestic silence. B., having plundered the city, now besieged the capitol for six months. During the beleaguering occurred the famous night-attack, which would have been successful had not the cackling of the geese, kept in Juno's temple, awakened the garrison. At length, however, the Romans were compelled to enter into negotiations with the besiegers. They offered 1000 lbs. of gold for their ransom, which was agreed to. According to Polybius, B. and his Gauls returned home in safety with their booty; but the rather mythical Roman traditions affirm that, just as the Gauls were leaving the city, Camillus, who had been recalled from banishment and appointed dictator, appeared at the head of an army, attacked them, and, in two bloody battles, slew the whole of the barbarians to a man.

Another B., who occupies a conspicuous place in history, was that Gallic chief who invaded Greece, 279 B.C., at the head of 150,000 foot and 61,000 horse. After desolating Macedonia, B. forced his way through Thessaly to Thermopylæ. The Grecian army fled at his approach. B. now rushed on with a division of his great host to Delphi, which he had resolved to plunder; but the Delphians having taken up a very advantageous position on some rocks, resisted his further progress. Assisted by the terrors of an earthquake and a terrible storm, besides, according to reverential tradition, by the supernatural help of Apollo, they utterly routed the Gauls, who fled in dismay. B. was taken prisoner, and drank himself to death in despair.

BRENTA (*Medoacus Major*), a river of n. Italy, rises from two small lakes in the Tyrol; flows first in a southern, then in an eastern course through the Venetian territory; passes the towns Cismona and Bassano; receives an arm of the Bacchiglione below Padua.

BRENTANO, CLEMENS, known as a novelist and dramatic poet, and as the brother of Goethe's "Bettina," was born at Frankfort-on-the-Main, 1778. He studied at Jena, and afterwards resided successively at Frankfort, Heidelberg, Vienna, and Berlin. In 1818, through a morbid discontent with himself and his fellow-men, he retired to the cloister at Dülmen, in Münster. Latterly he resided at Regensburg, Munich, and Frankfort-on-the-Main, where he led the life of a recluse, and gained a considerable reputation on account of his sarcastic wit. He died at Aschaffenburg, on the 28th of June, 1842. In his earliest poems the peculiarities of the "romantic school" of his time are carried to excess. His dramatic productions, such as *The Merry Musicians*, a *Musical Drama* (Frankfort, 1803), in which there are some gems of lyric poetry; *Ponce de Leon* (Göttingen, 1804), etc., are characterized by great dramatic power, amusing though rather far-fetched wit, and a wonderful flow of humor. Perhaps his most successful piece as a drama, is *The Founding of Prague* (Pesth, 1816). B. was most successful in his smaller novels, particularly in the *History of Caspar the Brave and the Fair Annerl* (2d edit. Berlin, 1831), which German critics call a "chef-d'œuvre in miniature." His last work, the legend of *Gökel, Hinkel, and Gakeleia* (Frankfort, 1838), was intended as a satire upon the times in which he lived. He has received the grateful acknowledgment of his countrymen for his renovation of the good old history of George Wickram, of Kolmar, which he published under the title of *The Thread of Gold* (*Der Goldfaden*, Heidelb., 1809).

BRENTANO, LUJO, political economist, b. in Bavaria, 1844, studied at Dublin and several German universities, specializing in the investigation of the condition of the working classes. He belongs to the modern historical school and is classed with the so-called "Socialists of the Chair." His works include treatises on the guilds, on wages, on labor in relation to land, compulsory insurance for working men, the Christian socialist movement in England, etc.

BRENTFORD, the co. t. of Middlesex, on both sides of the Brent, at its confluence with the Thames, 7 m. w.s.w. of London, and where the Thames is crossed by a bridge

leading to Kew. It consists chiefly of one long irregular street. Pop. '91, 13,736. It has extensive manufactories, and there are many market-gardens in the vicinity. Here Ironside defeated the Danes in 1016, after expelling them from London; in 1558, six martyrs were burned at the stake; and in 1642 the royalists, under Rupert, defeated the parliamentarians under col. Hollis. There are frequent allusions to it in English literature.

BRENT GOOSE, or **BRENT BARNACLE**. This bird has been already noticed under **BARNACLE** (q.v.). We add here a few sentences from col. Hawker's *Instructions to Young Sportsmen*, which we borrow from Yarrell's *British Birds*. They refer to wild-fowl shooting on the coasts of Dorsetshire and Hampshire. "Towards Nov. or Dec., we have the Brent geese, which are always wild, unless in very hard weather. In calm weather, these geese have the cunning, in general, to leave the mud as soon as the tide flows high enough to bear an enemy; and then they go off to sea, and feed on the drifting weeds. To kill Brent geese by day, get out of sight in a small punt, at low water, and keep as near as possible to the edge of the sea. You will then hear them coming like a pack of hounds in full cry, and they will repeatedly pass within fair shot, provided you are well concealed, and the weather is windy to make them fly low. Before you fire at them, spring suddenly up, and these awkward birds will be in such a fright as to hover together and present a mark like a barn-door."—The extensive muddy and sandy flats between Holy island and the coast of Northumberland are a great winter resort of this species. It is also particularly abundant on muddy and sandy flats in Cromarty bay. The markets, both of London and Edinburgh, are well supplied with it during winter. The B. G. is known in some parts of England as the black goose; it is considered the most delicate for table of all its tribe, and is perhaps as much sought after as any. The B. G. differs in its habits from the common gray lag and several other species, inasmuch as it never feeds on fresh-water herbage, its tastes being exclusively salinious. B. G. may be distinguished, when on the wing, by their black bodies and white tails. Folkhard, in his excellent work, *The Wild Fowler*, gives much interesting information regarding this bird.

BRENTON, **EDWARD PELHAM**, 1774-1859; a capt. in the British navy. He wrote a *Naval History of Great Britain, from 1783 to 1822*. He was the founder of the Children's Friend Society.

BRENTON, **WILLIAM**, d. Newport, R. I., 1674; an emigrant from England, who held important offices in the colonies of Massachusetts and Rhode Island, being governor of the latter, 1666-69.

BRENZ, **JOHANN**, 1499-1570; a German reformer under Luther; a writer of great ability and popularity. One of his teachings was that the body of the Lord is everywhere present; hence his followers were called "Ubiquitarians."

BRESCIA, or **BRESCIANO**, a province in Lombardy, Italy, separated from Verona by Lago di Garda; 1845 sq. m.; pop. est. '95, 494,310. The n. part is occupied by a chain of the Rhetian Alps; the remainder, about two-thirds of the province, is a part of the great and fertile plain of Lombardy. The rivers are the Oglio, the Mella, and the Chiese, tributaries of the Po. Corn, flax, hemp, grapes, and olives are cultivated. The mountains yield iron, copper, marble, alabaster, and granite. There are manufactures of silk, wool, cotton, linen, iron, steel, copper, glass, and paper. The chief towns are Rovato, Chiara, Orzinovigo, Monte-Chiaro, Salo, and Pontevico.

BRESCIA, a city of Italy, capital of the province of the same name, in Lombardy, about 60 m. e.n.e. of Milan. It is romantically situated on the rivers Mella and Garza, in a wide fertile plain, at the base of several hills. The railway from Milan to Venice passes through Brescia. The city is for the most part regularly built, and, besides two cathedrals, the old and the new, it has numerous ancient churches, adorned with pictures and frescos, including many by masters of the Venetian school. Several interesting antiquities have been discovered. It has a valuable public library, the *Biblioteca Quiriniana*, founded and nobly endowed about 1750, by cardinal Quirini, a munificent encourager of literature. It contains upwards of 30,000 volumes, with many rare manuscripts. The pop. in 1895 was 67,700. B. has manufactures of woolen, silk, leather, paper, etc., and its wine is of good quality. The old name of B. was *Brixia*, and its inhabitants were allied with the Romans when Hannibal crossed the Alps. It was captured by the Huns during their migrations and afterwards passed through the hands of the Lombards, Charlemagne, the Franks, and the Germans. It was taken by the French under Gaston de Foix, in 1512, when it is stated that more than 40,000 of the inhabitants were massacred. The city never fully recovered from the effects of that inhuman sack and pillage. In Mar., 1849, B., as the only important town opposed to Austrian rule in Lombardy, was besieged by Haynau, and forced to capitulate.

BRESLAU, the capital of the province of Silesia, Prussia, is situated at the confluence of the Ohlau and Oder. Its pop. was 207,997 in 1870; and in 1895, 373,206, ranking next to Berlin in the latter year. The Oder divides it into two parts, which are connected by numerous handsome bridges. The fortifications have been converted into beautiful promenades, and the ditch has been transformed into an ornamental sheet of water. The streets of the new portion of B. are spacious and regular, and the houses stately and

handsome, affording a pleasant contrast to the somber, massive structures of the old town. Educational institutions are numerous, including a university founded by the emperor Leopold I. in 1702. The city contains a fine library, and has many churches, the most remarkable being the Protestant church dedicated to St. Elizabeth, with a steeple 364 ft. in height (the highest in Prussia), and a splendid organ. The position of B., in the center of the manufacturing districts of the province, secures it a large trade, which its railway connection with all the important cities on every side, in addition to the facilities of communication which the Oder affords, enables it to turn to the best account. It has manufactures of linen, woollens, cotton, silks, lace, jewelry, machines, earthenware, soap, alum, starch, etc., and upwards of 100 distilleries; and a trade in corn, coal, metals, timber, hemp, and flax. B. is a city of Slavonic origin, and was for many centuries occupied alternately by the Poles and the Bohemians. It afterwards passed to Austria, from which it was taken by Frederick II. of Prussia, in 1741. Six years afterwards, it was captured by the Austrians, after a bloody battle, but retaken by Frederick in about a month. From that time until 1814, when its fortifications were completely demolished, it was frequently besieged.

BRESSA'NI, FRANCESCO GIUSEPPE, 1612-72; a Jesuit missionary among the Indians of Canada. In 1644, he was sent to the Huron country, but was captured and tortured by the Iroquois. After great suffering he was sent to the Dutch settlements at Albany, where he was ransomed for a large sum. He returned to France, but came back to missionary work and labored many years among the Hurons.

BRESSAY, one of the Shetland isles, e. of the Mainland, and separated from Lerwick by Bressay sound. It is 6 m. long and 2 broad, and is composed of Devonian rocks. It supplied Lerwick with peat, until the proprietor, fearing that the peat might be exhausted, stopped exportation; and it continues to supply the Shetland isles with slates. It has a small pop., chiefly fishermen. Bressay sound is one of the finest natural harbors in the world and is a rendezvous for herring-boats, and for all whalers and other vessels proceeding north. East of B., and separated from it by a narrow and dangerous sound, is a rocky isle, called Noss, 6 m. in circuit, girt on all sides by perpendicular cliffs, and rising abruptly from the sea to the height of nearly 600 ft., with a flattish top. A detached rock, or holm, on the s.e. side of the Noss, used to be communicated with by means of a cradle or wooden chair run on strong ropes, stretched across a yawning gulf, and admitting a man with a sheep to be drawn over at a time.

BREST, a strongly fortified city, in the department of Finistère, France, and one of the chief naval stations of the empire, is situated in lat. 48° 24' n., and long. 4° 29' w., on the n. side of the bay or road of Brest, which forms one of the finest harbors in the world. The only entrance to the bay is by a narrow channel called *Le Goulet*, which is scarcely a mile wide, and is strongly defended by batteries; the difficulty and danger of access to hostile ships being increased by certain rocks in the center of the channel. A new floating dock, quays, and pier were completed in 1876, at a cost of 22,500,000 francs. The small river Penfel flows through the town, which is, on the whole, irregularly built on an uneven site, and has steep, narrow, dark, and very dirty streets. In some parts communication between the lower and upper parts of the town can be effected only by stairs. The new quarter, the parade, and the quays, are more cleanly. B. has extensive ship-building yards, rope-walks, store-houses, etc.; its industry, indeed, is confined entirely to the equipment of the navy in its various branches. It has telegraphic communication with America by a submarine cable. The Bagnes (q.v.) or hulks no longer exist, the prisoners having been removed to the penal colony of Cayenne. Population in 1896, 74,538. B. is a very ancient place, but it was not of much importance until the 17th century. Its splendid position made it an object of contention to French, English, and Spaniards. In 1631, Cardinal Richelieu resolved to make it a naval station, and commenced the fortifications, which were completed by Vauban, but have since been greatly extended. In 1694, the English under lord Berkeley were repulsed here with great loss. In 1794, the French fleet, under admiral Villaret-Joyeuse, was defeated off B. by the English fleet under admiral Howe.

BREST-LITOVSK, a t. in the government of Grodno, Russia, 131 m. s. of Grodno, in 52° 5' n. and 23° 27' e., at the junction of the Mukhovetz and the Bug. It is the seat of an Armenian bishop, who has authority over the Armenians in all the country. It has a varied and extensive trade, by means of the two rivers and the royal canal, in grain, flax, hemp, birch-tar, leather, etc. Pop. '94, 44,140.

BRETAGNE, or BRIT'TANY (*Britannia Minor*), a peninsula in the n.w. of France, formerly a province, and now divided into the departments of Finistère, Côtes-du-Nord, Morbihan, Loire-Inférieure, and Ile-et-Vilaine, is surrounded by the sea on the n.w. and s.w. Though the height of the mountains is nowhere considerable, their structure gives to the peninsula a wild and savage aspect. Clay-slate forms the center of the country, and masses of granite rise in the n. and the south. The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered valleys, vegetation is luxuriant. In ancient times, B., under the name of

Armorica, was the central seat of the confederated Armorican tribes, who were of Celtic and Kymric origin. Traces of them still remain in the old Kymric dialect of the three most westerly departments, and in the numerous so-called Druidical monuments. The name *Armorica* was changed for that of B., in consequence of the numerous immigrations from Great Britain in the 5th and 6th centuries. The peculiar, shut-in situation, and the characteristics of soil and climate in B., seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; but often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. "The tenacity with which the Breton clings to the habits and belief of his forefathers, is apparent by his retention of the Celtic language almost universally in Basse B., and by his quaint costume, which in many districts is that of the 16th century." The greater number of the people are found to be ignorant and coarse in their manners, and their agriculture is of a very rude character, by no means calculated to develop the natural resources of the country. It is a frequent resort for tourists, and, apart from the beauty of its scenery, it possesses great interest, as the only place where men can be seen living and acting much as our forefathers did three centuries ago. Under the Romans, the country, after 58 B.C., was made the *Provincia Lugdunensis Tertia*; but its subjugation was hardly more than nominal, and it was entirely liberated in the 4th c., when it was divided into several allied republican states, which afterwards were changed into petty monarchies. B. became subject to the Franks in the reign of Charlemagne, and was handed over by Charles the Simple to the Northmen in 912. After some fierce struggles, the Bretons appear to have at length acknowledged the suzerainty of the Norman dukes. Geoffroi, count of Rennes, was the first to assume the title of duke of Bretagne in 992. The duchy of B. was incorporated with France in 1532, by Francis I., to whom it had come by marriage, and subsequently shared in the general fortunes of the empire, but retained a local parliament until the outbreak of the revolution. During the revolution, B., which was intensely loyal, was the arena of sanguinary conflicts, and especially of the movements of the Chouans (q.v.), who reappeared as recently as 1832. Daru, *Histoire de B.* (Par. 1826); Roujoux, *Histoire des Rois et des Ducs de B.* (Par. 1829); Courson, *La B. du 5^e au 12^e Siècle* (1863); Le Saint, *La B. Ancienne et Moderne* (1873); De Kerorguen, *Recherches sur les États de B.* (1875).

BRETHREN, WHITE, a sect of the 15th c. that sprang up in the Italian Alps. Their leader claimed to be Elias the prophet; they were clad in white, and carried crucifixes from which blood appeared to come. The leader, who appears to have left no name, prophesied the destruction of the world, and for a time had great success; but Boniface IX. seized the prophet and burnt him at the stake, and within a year the sect passed out of existence.

BRETHREN OF THE CHRISTIAN SCHOOLS, an order established at Rheims in 1679, and sanctioned by Benedict XIII. in 1725, having for its object furnishing the poor with instruction. In Paris, in 1792, they refused to take the oath of obedience to the civil constitution, and were driven from their houses and prohibited from teaching. In 1801, they returned and soon spread over France, Italy, and other countries. About 1830, they opened evening schools for adults. Their chief house is in Paris, and in 1868 they had more than 10,000 brethren, teaching 300,000 persons in France alone. There are a number of them in the United States. See LA SALLE, JEAN BAPTISTE DE.

BRETHREN OF THE HOLY TRINITY, a society of the 12th c., in France, whose members were pledged to give a third of their revenues towards the redemption of Christians who were in Mohammedan or infidel slavery.

BRETIGNY, a village of France, in the department of the Eure-et-Loir, about 6 m. s.e. of Chartres, on the railway between Paris and Orleans. B. is celebrated as the place where, in 1360, Edward III. concluded a peace with France, by which John II. of France was released from his captivity in England, on agreeing to pay 3 million crowns for his ransom, England renouncing her pretensions to Normandy, Anjou, Maine, and Touraine, and being confirmed in her possession of Gascony, Guienne, and several other parts in France recently acquired by conquest.

BRETON, ÉMILE, b. France, 1831; bro. of Jules. He became an artist in 1857, after trying the army, and business life. During the Franco-German war, he re-entered the army, commanding a battalion, and was decorated for bravery at the battle of St. Quentin. Among his landscapes are "Canal of Courrières," and "Sunset in Autumn."

BRETON, JULES ADOLPHE, b. 1827; a French painter, excelling in rural life and scenes; commander, Legion of Honor, 1889; recipient of many medals. Among his paintings are "The Gleaners," "Evening," "Blessing the Grain," "The Weeders," "The End of the Journey," etc. He published *Les Champs et la Mer*, poems (1875); *Jeanne*, a poem, for which he received the Montyon prize of the French Academy (1876); and *The Life of an Artist* (1890).

BRETON DE LOS HERREROS, DON MANUEL, the most popular of modern Spanish poets, was b. 19th Dec., 1800, at Quel, in the province of Logroño; received his earliest education in Madrid; and served as a volunteer in the army from 1814 to 1822. Subsequently he held several situations under government, but always lost them on account of his expression of liberal opinion. As early as his 17th year, he wrote a comedy,

entitled *A la Vejez Viruelas*, which, in 1824, was brought upon the stage with great success. Henceforward he furnished theatrical managers with more than 150 pieces, partly original, partly adaptations from the older Spanish classics, and partly translations from the Italian and French, most of which have been highly popular. In addition to these, Breton de los Herreros published *Poesías Sueltas* (Madrid, 1831, and Paris, 1840); several volumes of satirical verse; a long humorous poem, called *La Desvergüenza, Poema Jocosero* (Madrid, 1858), etc. All Breton de los Herreros's poems are remarkable for their singularly sweet, yet powerful diction, and for the harmony of the versification. His peculiar sphere is the comic and the satirical, in which the Spanish or national qualities of his genius find their freest expression, and in which also he displays most ease and self-reliance. Breton de los Herreros superintended the issue of a collected edition of his poetical works in 1850-52 (5 vols., Madrid). He died at Madrid in Nov., 1873.

BRETSCHNEIDER, HEINRICH GOTTFRIED, a man remarkable for his unsettled life, eccentric habits, and satirical writings, was b. at Gera, Mar. 6, 1739. He was first sent for education to the institute of Herrnuthers at Elbersdorf, and afterwards to the gymnasium at Gera. He became capt. of horse in a Prussian volunteer corps, in which service he was made prisoner, and retained in a French fortification till 1763. In 1775, B. visited England, France, and Holland; and in 1778 was nominated librarian to the university of Ofen, where he was persecuted by the Jesuits, whose hatred he had excited. This circumstance brought him under the notice of Joseph II., who, in 1782, appointed him one of the inspectors of studies. He died in Nov., 1810. B. was the author of tales, poems, and satires. The latter are attacks upon every kind of injustice and falsehood. In his "*Almanac of the Saints (Almanach der Heiligen)*" for the year 1788, with copper-plates and music, printed at Rome, with the permission of the principals," the priesthood is severely attacked, and the legends of the monks ridiculed. Like Nicolai, B. was very bitter against the "Werther" mania which was so prevalent in his time.

BRETSCHNEIDER, KARL GOTTLIEB, a distinguished German theologian, b. 11th Feb., 1776, at Gersdorf, in Saxony, studied theology at Leipsic, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and in 1840 obtained the dignity of a counselor of the upper consistory. He died 22d Jan., 1848. B. has acquired a reputation for sober, reflective, rationalistic thought. The character of his intellect rendered him unable to enter into the profound speculations of men like Schleiermacher and Schelling; but nevertheless, by his diligence, clear, incisive understanding, and strength of character, he has secured a permanent place in the history of German theology. His most important work in dogmatics is the *Manual of the Evangelical Lutheran Church* (2 vols., Leip. 1814-18). In 1824, B. published *Lexicon Manuale Græco-Latinum in Libros Novi Testamenti* (2 vols., Leip. 1824). In 1832, appeared *Der Simonismus und das Christenthum*; in 1835, *Die Theologie und die Revolution*. B. also published many sermons, which have been well received, and in other departments of theology and literature he is considered to have done important service.

BRETT, WILLIAM BALIOL, first LORD ESHER, jurist, b. Chelsea, England, in 1815; called to the bar, 1846; solicitor-general, 1868; judge, 1868-76; lord justice of appeal, 1876-83; appointed master of the rolls, 1883; and raised to the peerage in 1886.

BRET TEN, a t. of Baden, about 13 m. e. of Carlsruhe, chiefly noteworthy as the birthplace of Melancthon. The house in which he was born is pointed out to travelers. Pop. about 4000.

BRETTS AND SCOTS, THE LAWS OF THE (Lat. *Leges inter Brettos et Scotos*, old Fr. *Lusage de Scotis et de Bretis*), the name given, in the 13th c., to a code of laws in use among the Celtic tribes in Scotland. The "Scots" were the Celtic people dwelling in the western and more mountainous districts n. of the Forth and the Clyde, who, when it became necessary to distinguish them from the Teutonic inhabitants of the low country, received the names of "the wild Scots," "the Irishry of Scotland," and, more recently, "the Scotch highlanders." The "Bretts" were the remains of the British or Welsh people, who were at one time the sole or chief inhabitants of the region now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, Dumfries, and Cumberland. This province was for some centuries an independent kingdom, known by the names of "Cambria," "Cumbria," "Strathclyde," and "Strathclyde and Reged." It became, about the middle of the 10th c., a tributary principality held of the king of the English, by the heir of the king of the Scots. It so continued till after the beginning of the 12th c., when Cumberland having been incorporated with England, the gradual absorption of the rest of the territory into the dominions of the king of the Scots seems to have been imperceptibly completed. The last "prince of Cumbria" named in record was the brother and heir of king Alexander I. of Scotland, "the earl David," as he was called, who, on his brother's death in 1124, himself became king of the Scots. No more is heard of Cumbria as a principality; but "the Welsh" continue to be named among its inhabitants, in the charters of king David's grandsons—king Malcolm the Maiden (1153-65), and king William the Lion (1165-1214). And they seem to have retained more or less of their ancient Celtic laws until after the

beginning of the 14th century. It was not till the year 1305 that an ordinance of king Edward I. of England, who appeared then to have reduced all Scotland to his subjection, decreed "that the usages of the Scots and the Bretts be abolished, and no more used." It is unknown how far this prohibition took effect. Of the code which it proscribed, only a fragment has been preserved. It was first printed by sir John Skene, in his *Regiam Majestatem* (Edin. 1609). But by far the best edition is that of Mr. Thomas Thomson and Mr. Cosmo Innes, in the *Acts of the Parliaments of Scotland*, vol. i. pp. 299-301 (Edin. 1844), where the laws are given in three languages—Latin, French, and English. The French version, which is the oldest, is printed from a manuscript of about 1270, formerly in the public library at Bern, in Switzerland, now in the register house at Edinburgh. The fragment of the "laws of the Bretts and the Scots" thus published, is of much the same nature as the ancient laws of the Anglo-Saxons, the Welsh, the Irish, and other nations of Western Europe. It fixes the *cro*, or price at which every man was valued, according to his degree, from the king down to the churl, and which, if he were slain, was to be paid to his kindred by the homicide or his kindred. The *cro* of the king was 1000 cows; of the king's son, or of an earl, 150 cows; of an earl's son or of a thane, 100 cows; of a thane's son, 66½ cows; of the nephew of a thane, or of an oghthiern, 44 cows and 21½ pence; and of a villain or churl, 16 cows—all persons of lower birth than a thane's nephew, or an oghthiern, being accounted villains or churls. The *cro* of the married woman was less by a third than the *cro* of her husband. The *cro* of the unmarried woman was as much as the *cro* of her brother. Other chapters fix every man's *kelchyn* or *gelchach*, *gallnes*, and *enauch*—Celtic terms not yet satisfactorily interpreted, but apparently equivalent to the *fyhtwite*, *mund*, and *manbot* of the Anglo-Saxon, as the *cro* of the Bretts and Scots appears to answer to the *werigild* of the English. A chapter "of blood-drawing"—corresponding with the *blodryfte* of the Anglo-Saxons—fixes the fine to be paid for a blow to the effusion of blood, according to the degree of the person wounded and the place of the wound.

BREUGHEL, or BRUEGHEL, the name of a famous family of Dutch painters.—PETER B., the head of the family, was b. in the village of B., near Breda, in 1510 (or, as others say, 1520), and d. at Brussels in 1570 or 1590. He was a scholar of Peter Koeck van Aelst, traveled through Italy and France, and on his return, fixed his residence at Antwerp. He painted chiefly the pleasures of rustic life, for which he himself had a great relish, and which he transferred to his canvas with clear insight and vivid coloring, though unnecessarily exceeding at times the coarseness of his subject. He also executed several historical pieces, such as his "Building of the Tower of Babel," now preserved in the gallery at Vienna.—His son, PETER B., distinguished by the strange title "Hellish Breughel"—because he loved to paint scenes in which the leading characters were devils, hags, robbers, etc.—was b. about 1564, and d. about 1637. His paintings of "Orpheus" and the "Temptation of St. Antony" are the most remarkable of his pieces.—JAN B., brother of the preceding, and on account of the splendid apparel which he wore when he became rich, usually called Velvet B., was b. 1568, and d. 1625. He was an industrious painter, distinguished for his landscapes and for his minute finish of small figures. In concert with Rubens, who supplied the two chief figures, he painted "Adam and Eve in Paradise," and "Vertumnus and Bellona." These, with the "Four Elements," are his chief works.—Other members of the same family were known as painters: AMBROSE B., director of the academy of painting, Antwerp, between the years 1635 and 1670; ABRAHAM B., a painter of fruits, flowers, and birds, lived long in Rome and Naples, where he d. in 1690; JAN BAPTIST B., b. in Rome, d. 1700; and finally, CASPAR B., both of whom were flower-painters.

BREVARD, a large co. in s.e. Florida, on the Atlantic ocean; 2446 sq.m.; pop. '90, 3401. It is low, flat, and full of lakes and marshes. Along the coast is Indian river, an inlet of the ocean. Co. seat, Titusville.

BREVE. See ANT-CATCHER.

BREVE, a note in music, which, in the old notation of Guido d'Arezzo, had the value of two whole bars. It is written thus, \sqcap , or \sqcup , or $\sqcup\sqcup$. The note for a whole bar in modern notation is called semibreve, and has the value of four crotchets. In triple time, the B. contained three semibreves. The B. is now only used in a *la capella* movements, psalm-tunes, and fugues, or at the close of a composition.

BREVE, or BRIEVE, in the practice of the Scotch law, is a writ issuing from chancery in the name of the crown, to a judge, ordering him to try by jury the points or questions stated in the breve. In ancient times, these writs appear to have been the foundation of almost all civil actions in Scotland; but they are now only used in the following cases: 1. B. of inquest, now, however, superseded by a petition of service, according to the 10 and 11 Vict. c. 47. The object of the proceeding is judicially to ascertain the heir of a deceased person. 2. B. of tutory, the purpose of which is the appointment, as guardian to a pupil, of the nearest agnate or person most nearly related through the father. 3. Breves of idiocy and furiosity, by which the mental condition of a party may be determined for the appointment, in case of ascertained insanity, of a guardian or curator. In the B. of idiocy, the direction is to inquire whether the person is of unsound mind, furious, and naturally an idiot. In the breve of furiosity, it is whether

he be of unsound mind, prodigal, and furious. 4. B. of terce. The object of this writ is to "cognosce the widow to her terce"—that is, to enable her to recover her terce or dower. It is issued to the sheriff of the county, and the jury under his presidency are directed to inquire whether the claimant was the lawful wife of the deceased, and whether the husband died infest in the lands from which the terce is claimed. The verdict of the jury gives the widow her terce, and the judge then "kens" her to it. See **TERCE**, and **KENNING TO THE TERCE**. 5. B. of division amongst heir-portioners. By means of this B., an heir-portioner—that is, one of two or more sisters succeeding in equal portions to a landed estate—may have her share of the lands separated or set apart by a judge, who appoints an inquest, or jury of fifteen persons, to measure the land, and make a division; the jury report to the judge; and lots being cast for the different shares, the judge decides accordingly. The form is, however, now seldom used, an arbitration being more generally resorted to. See **INHERITANCE**, **SUCCESSION**, **HEIRS-PORTIONERS**.

BREVET (French) meant originally a warrant, or license, or authorization for the use of some privilege, rank, or title. As a military term it is used both in England and in this country. In the United States it is a commission giving to an officer a nominal and temporary rank higher than that for which he has a salary. Many *brevet* titles were thus given during and after the civil war. In England, the term once designated a promotion given on some special occasion, as, for example, a coronation, or the termination of a great war, and was limited to officers who had some special claim to the distinction. The officers so promoted obtained an increase of rank, and in some cases pay, even if they had never served in the field. A brevet was determined on by the cabinet, and carried out by the commander-in-chief. The officers expected it, as one of the implied conditions on entering the service, and it has formed part of the British military system since the time of James II.; but it was unsatisfactory because the flow of promotion caused by it was arbitrary, uncertain, and much liable to abuse. There were brevets, arising out of the various circumstances above indicated, in 1837, 1838, 1841, 1846, 1851, and 1854. On these occasions lieutenant-generals, major-generals, colonels, lieutenant-colonels, majors, and captains received a promotion of one grade in rank. On one of these occasions 200 colonels were at once made major-generals. The higher the rank, the higher the pay, as a general rule; and therefore the cost to the nation is always increased for a time after each brevet. Thus the brevet of 1837 occasioned an annual increase of £11,000; that of 1838 £7000; of 1841 £15,000; of 1846 £21,000; but it must not be forgotten that death and sales had in the intervals cleared off perhaps an equal number of officers at the higher rates of pay. In 1854 the new major-general alone involved an additional charge of £18,000 a year. In the latter year the giving of brevets was limited very strictly in its application to cases of very distinguished service in the field, and on the principle of seniority.

BREVIARIUM ALARICANUM, a collection of Roman laws compiled by order of Alaric II., king of the Visigoths, in 506 A.D. The chief value of this compilation is that it preserves the first five books of the Theodosian code and five books of the *Sententie Recepte* of Julius Paulus, which are nowhere else found.

BREVIARY. By this word the Roman Catholics understand the book which contains all the ordinary and daily services of their church, except (a) those connected with the celebration of the Eucharist, which are contained in the *Missal*, and (b) those for special occasions, such as baptism, marriages, ordinations, funerals, etc., which are contained in the *Ritual* (q.v.) or *Pontifical*, according as they fall within the sphere of ordinary priests or of bishops. The word itself signifies an *abbreviation* or *summary*, and is used to indicate that the book is a compilation designed to obviate the necessity of using several books in the same service. An Anglican *Church Service* is a compilation on exactly the same principle and for the same object as well as very similar in contents. The breviary is believed to owe its origin to Gregory VII. in the 11th century. It underwent several changes under succeeding popes, and in 1536, Francis, Cardinal de Quiñones, a Spaniard, published at Rome a reformed breviary which, though perhaps too sweeping in its changes, had the approval of the pope and is of great merit, insuring the reading of the whole Book of Psalms every week, and of almost all the New Testament and a great part of the old every year. Though never made compulsory, its use was permitted in place of the unreformed breviary, until, in 1568, Pius V. issued a reformed edition of the old Roman breviary which he imposed absolutely upon all the Latin churches. This breviary was modified from time to time chiefly by the addition to the calendar of a great number of feast-days in honor of saints, to such an extent that the ordinary service of a week-day became very uncommon, and finally, in 1883, Pope Leo XIII. permitted, though not commanded, the substitution for the week-day service, upon almost every day in the year, of a voluntary office of a festival character according to the day of the week. The state to which the use of the breviary is thus reduced, especially by the virtual abrogation of the weekly reading of the Book of Psalms, is acknowledged on all sides to need reform, and it is probable that a revision on the lines followed by Quiñones will soon be made. The principal Latin breviaries now in use, other than the Roman, are the Monastic, used by all monks and nuns properly so called; the Dominican, used by all disciples of St. Dominic; the Ambrosian, in the

ecclesiastical provinces of Milan ; and the Mozarabic, the original national rite of Spain, in use in part of the cathedral and city of Toledo. Wherever the Roman breviary has been introduced it has been subjected to additions to the calendar and other changes, so as to give it a national color. The contents of the breviary, after the general rubrics, tables, calendar, etc., are divided into five parts. The first consists of the Book of Psalms, arranged in section, with different prayers and hymns to be used in the various services of the day and week. The second part of the breviary consists of the *Proprium de Tempore*. This means the whole service for Sundays and week-days as dependent upon Christmas and Easter. The third is the *Proprium Sanctorium*, or special offices of saints, and consists of whatever is special to any day, fixed by the day of the month. It amounts to a series of brief biographies of the saints, which, though drawn up with great care and revised from time to time, show occasional inaccuracies and present a point of attack to controversialists. The fourth part, the *Commune Sanctorium*, is a series of twelve offices for festivals of saints according to the class to which they belong. The Commune Sanctorium is more used than any other part of the breviary. The fifth and last division of the breviary consists of an extra service, the principal of which are the vespers (placebo), and matins, and lauds (dirge) of the dead, and the Little Offices of the Blessed Virgin Mary. While objection may be made to the defective character of the course of scriptural reading, to the biographical notices, and to the practical monotony caused by the multiplication of festal offices, the breviary forms a marvellous mine of powerful and tender religious thought, and as at every separate service nearly all, or by far the largest part of the matter used is the language of Scripture, the office is invested with great grandeur and vitality. The readings form a sort of storehouse, though imperfect, of scriptural, historical, and theological knowledge. The rules for arranging the service for every day, and especially for uniting and harmonizing the *Proprium de Tempore* with the *Proprium Sanctorium*, are contained in the general rubrics, and fill 87 chapters ; but so complicated has the system become that it has been found necessary to meet the difficulty by the publication in every separate country or diocese of a sort of annual almanac, called the *Ordo Recitandi Divini Officii*, which contains under every day, clothed in a mass of technical contractions, minute directions as to what is to be read. The duty of publicly joining in, or privately reading aloud, the whole of the breviary services every day, is incumbent upon all clerks in holy orders, all members of religious orders, male or female, and every person holding a benefice (such as a prebend) to which attendance in choir is normally attached. The use of the breviary as a book of private devotion by laymen has become rare since the invention of printing has led to the multiplication of devotional works of different kinds, but at present seems to show some tendency to increase, and it has always been a common custom to sing vespers or compline, at least on Sundays, in parochial and other public churches.

BREVIARY OF QUIGNON, a breviary (q.v.) published at Rome about the year 1536 by Cardinal Quignonez or Quiñones. It is said that upon this work the daily service of the established English church is largely modeled, some parts of the preface being embodied entire in that of the Book of Common Prayer (q.v.).

BREVIER, a kind of type (q.v.).

BREWER, a city in Penobscot co., Me., on the Penobscot River and the Boston and Maine railroad; opposite Bangor, with which it is connected by a bridge. It was incorporated as a city in 1889, and has banking facilities, manufactories of wood pulp, paper, and other articles, and large lumber interests. Pop. '90, 4193.

BREWER, DAVID JOSIAH, jurist; b. in Asia Minor, in 1837; graduated at Yale in 1856 and at the Albany (N. Y.) law school in 1858; was for several years a judge in Kansas; became an associate justice of the U. S. supreme court in 1889; member of the Venezuela commission in 1896; and one of the arbitrators for Venezuela under the Anglo-Venezuelan arbitration treaty in 1897.

BREWING. Brewing is one of the two processes that are together employed in manufacturing beer from barley, the other being malting. Malting has four stages: *steeping*, *couching*, *flooring*, and *kiln-drying*. Steeping consists in soaking the grain for several days in cold water, by which operation it is softened and swelled, and made to absorb some 30 to 40 per cent. of water. Couching consists in throwing the moistened barley on the malt-house floor when it begins to germinate, throwing out roots and shoots, and giving out at the same time a part of the water. Flooring consists in turning and returning the barley upon the floor to prevent the continuance of the incipient germination. Kiln-drying consists in heating the barley in a kiln, rendering it dry and brittle, when it becomes malt. By this process the original grain has become increased in bulk but has lost in weight.

The next process in the manufacture of beer is *brewing* proper. The malt is passed between heavy rollers that crush it, after which it is placed in a tube containing warm water that is slowly heated to 170° Fahrenheit. It is at this stage of the process that adulterants are sometimes added, usually glucose (q.v.). After the infusion has been allowed to stand for three or four hours, the *wort* is drawn off into a boiler, in which

hops are presently placed, and boiled with the wort. From two to four bushels of malt, and from two to five pounds of hops are used in making one barrel of beer, the quantity determining the strength of the beer. See *HOP*. As soon as the boiling is over, the resulting liquid is cooled with great rapidity, usually by passing it over pipes containing a running stream of cold water. Last of all it is collected in the brewery vats where it ferments, the temperature being regulated to secure quick or slow fermentation. Yeast is usually added to the wort in the proportion of 1 part to 100 parts of wort. After the beer has fermented for a week or so, the beer is separated from the yeast and placed in casks. In these fermentation goes on slowly, and the beer becomes refined and matured. The nature of the beer depends largely upon the kinds of malt that are employed. Thus, *ale* is made from pale malt, and had the active fermentation checked. If the malt has been sun-dried and its fermentation takes place at a temperature less than 70°, the resulting liquid is *pale ale*. *Porter* is made from pale, dark, and black malt mixed. *Lager* ("stored") *bier* is beer that has been stored in a cool place for some months before it is used. Hence it is usually fermented in winter, or if in summer, in vaults cooled by ice. The principal constituents of the various kinds of beer are water, alcohol, sugar, gum, gluten, and the bitter extractive matter of the hop. The amount of alcohol varies: in small-beer, it is only about 1 per cent.; in ale, the stronger kinds of beer and porter for home consumption, 5 to 7 per cent.; in East India pale ale, 10 per cent. In beer intended to be forwarded to California from Britain the attenuation is carried so far that there is more than ten per cent. of alcohol, and the beer is then called *dry*. The successful brewing of beer depends much on the kind of water employed. The water which is found most suitable contains much common salt, sulphate of lime, and carbonate of lime, in a state of solution. The waters employed in the most extensive breweries contain at least 60 grains of earthy salts dissolved in each imperial gallon. Great care must be taken to select water which not only has the proper amount of saline ingredients, but at the same time is free from organic matter, either of animal or vegetable origin. Water containing such is liable to the decomposition and putrefaction of its constituents, and by contamination, causes the beer prepared by means of it to be more liable to go wrong in the brewing, and to possess ultimately an unpleasant taste. Lime salts are thought to render the beer clearer. See *BEER*, *ALE*, *BOCK BIER*; *FERMENTATION*; *LAGER BIER*.

BREWSTER, a co. in W. Texas; 2640 sq. m.; pop. '90, 710. Co. seat, Alpine.

BREWSTER, BENJAMIN HARRIS, b. Salem co., N. J., 1816; graduated at Princeton college, 1834; admitted to the bar of Philadelphia, 1838; and soon rose to the head of his profession. He was appointed atty.-gen. of Penn., 1867, and atty.-gen. of the U. S. under Pres. Arthur, Dec. 16, 1881. He d. 1888.

BREWSTER, Sir DAVID, an eminent natural philosopher and eloquent writer, was b. at Jedburgh, Dec. 11, 1781. He was educated for the church of Scotland at the university of Edinburgh, where he highly distinguished himself. In 1808, he undertook the editorship of the *Edinburgh Encyclopædia*, to which he contributed many important scientific articles. Previous to this, he had entered deeply on the study of optics, with which his name is now enduringly associated. The beautiful philosophical toy, called the kaleidoscope, was invented by him in 1816. In 1819, in conjunction with Prof. Jameson, he established the *Edinburgh Philosophical Journal*; and in 1831 he was one of the chief originators of the British association for the advancement of science. The honors conferred on this distinguished man make up a long catalogue. In 1815, he obtained the Copley medal of the royal society for one of his optical discoveries, and soon after was elected a fellow; in 1816, he received half the physical prize bestowed by the French institute for two of the most important scientific discoveries made in Europe during the two preceding years; in 1819, the royal society awarded him the Rumford gold and silver medals, for his discovery on the polarization of light; in 1825, he became corresponding member of the institute of France; in 1832, he was knighted, and had a pension conferred upon him; in 1838, he was chosen principal of the united colleges of St. Leonard and St. Salvador, St. Andrews; in 1849, on the death of Berzelius, in the preceding year, he was elected one of the eight foreign associates of the French Institute, the highest scientific distinction in Europe. Sir David was also a member of the imperial and royal academies of St. Petersburg, Berlin, Copenhagen, and Stockholm; presided over the British association, and in 1851, over the peace congress held in London. In 1859, on the death of Dr. John Lee, he was chosen principal of the Edinburgh University. His principal work is his *Life of Newton*, first published in 1828, in the *Family Library*, and issued in a totally new and greatly enlarged form in 1855. Among his other works are his interesting *Letters on Natural Magic*, addressed to Sir Walter Scott, also published in the *Family Library*; *More Worlds than One* (1854); his treatises on the kaleidoscope and on optics (*Cabinet Cyclopædia*); his *Martyrs of Science*; and his treatises in the *Encyclopædia Britannica* on electricity, magnetism, optics, the stereoscope, etc. Among other periodicals to which he contributed largely are the *Edinburgh* and *North British Reviews*. He died Feb., 1868. See *Home Life of B.* by his daughter, Mrs. Gordon.

BREWSTER, WILLIAM, 1560-1644; b. England; one of the pilgrims who landed at Plymouth. He went with Bradford to Holland, where he taught school in English, became an elder in the church, and held the same position in New England, though, as he had never been ordained, he always refused to administer the sacraments. He is more generally known in history as "Elder Brewster."

BREZO'WA, a market t. of Hungary, in the co. of Neutra, on a river of the same name, about 19 m. n.w. of Leopoldstadt. It has a Roman Catholic church and a Protestant church, tanneries and distilleries. Pop. 5700.

BRIALMONT, HENRI ALEXIS, b. 1821; a Belgian engineer and military writer, and member of various learned societies. He has published a number of works on the art and methods of military fortifications, on which he is accepted as one of the best authorities. He was made lieut.-gen., 1877, and was afterward retired.

BRIAN BOROIMHE (pron. *boru'*), a famous king of Ireland, ascended the throne of both Munsters—answering to the present counties of Tipperary and Clare—in 978. Some time afterwards, he deposed O'Maelachaghlin, and became supreme ruler of Ireland. The surname, Boroimhe, signifying tax, was given him in consequence of the tribute in kind he levied from the various provinces. King Brian supported a rude but princely state at his chief castle at Kincora, a place in the neighborhood of the modern town of Killaloe, and he had also seats at Tara and Cashel. The vigor of his reign brought prosperity to his country. He defeated the Danes in upwards of 20 pitched battles, restricting their influence to the four cities of Dublin, Wexford, Waterford, and Limerick alone. In the battle of Clontarf (1014), in which he was killed, he gained a signal victory over a united army of revolted natives and Danes, the power of the latter receiving a shock from which it never recovered.

BRIANÇON (ancient *Brigantium*), a t. of the department of the Hautes-Alpes, France, on the right bank of the Durance, about 35 m. n.e. of Gap. It is the highest town in France, being situated at an elevation of nearly 4300 ft. above the level of the sea. As the principal arsenal and depot of the French Alps, B. is very strongly fortified, while several forts guard the approaches, and every height in the vicinity is a point of defense. It is considered impregnable. Troops can readily be marched from it on to the passes of the Simplon, St. Bernard, Mont Cenis, and the Col de Tende. Mont Genève affords a practicable passage into Italy from the town itself. B. has some manufactures of silk, cotton-goods, hosiery, cutlery, crayons, etc. Pop. '86, exclusive of garrison, 3360; '91, 6580.

BRIANSK', or BRYANSK, a town of Russia, in the government of Orel, 90 miles by rail west of the city of that name. It is situated on the right bank of the Desna, is surrounded with earthen ramparts, and has a considerable trade in grain, hemp, timber, etc., with Kherson, Odessa, and other ports on the Black sea. Population estimated at 20,200.

BRIARE, a t. in the department of Loiret, France, situated on the right bank of the Loire, at the point where the canal de Briare enters that river, about 43 m. s.e. of Orleans. The canal, which unites the Loire and the Seine, is remarkable as the first that was constructed in France, having been begun by Sully, and finished in 1642. B. has a considerable trade in wine, wood, and charcoal. It is supposed to occupy the site of the ancient *Brivodurum*. Pop. about 5400.

BRIA'REUS, or *ÆGEON*, one of the three sons of Uranus and Gæa; the others were Cottus and Gyges, and each of the three had a hundred arms. They assisted Zeus when the Titans made war against Olympus. One account represents B. as assailing Olympus and being defeated and buried under Mt. Etna. As B. is sometimes called a marine deity, it has been thought probable that the hundred arms symbolized the waves of the sea.

BRIBERY is the offering, promising, giving or receiving of money, goods, employment, or personal advantage of any kind with a view to influence unlawfully the receiver in the exercise of a public duty. Such public duties are those of judges, legislators, executive officers of government or state, voters in the exercise of the suffrage, customs officers, and others. A contract founded on such a consideration is absolutely and totally void. The person giving, as well as the one receiving the bribe, is guilty of the crime of bribing. The action of the public officer, or voter, may be influenced negatively as well as positively by bribery; that is, he may be bribed to abstain from the proper exercise of his functions as well as to exercise them unlawfully. It has been held, however, that the offense does not include an unaccepted offer by a public official to accept reward for performing an act (36 Texas, 293). Severe penalties are provided by act of Congress for the offense of bribing members of Congress or other officers of the United States, such as customs officers, jurors of the United States courts, or officials connected with the letting of public contracts. A member of Congress may be accused of receiving bribes either to influence his vote upon a matter of legislation, or to procure appointments through his official influence; in 1870, one member of Congress was expelled and one resigned on account of charges alleging a corrupt distribution of patronage. The several states in their statutes and codes define the offense as applied to courts, officers, and voters within their jurisdictions, and they impose severe penalties of fine or imprisonment, or both, on conviction for bribery.

Judicial bribery is defined by Greenleaf as the "receiving or offering any undue reward by or to any person whose ordinary profession or business relates to the administration of public justice, in order to influence his behavior in office and incline him to act contrary to the rules of honesty and integrity." It is a matter of congratulation that the higher courts of this country have been almost uniformly free from the taint of sus-

picion of bribery. The United States Supreme Court has a spotless record in this particular, and so almost invariably have the higher courts of the several states. In Great Britain, also, during this century, the higher courts of justice have rarely if ever been impeached in this way. How stern a punishment was meted out for this offense in former times is shown by the penalty inflicted on Lord Bacon, the greatest and ablest judicial officer against whom the charge of bribe-taking was ever brought; a fine of £40,000 was imposed, together with the sentence of imprisonment during the royal pleasure, in addition to civil and judicial disabilities laid upon him. In the United States, perhaps the most serious era of judicial corruption was that during the power of the Tweed ring in New York state; in that state in 1871 one judge of the Supreme Court was impeached and removed from the bench, another judge of the same court resigned, and one judge of the Superior Court was tried by the State Senate and dismissed in disgrace. Any attempt to bribe a court is technically contempt, and the offender may be dealt with by the court upon that charge.

Of greater importance and more general danger to the public welfare in our day than judicial corruption, is bribery intended to affect the exercise of the right of suffrage. In England, during the early part and middle of this century, corruption in parliamentary elections was so common as to be the rule rather than the exception. This was due in part, perhaps, to the restriction of suffrage; certainly in great measure to the rotten borough and pocket borough system (see *Borough*). The Ballot Act was expected to produce a very beneficial result in this direction, but its influence was only partial; in England, as has since proven the case in the United States, the common method of balloting gave too many opportunities to the purchaser of a vote to see that it was cast according to the corrupt bargain. The election law of 1854 was a very stringent one; it defined closely and with great elaboration the crime of bribery in elections, made the offense a misdemeanor, and inflicted a fine of £100 and costs to be paid by a convicted offender to any one who might sue and prove the offense; "treating" was also defined and made an offense, and punished by a fine of £50; any person found guilty of accepting a bribe was to be struck off the polling list; while a candidate for election found guilty of bribery was made incapable of sitting for that borough, county or city in that session of parliament. Notwithstanding this stringent law, bribery continued alarmingly prevalent; it has, however, been wonderfully decreased by two subsequent measures. By one of these (1868) the investigation of disputed election cases was transferred from parliament itself to the judges of the superior courts. The report of the judges holding such an investigation was made to have the effect of a report of an election committee, and on their certificate a commission of inquiry issued. A candidate for election reported by the judges as guilty of bribery was made incapable of election to parliament for seven years. Similar action to this on the part of the American House of Representatives has been seriously urged of late years. It is argued that the necessity of such action is evident from the fact that disputed election cases are almost invariably decided by a strict party vote. The record of the Congress in session in 1890 will be found to afford a striking confirmation of this statement. On the other hand it is argued that it would require an amendment to the constitution to make such a change of procedure possible. It may well be questioned whether even so radical a step as a constitutional amendment may not be called for. The other anti-bribery law of England referred to was the Corrupt Practices Act of 1883, mainly the work of Sir Henry James. It aims to prevent the *payment* of bribes in the first place rather than to punish the *receipt* of them after the act. It strictly forbids the disbursement by a candidate for parliament, or his agent, of money for any conceivable purpose connected with his election, whether legal or illegal, beyond a certain sum, which is fixed in proportion to the number of voters in the borough; thus, in a borough of 2000 voters an expense of £350 is allowed if one member is to be elected, and £525 if two are chosen, while a borough of 66,000 voters is allowed an expenditure of £3000, the maximum. Only one person may make disbursements, either the candidate himself or his authorized agent; and an account must be returned to the proper public official under oath, with vouchers attached of every penny disbursed. So stringent is this rule, that while in the first election held under the law, only one case was reported where the expenditure exceeded the allotted amount, and that case clearly accidental, yet the member involved was forthwith unseated. Under this law it has been held that circumstances may make a public loan, a large subscription to a charity, the employing of electors in public works, or even the giving of a holiday to workmen, a bribery. Heavy penalties in the way of fines and the disenfranchisement of offenders are attached to the violation of the provisions of the law. By an act passed in 1884 English municipal elections were placed under the same general regulations as those for members of parliament.

It has been proposed to introduce into the United States these principles, namely, of limiting the amount to be expended by a candidate for election, of requiring him to submit accounts of his expenditures with vouchers, and of demanding that he take oath as to their correctness. In the State of New York an act of generally similar provisions (but not universal in its application) was passed in 1889. Its partial failure is to be attributed to the fact that the special conditions under which elections are carried on in this country—nomination by caucus, party representation, and the general conduct of the election by the party rather than the individual candidate—were not duly allowed

for. A more effective kind of legislation against corruption at the polls in this country has been the adoption by several states in one form or another of the so-called Australian system. (See BALLOT.) Massachusetts, in 1889, New York, in 1890, Connecticut, Indiana and several other states about the same time, have applied this system with beneficial results. Briefly stated, its main points are : (1) an official ballot—all ballots to be printed and distributed by the state, of uniform size and style ; (2) secrecy in preparing and marking the ballots ; a voter receives from an officer ballots containing the names of candidates of all parties ; he then retires to a booth where, in seclusion, he marks the names of those for whom he intends to vote, folds up all the ballots given him, hands the one he votes to the proper inspector, and returns the others to be destroyed. Details of the laws of this kind adopted by the different states need not be entered into here ; the main objects, which have been very generally accomplished, have been to keep outsiders from watching or interfering with the voter, to prevent a possible briber from knowing whether the bargain he has made has been actually carried out, and to give the voter every possible opportunity to exercise his will without observation or undue influence. See BALLOT.

BRIC-A-BRAC, a word formed from the French proverbial expression *de bric et de broc* (which finds a near equivalent in the English "by hook or by crook"), and used to denote a miscellaneous collection of articles of vertu, such as bibelots, curios, odds and ends of pottery, and knickknacks of every description. The rage for collections of this kind sprang up in Europe about twenty years ago. At first it was sporadic, attacking only a few people of wealth and leisure, but it soon developed into an epidemic, crossed the Atlantic about the time of the centennial exhibition in Philadelphia, and covered our shelves and mantelpieces with costly, elegant, grotesque, or ingenious baubles, and our walls with Japanese fans and porcelain dishes of uncouth proportions. Associating itself with the coteremporary craze for decorative art, it found fanatical disciples whose published utterances seemed to imply that the souls to whom Christianity was an obsolete superstition might be regenerated by the saving influences of blue china. The bric-à-brac hunter rivaled the bibliomane in the extravagant prices that he paid for bibelots and curios merely on account of their antiquity or rarity, and without regard to their design, form, color, or beauty. But the first extravagances of the new fashion have almost subsided, and they have left behind in many quarters a genuine love for and appreciation of artistic ceramics, which speaks well for the art future of our country. See BIBELOT.

BRICK. The earliest examples of this branch of the ceramic art were doubtless the sun-dried bricks of Egypt, Assyria, and Babylonia. Remarkable to say, many of these, which, in a northern climate, the frosts of a single winter would destroy, have been preserved for some 3000 years by the dry, warm atmosphere of those countries. Sun-baked bricks of ancient date are also found in the mud walls of old towns in India. Kiln-baked bricks must have been the products of a later time ; but they are found in all the chief ruins of ancient Babylonia, where they were often used to face or bind together walls of sun-dried bricks, and occasionally they were even ornamented with enameled colors. Burnt bricks were employed in the foundations of the tower of Babel (Gen. xi. 3). These ancient bricks, whether baked by the sun or by fire, were all made of clay mixed with grass or straw. The ancient Greeks, probably owing to their possessing plenty of stone, cared little for building with burned clay ; but most of the great ruins in Rome are built of brick, and the Romans appear to have introduced the art into England. Interesting historical information has been obtained from the impressions on Roman and especially on Babylonian bricks. In many instances, the Roman bricks found in England have been removed from their original position, and employed in the construction of buildings of later date. The earliest instance in which bricks of the modern or Flemish make occur in England, is Little Wenham hall, in Suffolk, 1260.

Manufacture of Bricks.—Clay suitable for the manufacture of common bricks is an abundant substance, but there is a great difference in the nature and quality of the clays found in various localities. The basis of clay consists of hydrated silicate of alumina, with a varying proportion of other mineral matters, chiefly free silica (sand), iron, lime, magnesia, and potash. Great advantage is derived from digging clay in autumn, and exposing it all winter to the disintegrating action of frost. This is not always attended to, but when neglected, the bricks made from it are apt to be unsound, and faulty in shape. The next process is that of tempering or mixing the clay into a homogeneous paste, which is sometimes done by the spade, but more commonly in the pug-mill (see article Pottery) or by crushing between a pair of rollers ; often, indeed, both are employed. In making bricks by the old hand process, the shape is given by a mold either entirely of wood, or of wood faced with metal, and without top or bottom. This admits of the clay being pressed into it by a tool called a plane, which is also used to produce an even surface on the upper and lower beds of the brick, by working off the superfluous clay. Sand is used to part the wet clay from the mold and the table on which it rests.

Although hand-made bricks are still very common, yet machinery is now always employed when large quantities are required. Brick-making machines are of two leading kinds ; one class of them being constructed to work the clay in a wet plastic state, the other class requiring it to be in a semi-dry condition. Of the two sorts, the wet

clay machines are the simpler, cheaper, and can be worked by less-skilled workmen. On the other hand, the dry-clay machines, which make the bricks by forcing the clay into molds by strong pressure, shorten the process, as no time is required for drying them. The bricks so made, too, are not only of a more perfect shape, but they can be molded into any form, and may even be made highly ornamental at a very slight additional cost.

As might be expected, both the dry and the wet-clay machines of different makers vary considerably in their details. The general plan on which most of the wet-clay machines work is as follows: The machine is driven by steam, and the clay is fed by a hopper into a pug-mill, on the central shaft of which strong pugging blades are placed in a spiral manner. These prepare and force the clay out at the bottom, whence it passes over the carrying rollers to the pressing rollers, which force it through a die in a rectangular stream, so exactly shaped to the required size that nothing more is necessary than to cut it into single bricks by wires. These are set in a rocking frame, which can be so adjusted as to cut the bricks on the square or at an angle; the one plan being adopted when the clay is at rest, the other while it is in motion. When double-ended, the clay is forced out at opposite sides of the pugging cylinder, and there is then, of course, a cutting-table at either side, instead of only one. Some of these machines are provided with a pair of powerful crushing rollers, which reduce any hard lumps or stones before the clay enters the pug-mill.

The green bricks, after being carefully dried, either in the sun or by artificial heat, are usually baked in a kiln with a suitable arrangement of fires and flues. Kilns are of many forms, and the time required for firing in them varies from 40 to 60 hours for common red and white bricks, while for some fire-bricks 150 hours are necessary. Where kilns are not used, bricks are burned in clamps, the clay requiring to be mixed up, in the process of tempering, with a quantity of ground coal sufficient to burn them. A good test of the character of a clay is obtained by the result of firing. The average contraction in the kiln for prepared clays is $7\frac{1}{2}$ per cent. If a brick contracts much more than this, the clay is too fusible; if less, then it is likely to be of an open porous body, which retains its shape well during the firing process.

All brick clays contain iron, and the color of a burned brick almost entirely depends on the amount of it which is present; thus clays containing less than 1 or $1\frac{1}{2}$ per cent of iron, change in the kiln to various shades of cream color and buff, whilst those containing more than 2 per cent, range in color from yellowish-fawn to dark red. Blue bricks are made from the same clay as the red, by controlling in a peculiar way the supply of air in firing, and by carrying the heat slightly further.

Much attention has been paid of late years to the manufacture of fine bricks and terra cotta, which is only another name for ornamental bricks of various shapes, or architectural enrichments of the same material. The effect of some of the public buildings recently erected in Boston and elsewhere, in which terra cotta has been used, is really beautiful. Although it cannot be said to equal sandstone in appearance, it has yet the advantage of giving a much greater variety of color, and is infinitely better and more enduring than a facing of stucco or cement.

Bricks are now made in the United States in nearly the same manner as in England. The size varies in various sections from $7\frac{1}{2}$ to $8\frac{1}{2}$ in. long, 4 to $4\frac{1}{2}$ wide, and 2 to $2\frac{1}{2}$ thick, and is therefore smaller than that of English bricks, which are usually 9 by $4\frac{1}{2}$ and $2\frac{1}{2}$. Philadelphia pressed bricks are in great demand for outer or front walls in consequence of their perfection. Immense quantities of bricks are made at Haverstraw and other places on the Hudson river. Excellent fire-brick are made at South Amboy, N. J.; at Athens, on the Hudson; at Chicago, Peoria, and other places. Milwaukee bricks have a pleasing yellowish cream color; and these, with others variously colored in the manufacture, find much favor for outer walls. Bricks stand fire better than stone. See ADOBE.

BRICKLAYING—BRICKWORK. The material of which a town is built depends mainly on the geology of the surrounding district. In a mountainous country like Scotland, cities of stone, such as Edinburgh, Glasgow, and Aberdeen, naturally abound; while London and most of the great towns of England, situated in alluvial valleys and plains, are built of bricks derived from the alluvial clay beneath and around them. In Holland, where the whole country is but the delta of the Rhine, and no stone is to be found, brick is universal, even to the paving of the streets.

The standard size of English bricks being 9 in. by $4\frac{1}{2}$, the thickness of walls is regulated thereby. They are either half-brick, 1 brick, $1\frac{1}{2}$, 2, 3, or 4 bricks in thickness. In moderate-sized modern English houses, the inside partition-walls are usually half-brick, the outer walls, 1 or $1\frac{1}{2}$. In larger houses of superior construction, a thickness of two or three bricks is sometimes used. This latter thickness is seldom exceeded, except in large public works. Modern brick-houses are, for the most part, far less substantial than those erected by our forefathers. Building leases being usually granted for ninety-nine years, at the expiration of which term, the whole property reverts to the freeholder, the object of the builder is merely to make a house that shall stand for that period, and not to expend any money for the sake of further stability. Garden-walls are commonly built but half-brick in thickness; these, however, are strengthened by 9-in. piers at intervals of 10 or 12 feet. In laying the foundations of walls, the first courses

should be thicker than the intended superstructure, and the projections thus formed, usually of quarter brick on each side, are called "set-offs." Before laying walls of houses, trenches are dug, and the foundation tried with a crowbar or rammer. If it is found to be loose, and the looseness due to superficial soil, this is removed, and its place supplied with fragments of stone and old broken bricks, which are closely rammed together. In some cases inverted arches of brick are built for foundation, or a stratum of concrete laid down. See CONCRETE.

Mortar composed of lime and sand is the common cement for brickwork. It should be equally and carefully applied; and the bricks wetted, in order that the mortar may adhere more firmly, by being absorbed into their pores. The force with which good mortar is capable of adhering to bricks is very remarkable. It is found to be the greatest in old structures that have been exposed to the continuous action of water. Such B. is said to be "water-bound" by workmen, and can scarcely be separated without breaking the bricks.

A fundamental principle to be rigidly observed in laying all kinds of brick is, that *no two contiguous perpendicular joints shall fall immediately below each other*, or, to use the bricklayer's phrase, the work must "break bond." The mode of arrangement of the bricks to effect this is called the *bond*; a layer or stratum of bricks is called a *course*. Bricks laid with their lengths in the direction of the course, and their sides to the wall-face, are called *stretchers*; those laid across the line of the course, with their ends forming the wall-face, *headers*; a layer of headers; a *heading course*, of stretchers, a *stretching course*.

In constructing arches of brick-work, much care and skill are required. A wooden centering is always used; and when very rude work only is required, common bricks are laid upon the centering, and the gaping interstices at the upper ends filled with rough brick wedges. For better work, each brick has to be properly beveled, according to the curve. When semicircular arches are made, all the bricks require an equal bevel, and therefore bricks molded uniformly to the required angle may be used; but for other curves and for flat arches, each brick has to be separately shaped by the brick-layer. In order to do this, a drawing of the required arch is made of the full size on a board; the bricks are laid upon this side by side, and shaped to the lines of the drawing; they are then transferred to their corresponding place in the structure. The bricks are first rudely shaped by the *brick-axe*, then finished on the *rubbing-stone*, a piece of rough-grained stone about 20 in. in diameter. In all kinds of B., the walls should be built up level throughout, in order that the *settlement* may be equal. An unequal settlement may produce a rupture of the wall.

B. is measured by the rod or by thousand. A rod contains 272 sq. ft. of standard thickness—that is, $1\frac{1}{2}$ brick. This is equal to 306 cubic ft., and will, on an average, require 4500 bricks, allowing for waste. The weight of a rod of B. containing 4500 bricks, 27 bushels of lime, and 3 single loads of sand, is about 13 tons. The bricklayer is always attended by a laborer or hodman, who carries his bricks and mortar in a "hod"—a triangular wooden box, open at the top and one end, and supported on a round leg, by which the hodman holds it on his shoulder. A bricklayer's wages are considerable higher than those of the hodman.

The surface of brick-work is sometimes ornamented by *pointing*. This is done by raking out the mortar of the joints to a small depth, and filling up again with blue mortar, and marking the courses with the edge of the trowel. This is called *flat-joint pointing*. When the courses are marked by a neatly pared raised line of white plaster of about half an inch in thickness, laid upon the blue mortar, it is called *tuck* or *tuck-joint pointing*. Colored bricks, as a means of external ornament, have been extensively and most effectively used in n. Italy and Germany.

BRICOLLE. See BALISTA.

BRIDE—BRIDAL. The word bride (the radical signification of which is thought by some to be "appropriated," "owned") is common to all the Gothic languages, and also to Welsh (Ger. *braut*, Welsh *pryd*), and signifies betrothed or newly married. Alone, the word denotes the newly married woman; with the addition of the syllable *groom* (a corruption of *guma* = Lat. *homo*, a man), it denotes the newly married man (Ang. Sax. *brydguma*, Ger. *bräutigam*). In Welsh, *pryd-fab* (betrothed youth) is bridegroom, and *pryd-ferch* (betrothed maid) is bride. Bride is the root of a variety of terms connected with marriage, as bride-favors, bride-cake, etc. Bridal is for *bride-ale* (Ang. Sax. *bryde-eale*), the marriage-feast. Bridemaids, or attendants on brides, appear to have been in use among the Anglo-Saxons, and are mentioned in early accounts of marriage ceremonies. A part of their duty consisted in dressing and undressing the bride. Bridemaids, as mere ceremonious attendants at marriages, are still in use in England. The husband had an analogous body of attendants, called bridegroom-men; but they have disappeared in modern usage, and their only representative is one confidential friend in attendance. In Scotland, this personage is called the best man. One of his duties is to pull off the bridegroom's right-hand glove, while one of the bridemaids does the same service for the bride, when the pair are requested to join hands.

BRIDE-FAVORS are small knots of white ribbons, which are pinned to the breasts of all who are in attendance at weddings, nor are even the postboys and their horses' heads left undecorated with these gay trappings. The origin of the bride-favor is said to be the true-lovers'-knot—something symbolical of the union of hearts and hands on the

occasion. In various old plays and poems there are allusions to bride-favors or ribbons, as that in Herrick's *Hesperides*:

What posies for our wedding-rings,
What gloves we'll give and ribbonings.

The **BRIDE-CAKE** is also symbolical in its origin. "The ceremony used at the solemnization of marriage among the Romans was called *confarreatio*, in token of a most firm conjunction between the man and wife, with a cake of wheat or barley. This, Blount tells us, is still retained in part with us, by that which is called the bride-cake used at weddings."—Brand's *Popular Antiquities*. The old English and also Scottish custom of breaking a cake over the head of the bride on entering her new dwelling, perhaps points to a usage of the most remote antiquity—the sprinkling with wheat as a token of plenty. In modern times, the bride-cake is a stately piece of confectionary, consisting of a rich cake as a basis, on which is reared a castellated structure, with various fanciful devices, the whole being covered with a preparation of white sugar. This fabric is cut up and given in pieces to the guests, as part of the wedding jovialty.

BRIDE, St. See **BRIDGET**.

BRIDE'WELL, a well between Fleet street and the Thames, dedicated to St. Bride, which has given its name to a palace, parish, and house of correction. A palace, described as "a stately and beautiful house," was built here, in 1522, by Henry VIII., for the reception and accommodation of the emperor Charles V. and his retinue; and king Henry himself also often lodged here, as, for instance, in 1525, when a parliament was held in Blackfriars; and in 1529, the same regal personage and his queen, Catharine, lived in the B. while the question of their marriage was argued. In 1553, Edward VI. gave it over to the city of London, to be used as a workhouse for the poor, and a house of correction "for the strumpet and idle person, for the rioter that consumeth all, and for the vagabond that will abide in no place." Queen Mary having confirmed the gift, it was formally taken possession of in 1555 by the lord mayor and corporation. The B. was afterwards used for other persons than the class above named, and at last became a place of punishment, till its removal in 1864.

By the 15 and 16 Vict. c. 70 a new house of correction was established for the city of London. See **CORRECTION**, **HOUSE OF**.

BRIDGE (Ang.-Sax. *brycg*; Dutch, *brug*; Ger. *brücke*) is a structure for carrying a road over a stream, river, ravine, low ground, or other impediment to its course. A bridge for carrying a canal or other water-course, is called an aqueduct (q.v.); one for carrying a railway is sometimes called by the recently coined, though not very correct, word *viaduct* (q.v.). Bridges are formed of stone, brick, cast-iron, or timber arches; of timber beams or frame-work, supported on piles or on masonry; of iron cables or chains, in which case they are called suspension-bridges; of lattice-work; or of cast or wrought-iron girders. Sometimes a combination of beams and suspension-rods is used. Tubular or hollow wrought-iron girders have been occasionally employed, the first great example being the Britannia bridge (q.v.).

Bridges are either fixed or movable. Of movable bridges there are various kinds. *Flying-bridges* and *floating-bridges* are, in fact, mere ferry-boats (see **FERRY**) with gangways attached, and other provisions for safe and ready transport, and which are drawn across the stream by ropes. *Draw-bridges* and *swing-bridges* are constructed in two parts, that turn on pivots—in the former, the parts are lifted vertically; in the other, they are moved round horizontally. A *sliding-bridge* runs backward and forward on wheels or rollers. Another kind is much in use in low districts in England, where the water flows lazily, and almost on the land-level. These are sometimes called pontoon bridges, from the movable roadway being balanced at a small height above the water-level on a pivot working in a large pontoon or hollow cylinder sunk in the bed of the river—the ends of the roadway of the B., when laid across the river, resting freely on piers on either side. There are several such bridges in use over the Ouse. The pivot is set in the center of the stream, and, when necessary, the B. is turned round on it by machinery, till it lies parallel to the banks, and permits the passage of barges on either side. In a flat district, these bridges are exceedingly appropriate. See also **BRIDGE, MILITARY**.

Convenience must have led men in a very rude state of society to form bridges, in order to the easier communication between districts separated by rivers. On most streams there occur fords, but often these are not to be found where they would be most desirable. The most rudimentary form of a B. may be assumed to be a series of stepping-stones, such as are yet almost everywhere to be found on river-courses at some point. Large stones deposited in the streams at the shallows or fords, would first give a chance to a passenger of getting across dry shod; by and by, where one or two stones were wanting to complete the steps in the passage, they would be supplied. Next, it would naturally occur to give greater security to the passage, by laying planks or trees across the stepping-stones, so as to avoid the risks attending stepping or leaping from the one to the other. In the arrangement of planks resting thus on stones, we have the first advance in the art of bridge building, the suggestion at once both of piers and roadways; and beyond this stage, the art would appear not to have advanced for a very long period. From the Greeks, we have accounts of bridges built by Semiramis,

Darius, Xerxes, and Pyrrhus; and in Egypt, necessity early compelled the formation of bridges in connection with the canals constructed for the purpose of irrigation. But all these would appear to have been rudimentary in form, and to have consisted simply of piers, with the intervals between them spanned by beams of timber or large flat stones. Sometimes boats moored in the stream served the purpose of piers, as was the case with the famous B. of Xerxes across the Hellespont. Bridges of boats are in use to this day. The principle of the arch was long known before it was applied to the art of bridge-building. See ARCH. That application we owe to the Romans, whose first great work in which the arch was employed, the Cloaca Maxima (q.v.), is referable to the time of the Tarquins. The Ponte de Rotto, or Senators' B. (127 B.C.), erected by Caius Flavius, appears to have been the first instance of its application to bridges. In the course of the great engineering undertaking of the Roman empire under Augustus Cæsar for the formation of roads and supply of water to Rome, its application became general; and afterwards, the empire having extended its bounds, the necessity for ready communication between its provinces, led to the erection of numerous splendid bridges therein, many of which, indeed, surpassed in their greatness those of Rome itself. But although the Romans have unquestionably the merit of having originated the art of bridge-building proper in Europe, yet it seems doubtful whether the principle of the arch was not applied by eastern nations to bridge-building long before the dawn of the greatness of the Roman empire. The Chinese are said to have been before the west in this as in other arts, though the antiquity of some of the bridges on which this assertion is rested may well be doubted, considering the uncertainty which pervades the chronology of that extraordinary people.

It is impossible here to trace in detail the progress of the art. For a long time after the decay of the Roman empire, it made no progress. It revived in the 11th c., but again languished to the beginning of the 18th, when the formation of the corps of the Ponts et Chaussées in France favored its further growth. Henceforth, many splendid bridges were erected both in Britain and the continent. In 1775, Mr. Pritchard of Shrewsbury, introducing the use of cast iron in the erection of bridges, originated a valuable style of construction. The genius and works of Telford bring us to the present time. Within half a century, the use of steam, the development of the canal system, and the necessity especially for railway-bridges, with the immense amount of capital at the disposal of engineers for purposes of bridge-building, have caused a rapid evolution of all the principles and possible modes of the art. Among the new forms called forth within the century by the increasing demand for facilities of communication, are the suspension B., the wrought-iron girder and tubular bridges, and the lattice-bridges. Several of the new bridges over the Thames are models of engineering skill and taste. The Menai and Britannia bridges were regarded when erected as perfect marvels of the art, and yet they have since been surpassed. In America, the B. of Trenton, over the Delaware, the great Portage viaduct, and the Niagara suspension B., are equal to any similar works in the world. The Tay B., opened in May, 1878, is the longest (2 m. in length) and perhaps the greatest achievement of modern engineering skill. The variety of complex structures of wood and of iron that now span streams and hollows is endless. For some of the more important forms, see FRAME, LATTICE, TUBULAR, and SUSPENSION BRIDGES. What follows here, relates chiefly to arched or masonry bridges, and is confined to the more general and obvious conditions which such bridges must fulfill, avoiding the mechanical theory of their stability as too abstruse for popular exposition.

An arched B. rests between masses of masonry on opposite sides of a river, called its *abutments* (q.v.). The intermediate points of support of the arches are the piers (q.v.), which are rarely built so strong as to be able of themselves to resist the lateral thrust of the arches resting on them, if the thrust of one arch did not counteract that of another. The arch itself is the curved construction between adjacent piers. The chief terms used in speaking of the arch itself are explained under ARCH. In addition, may be noticed the *spandril*, the name given to the filling in above the extrados to the roadway. The *chord* or *span* is the distance between the piers; while the *rise* of the arch is the perpendicular distance between the level of the springing and the horizontal through the key.

When a B. has to be erected, the question of what form it should be, falls to be settled by a variety of considerations. Regard to appearance affects the question, but the material points are its sufficiency for the purposes for which it is intended, and its security and durability. The nature of the embankments and of the soil in the water-bed, together with the nature of the water-shed, or country drained by the stream, may make it necessary that the B. should not be an arched bridge at all, but a suspension or cantilever bridge. But if it is to be an arched B., then the most important questions respect the number of its piers and the form of its arches. If vessels must be free to pass under it, the arches must be lofty, and the abutments high; so also must they be if the river is exposed to sudden elevations of its level by floods. Formerly a prejudice existed against laying a B. across a stream at any other angle than at right angles to its course. The reason was that the theory of the skewed arch (q.v.) being unknown, the obliquity of the B. to the water-course involved a corresponding obliquity of its piers to the water, which greatly increased the risk of the B. suffering from floods. But the skewed arch allows a B. to be thrown at any angle across a river, with its piers all parallel to the

stream; and many an awkward turn in our public roads would have been spared us had the skewed arch only been earlier known. See **SKEW BRIDGE**.

After making allowance for the requirements of position and traffic, the form next must be considered, more particularly in relation to the stream. The stream principally affects the form, through prescribing the number of piers. Each pier takes up so much of the water-course, and thus narrows the effective passage of the water. The immediate consequence of narrowing the channel is to increase the velocity of the stream. As the velocity of the stream increases, it tends more and more to carry off the soil in the neighborhood of the piers, and finally, by deepening its course, to undermine them. From this consideration, the effect of too many piers will be obvious; but indeed this is not matter of speculation, for many bridges—among others, a B. of Smeaton's at Hexham—have been destroyed from this cause, thus falling from the very overabundance of support! To know how many piers may with safety be used, the volume of water that flows through the channel, both ordinarily and in winter-floods, must be ascertained, which can be done very nearly by calculating the mean of many soundings taken at different states of the river, and at a succession of points across its bed. There is another way in which the stream affects the form. If it is liable to floods, care must be taken to make the piers so high as to elevate the spring of the arches above the highest level attainable by the water. In connection with this part of the subject, it must be remembered, too, that floods are apt to carry down trees and other floating masses, which, if the arches do not afford them passage, become powerful levers for the destruction of the bridge.

The form of the B. being determined on, the remaining questions relate to its stability. This depends on the strength of the abutments and piers, and the balanced equilibrium of the arches. The importance of securing proper foundations for the abutments and piers cannot be over-estimated, and very frequently their foundations, owing to the nature of the soil, have to be artificially constructed. See **PILES**, **COFFER-DAM**, and **CONCRETE**. In considering the stability of the B., the first thing is to ascertain the forces which will act to destroy it. This is ascertained by calculating the extreme passing load, and also the weight of the structure above the arches, and of the arches themselves. A scientific and skilled engineer is then able to judge what amount of strain or destructive pressure will be exercised by these weights on the several parts of the structure, and thus to adapt the strength at every point to the strain. As to the passing load, it is usual to calculate on 240 lbs. per foot, superficial, of the whole area in ordinary bridges, and on 960 lbs. in railway bridges. The weight of the superstructure and arches is a question for practical measurement. As to the remaining pressure—viz., that of the stream—it must be ascertained for the highest floods. It is calculated from knowing the mean velocity of the stream, and the amount of surface exposed to it. The surface is readily observed by means of floats; and when this is under 10 ft. per second, the mean velocity is found to be about one fifth less. The stress of the stream on the bridge is diminished by the expedient known as a cut-water, which is an angular projection from the pier. The best form for a cut-water has practically been ascertained to be an equilateral prism, presenting an angle of 60° to the water-course. In all bridges these are to be found on the sides of the piers presented to the stream; and in tidal rivers, they are built on the lower side as well.

After the conditions already mentioned are satisfied, taste has more to do with the form of the arches than anything else. The forms in use are the old semicircular, the elliptical—usually got at by putting together several circular arches of different radii—and the segmental arch. The semicircular arch was almost exclusively used in the more ancient bridges. This arch is the most solid and most easily constructed, as all the voussoirs may be worked from the same mold. It requires, however, high banking, as its height is equal half its breadth; and where the water-level greatly changes, it is particularly unsuitable, from the great height necessary to be given to the piers, to carry the intrados out of water-reach. The elliptical arch and the segmental of 60° are, besides, far more pleasing in appearance.

In possible extent of span, the masonic bridge is far exceeded by suspension and girder bridges. At Chester there is a stone arch with a span of 200 ft.; in the Britannia tubular bridge the span is 460 ft.; in the suspension bridge over the Menai strait, 600 ft.; and in the suspension bridge at Freiburg, Switzerland, 870 feet. The railway bridge across the Tay, near Dundee, partially destroyed in 1879, was 3450 yards long. See **TUBULAR BRIDGE** and **SUSPENSION BRIDGES**: **CANTILEVER BRIDGE**.

The principal objections to the wooden B. is its liability to fire and to decay, besides which it is liable to warping, through the swelling and contracting of its beams. Although iron is fast superseding wood for bridge construction, a large proportion of American bridges is still to be found of the latter material. Wooden bridges are now assumed to have a life of but about 10 years.

English bridges are maintainable at the expense of the counties in which they are situated; but in many cities and boroughs, the inhabitants have acquired by prescription a liability for this expense, and by the 13 and 14 Vict. c. 64, the management and control of such bridges is given to the council of the city or borough. If part of a public bridge be within one county or other place on which the liability rests, and the other part of the bridge be within another, each party or body shall repair that part of the bridge which

is within its own boundaries. Besides the bridge itself, the county liable is bound by the 22 Henry VIII. c. 5, to repair 300 ft. of the road either way from the bridge. And such is still the state of the law as to all bridges built prior to the passing of the highway act, 5 and 6 Will. IV. c. 50. But by that act it is provided that, in the case of all bridges thereafter to be built, the repair of the road itself passing over or adjoining to a bridge, shall be done by the parish, or other parties bound to the general repair of the highway of which it forms a portion—the county being still subject, however, to its former obligation as regards “the walls, banks, or fences of the raised causeways, and raised approaches to any bridge, or the land arches thereof.” See Stephen’s *Com.*, vol. iii. p. 234. The neglect to make such repairs is treated in law books as a kind of negative offense; but there are positive offenses against bridges, which in the statutes are called nuisances, as to which, see the 43 Geo. III. c. 59. An act to amend the law in regard to the maintenance and management of roads and bridges in Scotland was passed in 1878, entitled “Roads and Bridges act.” Private bridges are those erected and maintained under contracts authorized by private acts of parliament.

We have already mentioned in the former part of this article some of the older American bridges. It remains now to describe the most important American bridge as regards construction—that over the East river between the cities of New York and Brooklyn, commonly known as the “Brooklyn Bridge.” The land approaches are of stone and brick in arches and piers, terminating at the river in the grand stone piers that rise 278 ft. above high-water. The following official account of dimensions and weight of materials is given: construction commenced Jan. 2, 1870; size of New York caisson, 172×102 ft.; size of Brooklyn caisson, 168×102 ft.; timber and iron in caisson, 5253 cubic yards; concrete in well-holes, chambers, etc., 5669 cubic ft.; weight of New York caisson, about 7000 tons; weight of concrete filling, about 8000 tons; New York tower contains 46,945 cubic yards of masonry; Brooklyn tower contains 38,214 cubic yards of masonry; length of river span 1595 ft. 6 in.; length of each land span, 930 ft.—1860 ft.; length of Brooklyn approach, 971 ft.; length of New York approach, 1562 ft. 6 in.; total length of bridge, 5989 ft., or 1.134 m.; width of bridge, 85 ft.; number of cables, 4; diameter of each cable, 15½ in.; first wire was run out May 20, 1877; cable-making really commenced June 11, 1877; length of each single wire in cables, 3578 ft. 6 in.; ultimate strength of each cable, 12,200 tons; weight of wire, 12 ft. per lb.; each cable contains 5296 parallel (not twisted) galvanized steel, oil-coated wires, closely wrapped to a solid cylinder 15½ in. in diameter; depth of Brooklyn tower foundation below high-water, 45 ft.; depth of New York tower foundation below high-water, 78 ft.; size of towers at high-water line, 140×59 ft.; size of towers at roof course, 136×53 ft.; total height of towers above high-water, 277 ft.; clear height of bridge in center of river span above high-water, at 90° Fah., 135 ft.; height of floor at towers above high-water, 119 ft. 3 in.; grade of roadway, 3¼ ft. in 100 ft.; height of towers above roadway, 159 ft.; size of anchorages at base, 129×119 ft.; size of anchorages at top, 117×104 ft.; height of anchorages, 88 ft. front and 85 ft. rear; weight of each anchor plate, 23 tons; total cost of bridge, exclusive of land, \$14,627,379; total weight of suspended structure, 17,780 tons. Engineer, W. A. Roebling. The bridge was opened, '83. 45,000 persons can cross hourly, supposing each to move at the rate of 200 ft. per minute, and 1440 vehicles.

Some other American bridges may be briefly described. One of the earliest of note is that over the Schuylkill at Philadelphia, which Fanny Kemble poetically described as “a scarf rounded by the wind and thrown over the river.” It was accidentally burned in 1838. The railroad bridge at Bellows Falls, built in 1850, has a span of 250 feet. The Susquehanna bridge (of the Wilmington and Baltimore railroad) is 3500 ft. long, with 13 piers and 2 guard piers at the draw. The spans are 250 ft. long, and the draw-span 176 feet. The Niagara Suspension Bridge has a span from center to center of towers of 821 ft., and is 245 ft. above the river. The bridge (suspension) over the Ohio between Cincinnati and Covington has a span of 1067 ft., and is 91 ft. above low-water. The Clifton bridge (over Niagara river just below the falls and above the suspension bridge) is 1190 ft. from bank to bank, and 1268 ft. between the points of suspension on the towers, and is 193 ft. above the water. The Victoria tubular bridge over the St. Lawrence at Montreal has a length of tube of 6600 ft., carried over 24 openings of 240 ft. each, and one of 330 ft.; with the approaches this bridge is 9084 ft. long. The Quincy Bridge over the Mississippi (draw) has 17 spans, two of 250 ft., three of 200, 11 of 137, and a draw-span of 360 feet. The bridge over the Missouri at Omaha is 2800 ft. long in 11 spans. The bridge of the New York Central railroad over the Hudson at Albany is 1740 ft. long, in 15 spans and a draw. But the most noteworthy of railroad bridges is that over the Mississippi at St. Louis. It is in three immense spans, those at the ends being 502 ft. each, and the middle one 520 feet. Over the railroad floor is a carriage and foot roadway 34 ft. wide between the foot-walks, which are each 8 ft. wide.

The terrible disaster of the fall of the Tay Bridge in Scotland, the centre portion of which went down in a furious gale on the night of the 27th Dec., 1879, justifies a brief description of that structure. It was the largest iron bridge in the world, crossing the river, or arm of the sea, a mile and a quarter w. of Dundee, with a length from shore to shore of 10,320 ft. (only 240 ft. less than two miles). Commencing at the s. or Fife shore there were three spans of 60 ft., two of 80 ft., 22 of 120 ft., 14 of 200 ft., 16 of 120 ft., 25 of 66 ft., one of 160 ft., and six of 27 ft.—in all 89 spans, the rails being 88 ft.

above the water. The portion which fell consisted of 12 spans somewhere near the middle of the bridge. A train of six passenger cars and the brakemen's van either went down with the bridge or ran into the vacancy in the dark, and not one person survived. There were over 90 lives lost.

The following statement comprises a list of the most important railway bridges and viaducts constructed by European and American railway companies. There are stone, wood, and iron structures, all of which appear under a separate head:

Stone Bridges and Viaducts.—Ballochmyle viaduct, Glasgow, and S. W., width of span, 181 ft.; viaduct at Nogent, S. M., near Paris, 164 ft.; Durham Junction viaduct, 160 ft.; bridge near Wolmsdorf, Silesia, 150 ft.; bridge near Maidenhead, built by Brunel, 1835, 129 feet. There are three or four structures to be added to the foregoing, whose widths of openings exceed 100 feet. This includes the bridge at the Point-du-Jour, at Paris; the viaduct near Loebau, in Saxony, and the bridge at Point-de-Pille, on the line between Orleans and Bordeaux. The highest arches are principally found in Germany, and in the second line in various parts of France.

Viaducts of Stone and Brick.—Height of arch; over the Goeltz valley, in Saxony, 256 ft.; over the Elster valley, in Saxony, 223 ft.; over the Riofredo, in Austria, 197 ft.; at Diedenmuhle, near Chemnitz, Saxony, 170 ft.; at Chaumont, Paris to Mulhouse, 164 ft.; at Kalte Rinne, Semmering, Austria, 151 ft.; at Fure, near Grenoble, 135 ft.; at Comelle, near Creil, Paris, 131 ft.; at Wagnergraben, Semmering, Austria, 128 ft.; at Combe-Bouchard, Paris-Lyons railway, 128 feet. In addition to these there are several other bridges and viaducts whose height varies from 100 to 125 feet. Among the principal are: the viaduct over the Tranz valley, in Austria; bridge across the river Fulda, near Kragenhof, Hanover; the Goel viaduct at Aix-la-Chapelle; viaduct at Mireville, on the line between Havre and Rouen; four more are in Saxon Switzerland; the rest in various parts of France. The longest viaducts and bridges are to be found in England; notably the viaduct on the line from London to Greenwich; the system of the South-western, South-eastern, Chatham and Dover, Great Eastern, and of other lines serving the metropolis. The next importance attaches to the bridge spanning the Lagoons and running into Venice, the bridge and viaduct over the river Elbe, at Dresden, and a few others.

Timber-built Bridges and Viaducts.—The most prominent structures are the following: Over the river Mista, on the Moscow and St. Petersburg railway, nine openings, each 200 ft. wide; over the river Elbe, at Wittenberg, with 14 openings, varying in width from 140 to 100 ft.; bridge near Woltenhofen, on the road from Lindau to Augsburg, Bavaria, one opening, 170 ft. wide; bridge near Kempten, on the same line as the foregoing, with five openings, varying in width from 85 to 140 ft. each. There are two wooden bridges on the North Shields, Newcastle line, one with seven, the other with five openings, the widest of which spans about 135 feet. The United States possess wooden bridges in very large numbers, and of much greater dimensions than are found on European roads. Among those noteworthy is the bridge over the Delaware river, on the Erie road, with two openings, each of a width of about 260 feet. The next structure of importance is a bridge over the Susquehanna river, near Columbia, with 29 openings, each about 200 ft. wide. There are two bridges crossing the Connecticut river, with spans of 174 feet. These are the most prominent bridges; but there are numerous other very remarkable structures, which, though of smaller dimensions, give evidence of great engineering skill.

Iron Bridges and Viaducts.—The following list comprises structures of this class of the greatest extent in length:

	Feet.
Parkersburg Bridge, West Virginia.....	7,045
St. Charles Bridge, Missouri.....	6,536
Over the river Ohio, near Louisville, Ky.....	5,310
Over the river Delaware, Pennsylvania.....	4,920
Over the East river, New York.....	5,989
Victoria Bridge, St. Lawrence river, Canada.....	6,600
Over the river Rhine, at Mayence, Germany.....	3,380
Over the river Tongabudda, Bombay, Madras.....	3,730
Over the river Mississippi, near Quincy.....	3,200
Over the river Missouri, near Omaha.....	2,790
Over the river Vistula, near Dirschau, Germany.....	2,750
Over the river Danube, near Stadlau, Austria.....	2,520
Over the river Po, near Mezzano-Corti, Italy.....	2,485
Over the river Tamar, near Saltash.....	2,190
Over the river Lek, near Kuilenburg.....	2,185
Over the river Mississippi, near Dubuque.....	1,758
Over the river Sorai, in British India.....	1,745

The foregoing comprises a list of the longest bridges constructed of iron, but it does not include all the most important works from an engineering point of view. The bridges which have the widest or the most numerous openings are given in the subjoined list, and comprise all the great marvels which engineering skill and ingenuity have produced: Britannia bridge, Menai straits: four openings, two of 230 feet, and two

of 460 feet; built by Robert Stephenson and Fairbank, 1846-50. Conway bridge, Menai straits: one opening, 400 feet; built by Stephenson, 1847-48. Victoria bridge, crossing the St. Lawrence river at Montreal: one opening 330 ft., and 24 openings, each 240 feet; built by Stephenson. Bridge over the Garonne, near Langon, on the Bordeaux-Cette line: one opening of 245 ft., and two each of 210 feet. Over the Aire, near Brotherton: one opening of 225 feet. Over the Trent, near Gainsborough, on the Manchester, Sheffield and Lincoln line: two openings, each 150 ft. wide. Over the river Lek, a branch of the Rhine, near Kuilenburg, Holland: one opening of 150 ft., one of 80 ft., and seven of 57 feet: built 1868-70. Over the river Ohio, near Louisville, U. S.; one opening of 400 ft.; one of 370 ft.; six, each of 236 ft.; 14, varying in width from 210 ft. to 140 ft.; one of 100 ft., and two, each of 50 feet; built in 1868. Over the Vistula, near Dirschau, Berlin-Königsberg line—built 1850-57, by Lentze: six openings, 350 ft. each. Over the Waal, near Lommel, Belgium: three openings of 400 ft. each, and eight of 190 ft. each. Over the Rhine, near Griethausen: one opening of 330 ft., and 20 of 60 ft. each; built in 1863-64, by Monie. Over the Rhine, near Hamin: four openings, each of 330 feet; built in 1868-70, by Pichier. Over the Dieppe, near Moerdyk, Holland: 14 openings, each of 330 ft., and two of 51 feet. This structure resembles in a measure the unfortunate Tay bridge. It was completed in 1871. Over the Rhine, near Cologne: four openings of 320 ft. each; built, 1856-60, by Lohse and Wiedman. Over the Nogat, near Marienburg, Baltic: two openings of 312 ft. each. Over the Wye, near Chepstow: one opening of 300 ft., and three, each of 100 feet; built by Brunel, 1850-52. Over the Rhine, near Mannheim: three openings of 295 feet. Over the Boyne, near Drogheda: one opening of 270 ft., and two each of 140 feet; built by Barton, 1855. Over the Danube canal, near Vienna: one opening 260 ft. wide; built in 1860 by Koestlin. Over the Danube, near Stadlau, Austria: five openings each of 250 ft., and 10 each of 110 feet; built by Ruppert, 1868-70. Over the Trent, near Newark: one opening of 240 feet; built by Fox and Henderson, 1851. Over the Thames, Blackfriars: one opening of 205 ft., two of 195 ft., and two of 170 feet; built 1863-64. Over the Kinzig, near Offenbourg, Germany: one opening of 190 feet. Over the Elpel, Hungary: one opening of 185 ft., and three of 145 feet. Over the Rhine, near Strasburg: three openings of 185 feet. Over the Grau, in Hungary: one opening of 166 ft., and three of 144 ft. each, built by Ruppert, 1858. Over the Saar, near Freiburg; five openings, each of 160 ft., and two of 142 feet. Crumlin Viaduct, Newport-Abergavenny line: 10 openings each of 160 ft. width; built by Liddle and Gordon, 1853. Over the Lahn, near Coblenz: one opening, 150 ft. wide. Over the Thames, near Windsor: one opening of 200 feet; built by Brunel, 1849. Over the Weser, near Corvey, Germany: four openings, each of 185 feet; built by Schwedler, 1863-64. Over the Orne, near Caen, France: one opening of 145 feet. Built by Maier, 1858. On the Blackwall line: one opening, 120 feet. Over the Tamar, at Saltash: two openings of 450 ft., and 17 openings varying from 70 to 90 feet; built by Brunel. Over the Rhine, at Mayence: four openings, each of 335 ft., six of 115 ft., and 22 openings varying in width from 50 to 80 feet. Over the Isar, near Hesseloe, Germany: two openings, each of 170 ft., and two each of 85 feet. Over the Elbe, at Hamburg: seven openings, each of 335 ft., and three openings of 310 feet; built by Lohse, 1870. Over the Yssel, near Zutphen, Holland: one opening of 320 ft., and two of 55 feet. Over the Ohio, near Benwood, United States: one opening of 320 feet. Over the Mersey, near Runcorn, London and North-western railway: three openings of 300 ft. each. Over the Missouri, near Omaha, United States: 11 openings, each of 270 feet; built by Dodge, 1860-61. Over the Danube, near Manthausen, Austria: five openings of 260 ft., and two of 90 feet. Over the Danube, at Vienna, North-western line: four openings of 260 ft., and 14 openings of 95 feet; built by Hellwag and Gerlish, 1870-72.

The railway cantilever bridge over the Forth at Queensferry, completed in the year 1890, is the most remarkable application of the cantilever principle in the world. The breadth of the Forth at Queensferry is rather more than a mile; but, as the viaduct had to be continued overland on the n. shore for several hundred yards, the whole length of the bridge extends about one mile and one third. This, however, gives no fair idea of the breadth of span to which the physical conditions require the suspension principle to be applied. In the midst of the firth, but rather nearer to the northern than to the southern shore, rises the rocky islet of Inchgarvie. On either side of this island the bed of the river sinks to a depth which is impracticable for engineering purposes. On the n. side the bed sinks to a depth of 210 ft., on the s. side to 180 ft., below the water-mark; and it is there, for a breadth of 1600 ft. on either side, that no practicable bottom can be found for piers, and therefore that the suspension principle had perforce to be resorted to. Between the deep furrow on the s. side of Inchgarvie and the southern shore there is a reach of comparatively shallow water, with a maximum depth of 30 ft., but within which foundations may be found for some 12 or 15 piers. Viewed in profile from the bosom of the firth, the bridge thus presents to one's view five distinct sections. First, there is a shallow-water section on the s. side, covering some 2000 ft., and supported on 16 piers; then there is the deep-water section, s. of Inchgarvie, traversed by a suspension bridge; next there is the island of Inchgarvie itself, over which the viaduct was carried on two or three piers; then there is the deep-water, section n. of Inchgarvie, spanned by a second suspension bridge; and, lastly, there is the northern shoreward section, which carries the

viaduct on 10 or 11 piers from the brink of the tide to the dead level of the Fife shore. The great features of the architectural design, as seen from the firth, are now the four pairs of lofty towers on which the massive steel chains which firmly support the two suspension bridges are hung, and next the two pairs of landward buttresses to which the suspending chains were anchored. Of the towers, two pairs now rise from the island of Inchgarvie, and attain the imposing height of 596 ft. Two pairs on the shore of n. Queensferry, and other two on the brink of deep water on the southern channel, attain to a full height of 584 feet. The two pairs of buttresses on the n. and the s. side respectively are, of course, less lofty; but they are also bold and striking masses of masonry. Those parts of the bridge, n. and s., which rest on piers, with a solid foundation bed consist of a single permanent way 25 ft. broad, and carrying a double set of rails. But the intervening portions carried by the suspension bridges consist of two distinct and parallel branches, each 15 ft. broad, each carrying a single line of rails, and 100 ft. apart. These branches are very tightly braced together; and this arrangement has been adopted in order to give greater breadth, and therefore greater stability, to the whole structure. Seen from above, the outline of the design has the appearance of a shuttle with elongated points. The divergence of the branches begins at the massive piers, two on each side, to which the suspension chains are anchored, and the maximum of divergence, 100 ft., was thus attained before the lofty towers were reached. While the bridge throughout the greater part of its extent makes necessarily a straight course, the shoreward part at either end forms a gentle curve. From each shore to the beginning of the suspension bridge the line rises with a gradient of 1 in 100. In the shoreward sections, and in that over Inchgarvie, the permanent way rests on the upper members of the lattice-girders; but in the two suspension sections it rests on the lower members. By this contrivance here, as in the case of the Tay bridge, the full height of 150 ft. above the high-water mark is confined to the central sections only. It will be evident that each of the deep-water channels n. and s. of the island of Inchgarvie has been spanned by a double suspension bridge. Each of these double bridges now consists of four parallel and enormous lattice-girders—two for each branch. These girders are 1600 ft. long. Seen in profile, their upper members form an arched outline, with a maximum height of 50 ft. and a minimum of 19 ft. besides the towers. On these towers, of course, their ends rest; but they derive their main support from four immense steel chains, one for each girder, which have been slung over the towers and fastened to the anchoring piers at either end. The girders are attached to the chains by stout wrought-iron rods at intervals of 50 ft. See adjoining illus.; also *ENGINEERING*, vol. V., and *RAILWAYS*.

BRIDGE, MILITARY, is a temporary construction, to facilitate the passage of rivers by troops, cannon, and military wagons. The most efficient are described under *Pontoon*; but there are many other kinds. A *bridge of boats* is formed by small-craft, especially cargo-boats, collected from various places up and down the river; trestles are placed in them to bring their tops to one common level; the boats are anchored across the river, and baulks of timber, resting on the trestles, form a continuous road from boat to boat across the whole breadth of the river; the boats ought to be of such size that, when fully laden, the gunwales or upper edges shall not be less than one foot above the water. *Rope-bridges* are sometimes but not frequently used by military engineers. A *boat-and-rope bridge* consists of cables resting on boats, and supporting a platform or road of stout timber. A *cask-bridge* consists of a series of timber-rafts resting on casks; the casks are grouped together in quadrangular masses; at certain intervals, timbers are laid upon them to form rafts, and several such rafts form a bridge; it is an inferior kind of pontoon-bridge. A *trestle-bridge* is sometimes made for crossing a small stream in a hilly country; it consists of trestles hastily made up in any rough materials that may be at hand, with planking or fascines to form a flooring, cables to keep the trestles in a straight line, and heavy stones to prevent them from floating. *Raft-bridges*, consisting of planks lashed together, are easily made of any rough materials that may be found on the spot; but they have little buoyancy, and are not very manageable. A *swing-flying bridge* consists of a bridge of boats, of which one end is moored in the center of the river, and the other end left loose; this loose end is brought to the proper side of the river, the boats are laden, and they make a semicircular sweep across the river by means of rudders and oars, until the loose end of the bridge reaches the other bank. A *trail-flying bridge* is a boat or raft, or a string of boats or rafts, which is drawn across a river by ropes, in a line marked out and limited by other ropes.

BRIDGE, NATURAL. See *NATURAL BRIDGE*.

BRIDGE-BUILDING BROTHERHOODS (Fr. *Frères pontifes*; Lat. *Fratres pontifices*) were religious societies that originated in the s. of France in the latter half of the 12th century. Their purpose was to establish hospices at the most frequented fords of large rivers, to keep up ferries, and to build bridges. The church during the middle ages regarded the making of streets and bridges as meritorious religious service. Whether or not the herdsman Benezet, subsequently canonized, was the founder or only a member of this fraternity, is as uncertain as the tradition which attributes to him the completion of the bridge over the Rhone at Avignon in 1180. The fraternity was sanctioned by pope Clemens III. in 1189; its internal organization was similar to that of the knightly

orders, and the members wore as their badge or insignia a pick-hammer on the breast. In France they labored very actively, but were absorbed into the order of St. John.

BRIDGE-HEAD, or **TÊTE-DU-PONT**, in military engineering, is a fortified post intended to defend the passage of a river over a bridge. It is a field-work, open at the gorge or in the rear, and having its two flanks on the banks of the river. The most favorable position is at a re-entering sinuosity of the river, where the guns can work better with the supporting batteries opposite. Bridge-heads are usually temporary works, hastily constructed. Their most frequent use is to aid a retiring army to cross the river in good order, and to check an enemy pressing upon it. Openings are left to allow the retiring army, with guns and carriages, to file through without confusion; and parapets are so disposed as to flank and defend these openings. See *illus.*, **FORTIFICATION**, vol. VI., fig. 48.

BRIDGENORTH, a t. of Salop or Shropshire, on both sides of the Severn, 20 m. s.e. of Shrewsbury. It consists of an upper and lower town, connected by a bridge over the Severn, which divides into two parts, known as the New Town and the High Town, of which the latter is on the right bank, and is built on a sandstone rock rising 60 ft. above the river. Pop. '91, 5723. It sent two members to parliament till 1868, and one member till 1885. The town, which was at one time called *Bruges* or *Brug*, is said to be of Saxon origin. In the beginning of the 12th c., Robert de Belesme defended the town unsuccessfully against Henry I. It was besieged in the same century by Henry II.; and during the civil wars it resisted the parliamentary forces for three weeks. A great portion of the town was on this occasion destroyed by fire. It has tanning, carpet and worsted industries, and a trade in agricultural produce. Bishop Percy was born here.

BRIDGE OF SIGHS, the covered passage which connects the doge's palace in Venice with the prison, over which prisoners of state were taken to confinement or to execution.

BRIDGEPORT, city, port of entry, and one of the seats of Fairfield co., Conn., on Bridgeport Harbor, an inlet of Long Island Sound, at the mouth of the Pequonnock River, 18 miles southwest of New Haven, 56 miles northeast of New York; lat. 41° 10' n.; long., 73° 11' w. The first settlement was made in 1670, and as Fairfield Village, Stratfield and Newfield successively, Bridgeport formed part of Fairfield, and in 1800 became the borough of Bridgeport; but was attached to Stratford until 1821. It was incorporated as a city in 1836, and in 1870 a part of Fairfield was annexed. West Stratford is practically a part of Bridgeport. The city is built mainly on level ground, and covers an area of 15 square miles. The most beautiful section, Golden Hill, has an elevation of 70 feet, affording fine views, and is covered with beautiful residences. The principal public buildings are the United States Post Office and Custom House, the Fairfield County Court House, the Barnum Memorial Institute, bequeathed to the Scientific and Historical Societies, and the Young Men's Christian Association Building. Bridgeport contains a well-endowed public library, an Historical Society, and a Scientific Society, which has an interesting collection of Indian relics. There are three fine parks. The most beautiful is Seaside Park, 100 acres in extent, situated on the shore, with a sea wall and drive two miles in length. It contains a Soldiers' Monument, and a statue of Elias Howe. The winter quarters of Barnum and Bailey's Circus occupy twelve acres. Bridgeport has numerous churches, several national banks, hospitals, an Orphan Asylum and Widows' Home, and daily, weekly, and monthly periodicals. There are high, graded, and training schools, and several private institutes. The city is supplied with water from the Pequonnock River, and is lighted by electricity. Black Rock, which forms part of Bridgeport, is a summer resort, and its harbor is a favorite one with yachtsmen. Bridgeport Harbor, including that of Black Rock, is landlocked and safe, and the channel is from nine to ten feet deep at low tide. Steamboats run daily to New York.

Bridgeport is an important manufacturing city. In 1890 there were 559 establishments, with an aggregate capital of \$19,786,572, employing 13,136 persons, and the value of the products was \$22,274,635. The principal articles manufactured are sewing-machines, carriages, brass, iron, copper, and steel goods, machinery, cartridges and plated ware. Some of the manufactories are of vast size. The Wheeler and Wilson Sewing Machine Works cover ten acres and the Union Metallic Cartridge Company has the largest establishment in its line in the world. The assessed value of property in 1895 was \$57,094,379. The population in 1810 was 1089; 1860, 13,299; 1870 (when a part of Fairfield was annexed), 18,969; 1880, 27,643; 1890, 48,866.

BRIDGER'S PASS, a defile in the Rocky mountains, in s. Wyoming, through which the overland stages went before the opening of the Pacific railroad. It is several miles long, and in most places has perpendicular side walls from 1000 to 2500 ft. high.

BRIDGET, SAINT (or, more properly, *Birgit* or *Brigitte*), a famous Roman Catholic saint, was b. in Sweden about the year 1302. Her father was a prince of the blood-royal of Sweden. When only sixteen, she married Ulf Gudmarson, prince of Nericia, a stripling of eighteen, by whom she had eight children, the youngest of whom, named Catherine (born in 1336, died in 1381), became *par excellence* the female saint of Sweden. Her husband and she now solemnly vowed to spend the remainder of their lives in a state of continence, and, to obtain strength to carry out their severe resolution, made a pilgrimage to the shrine of St. Jago de Compostella in Spain. On their return, Ulf died in 1344, and B. founded about the same time the monastery of Wadstena, in East Goth-

land. Sixty nuns and twenty-five monks were its first inmates. They received the rule of St. Augustine, to which St. B. herself added a few particulars. They constituted a new order, sometimes called the order of St. B., sometimes the order of St. Salvator, or the Holy Savior, which flourished in Sweden until the reformation, when it was suppressed, but it still possesses some establishments in Italy, Portugal, and elsewhere. Subsequently, St. B. went to Rome, where she founded a hospice for pilgrims and Swedish students, which was reorganized by Leo X. After having made a pilgrimage to Palestine, she died at Rome on her return, 23d July, 1373. Her bones were carried to Wadstena, and she herself was canonized in 1391 by pope Boniface IX. Her festival is on the 8th of October. The *Revelationes St. Brigittæ*, written by her confessors, was keenly attacked by the celebrated Gerson, but obtained the approval of the council of Basel, and has passed through many editions. Besides the *Revelationes*, there have been attributed to this saint a sermon on the Virgin, and five discourses on the passion of Jesus Christ, preceded by an introduction which was condemned by the congregation of the *Index*.

Not to be confounded with this Swedish saint is another St. Bridget, or St. Bride, as she is more commonly called, a native of Ireland, who flourished in the end of the 5th and beginning of the 6th c., and was renowned for her beauty. To escape the temptations to which this dangerous gift exposed her, as well as the offers of marriage with which she was annoyed, she prayed God to make her ugly. Her prayer was granted; and she retired from the world, founded the monastery of Kildare, and devoted herself to the education of young girls. Her day falls on the 1st of February. She was regarded as one of the three great saints of Ireland, the others being St. Patrick and St. Columba. She was held in great reverence in Scotland, and was regarded by the Douglasses as their tutelary saint.

BRIDGETON, city, port of entry, and co. seat of Cumberland co., N. J.; on the Cohansey River, and the Central of New Jersey and the West Jersey and Seashore railroads; 38 m. s. of Philadelphia. It was settled long before the revolution, but was not incorporated till 1864. Its chief manufactures are glass, gas pipes, nails, castings, machinery, lumber, flour, oil cloth, woolens, and canned fruits and vegetables. Among its educational advantages are the South Jersey Institute, the West Jersey Academy, Ivy Hall Seminary, Seven Gables Seminary, and a public high school. There are Tumbling Dam park of 100 acres, containing Sunset lake and athletic fields; numerous churches; electric lights and street railroads; good water and sewerage services; hotels; national banks; and daily, weekly, and monthly periodicals. The climate is excellent, and the surrounding region is exceedingly fertile and well cultivated. Pop. '90, 11,424.

BRIDGETOWN, the capital of Barbadoes (q.v.), is situated on the w. coast of the island along the n. side of Carlisle bay, which forms its roadstead, in lat. 13° 4' n., and long. 59° 37' w. Pop. 21,000. It was founded about the middle of the 17th c., taking the name Indian Bridge, and later its present appellation, from a rude aboriginal structure which spanned a neighboring creek. The present city, however, is only 130 years old, the former having been almost destroyed by fire in May, 1766. In 1831, a part of B. was destroyed by a hurricane, and in 1845 it again suffered severely from fire. It is the residence of the bishop of Barbadoes and of the governor-general of the Windward islands, and has a college, government buildings, town hall, water works, and jail. There is a considerable trade. A railroad 23 m. in length connects with the parish of St. Andrew.

BRIDGEWATER, a town in Plymouth co., Mass., 27 m. s. of Boston, on the New York, New Haven and Hartford railroad. It contains five villages, the state farm, a state normal school, a state almshouse, cotton mills, iron works, nail and tack mills, boot and shoe factories, brick works, public library, banking facilities, and weekly newspaper. Pop. '90, 4249.

BRIDGEWATER, a t. and port of Somersetshire, on both sides of the Parret (which is here spanned by an iron bridge), 6 m. in a direct line, and 12 by the river, from the Bristol channel, and 30 m. s.w. of Bristol. It stands on the border of a marshy plain, which lies between the Mendip and Quantock hills, but the country around is well wooded. It is chiefly built of brick. St. Mary's church has a remarkably slender and lofty spire. The Parret admits vessels of 200 tons up to the town; it rises 36 ft. at spring-tides, and is subject to a bore or perpendicular advancing wave, 6 or 8 ft. high, often causing much annoyance to shipping. Pop. in 1891, 12,429. B. formerly returned two members to parliament, but was disfranchised in 1870. Bath or scouring bricks, peculiar to B., are made here of a mixture of sand and clay found in the river. Admiral Blake was a native of this town, which suffered severely in the civil wars, when it was besieged by Fairfax, and ultimately forced to surrender, the castle being dismantled by the conqueror. The unfortunate duke of Monmouth was proclaimed king by the corporation of B. before the battle of Sedgemoor, which occurred in 1685, 5 m. s.e. of B., and in which he was defeated by the royal army.

BRIDGEWATER, FRANCIS EGERTON, Duke of, styled the "Father of British Inland

Navigation," youngest son of Scroop, fourth earl and first duke of B.; was b. in 1736, and succeeded his elder brother, second duke, in 1748. In 1758-60, he obtained acts of parliament for making a navigable canal from Worsley to Salford, Lancashire, and carrying it over the Mersey and Irwell Navigation at Barton by an aqueduct 39 ft. above the surface of the water, and 200 yds. long, thus forming a communication between his coal mines at Worsley and Manchester on one level. In this great undertaking he was aided by the skill of James Brindley (q.v.), the celebrated engineer, and expended large sums of money. He was also a liberal promoter of the Grand Trunk Navigation; and the impulse he thus gave to the internal navigation of England, led to the extension of the canal system throughout the kingdom. He died unmarried, Mar. 8, 1803.

BRIDGEWATER, FRANCIS HENRY EGERTON, Earl of, son of John Egerton, bishop of Durham, grandnephew of the first duke of B., b. 1758, succeeded his brother as eighth earl, in 1823. Educated for the church, he had previously been prebendary of Durham. He died unmarried, in Feb., 1829, and the title became extinct. By his last will, dated Feb. 25, 1825, he left £8000, invested in the public funds, to be paid to the author of the best treatise *On the Power, Wisdom and Goodness of God, as manifested in the Creation*, illustrating such work by such arguments as the variety and formation of God's creatures in the animal, vegetable and mineral kingdoms, the effect of digestion, the construction of the hand of man, and by discoveries, ancient and modern, in arts, sciences, and the whole extent of literature. The then president of the royal society of London, Davies Gilbert, to whom the selection of the author was left, with the advice of the archbishop of Canterbury, the bishop of London, and a noble friend of the deceased earl, judiciously resolved that, instead of being given to one man for one work, the money should be allotted to eight different persons for eight separate treatises, though all connected with the same primary theme (see next article).

BRIDGEWATER TREATISES, eight celebrated works "On the Power, Wisdom, and Goodness of God," by eight of the most eminent authors in their respective departments, published under a bequest of the last earl of B. (q.v.), whereby each received £1,000, with the copyright of his own treatise. They are: 1. *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Thomas Chalmers, D.D. (Lond. 1833, 2 vols. 8vo). 2. *Chemistry, Meteorology, and the Function of Digestion, considered with Reference to Natural Theology*, by William Prout, M.D. (Lond. 1834, 8vo). 3. *On the History, Habits, and Instincts of Animals*, by the Rev. William Kirby (Lond. 1835, 2 vols. 8vo). 4. *On Geology and Mineralogy*, by the Rev. Dr. Buckland (Lond. 1837, 2 vols. 8vo). 5. *The Hand, its Mechanism and Vital Endowments, as Evincing Design*, by sir Charles Bell (Lond. 1837, 8vo). 6. *The Adaptation of External Nature to the Physical Condition of Man*, by John Kidd, M.D. (Lond. 1837, 8vo). 7. *Astronomy and General Physics, considered with Reference to Natural Theology*, by the Rev. William Whewell (Lond. 1839, 8vo). 8. *Animal and Vegetable Physiology, considered with Reference to Natural Theology*, by Peter Mark Roget, M.D. (Lond. 1840, 2 vols. 8vo).

BRIDGMAN, CHARLES DE WITT, D.D., b. Saugerties, N. Y., 1835; graduated at Roch. Theol. sem., 1857; was pastor Bapt. church, Morristown, N. J., 1857-60; Bapt. church, Jamaica Plains, Mass., 1860-62; Pearl St. Bapt. church, Albany, N. Y., 1862-78; 1878-91, pastor of Madison Ave. Bapt. church, New York, resigning to enter the Protestant Episcopal church. He edited *Songs for the Lord's House*, 1882. Dr. B. is master of an attractive pulpit style, conveying rich and vigorous thought.

BRIDGMAN, FREDERICK ARTHUR, b. Alabama, 1847; figure painter. He was by profession an engraver, but exhibited some paintings in New York before 1866, and in that year went to Paris. He studied under Gérôme, receiving, 1877, a third-class medal for his "Funeral of a Mummy," exhibited in the *Salon*. "In the Harem" is another of his numerous works, nearly all of which represent Oriental scenes. He was elected a member of the National Academy of Design in 1881. His "Procession of the Bull Apis" is in Washington, D. C., and his "Roumanian Lady," in Philadelphia.

BRIDGMAN, LAURA DEWEY, a famous blind deaf-mute, was b. in Hanover, N. H., on the 21st Dec., 1829. She was a bright, intelligent child, but at two years of age was seized with a violent fever, which utterly destroyed sight, smell and hearing. For a time this so shattered her system, that there seemed no hope of recovery; but she rallied, and soon learned to find her way about the house and neighborhood, and even learned to sew and to knit a little. A strong passion for imitation began to develop itself, and by assiduously cultivating this power, she was at last enabled to emerge out of her life of unbroken darkness and silence, and take her place among the educated people of the day. In 1839, Dr. Howe of Boston undertook her care and education at the Perkins institute. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others. Then she learned to read embossed letters by the touch; next, embossed words were attached to different articles, and she learned to associate each word with its corresponding object. A pat on the head told her when she was right in her spelling lesson. Thus far, however, the work was only an exercise of imitation and memory, roused into exertion by the motive of love of approbation, but seemingly without intellectual perception of the relation between words and things. It was like teaching a clever dog a variety of tricks. But at last the truth flashed upon her, that by this means she could communicate to others a sign of what was passing in her own mind. Her whole being seemed changed. The next step was to procure a set

of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so as to be read by the finger. In six months, she could write down the name of most common objects, and in two years had made great bodily and mental improvement. She grew happier, and enjoyed play like other children, amusing herself with imaginary dialogues, spelling old and new words, and with her left hand slapping the fingers of her right, if they spelled a word wrong; or giving herself a pat of approval, as the teacher did, when correct. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by the touch alone. In a year or two more, she was able to receive lessons in geography, algebra, and history. She received and answered letters from all parts of the world, and was always employed, and therefore always happy. Her brain seems to have been unduly excited for a blind person; she not only held imaginary dialogues with herself, but dreamed incessantly by night; and during these dreams, while asleep, talked much on her fingers. She learned to write a fair, legible, square hand, and to read with great dexterity, and at last, even to think deeply, and to reason with good sense and discrimination, so that she was employed as a teacher, and was highly successful. She d. in 1889. See *Life and Education of Laura Dewey Bridgman* (Boston, 1878).

BRIDLINGTON, or **BURLINGTON**, a sea-coast t. in the East Riding of Yorkshire (including Bridlington Quay, a port and bathing-place about 1 m. to the s.e.), 6 m. w. of Flamborough head, and 40 m. e.n.e. of York. B. is situated on a gentle slope in a recess of a beautiful bay. The country is hilly to the n., but subsides to the s. into a flat alluvial and fertile tract called Holderness. It has the aspect of an old town with narrow irregular streets. Pop. in '91, 8916. It has a considerable trade in corn. Bridlington Quay is well known as a watering-place. B. is supposed to have been the site of a Roman station. The Danes had strongholds in this vicinity for nearly 300 years, and many engagements between them and the Saxons and Normans occurred here. Great numbers of ancient tumuli or barrows still exist. An Augustine priory of immense wealth, and which subsisted for 400 years, was founded here by a grand-nephew of the Conqueror, and obtained many privileges from Henry I., and also from king John. Some parts of it yet remain. In 1643, Henrietta, queen of Charles I., landed here with arms and ammunition from Holland bought with the crown-jewels. Bridlington Quay has a chalybeate mineral spring, as well as an intermittent one of pure water. B. is noted for its chalk-flint fossils. In the lacustrine deposits near B. were found, some years ago, the bones of a large extinct elk, with branching horns, measuring 11 ft. from tip to tip.

BRIDPORT, a t. in Dorsetshire, in a vale at the confluence of the Asker and the Birt, or Brit, or Bride, 16 m. w.n.w. of Dorchester, and 2 m. from the English channel. It stands on an eminence surrounded by hills, and consists chiefly of three spacious and airy streets. It has manufactures of ropes, cordage, sail-cloth, etc., and some foreign and coasting trade. It sent two members to parliament till 1867, and one till 1885. Population '91, 6611.

BRIE, an old district of France between the Seine and the Marne, Meaux being the chief town. B. was and is celebrated for its cheese and grain. In old times a forest covered a great portion of the region. It was subdued by the Franks, and was a part of the kingdom of Neustria. In the 9th c., it was ruled by its own counts, but in 1361 it passed to the crown. The district is now comprised in the departments of Aisne and those adjoining.

BRIEF, a concise and orderly statement of the points of law-pleadings and evidences to be laid by one party to a cause before a court at its trial. The word is used in England and in the United States with very widely differing meanings. In Great Britain it is the duty of the attorney or solicitor to prepare the case only—to draw up and serve papers, to marshal the evidence, to prepare the case for trial generally; while to the barrister is committed the task of arguing the case before the court, introducing the evidence, cross-examining, and taking entire conduct of the case in open court. A brief under this English practise is the concise statement of the case as it leaves the hands of the attorney, and it serves as a guide to the barrister and as his instructions for proceeding in open court. In the practise of courts in the United States one person serves the office of both the English attorney and barrister. In our courts, accordingly, the brief is the abbreviated statement of pleadings, affidavits, evidence and all points of law to be argued, prepared by the counsel for his own use or to lay before the court as an assistance in following his presentation of the case. In appellate courts of the states and in the United States courts the brief is the skeleton or analysis of argument prepared by counsel, setting forth the legal propositions he offers, citing cases in support thereof, and indicating the rulings for which he argues. It is usual, and indeed in some states it is required by law, that such a brief should be printed and furnished to the court, to the legal reporter, and to opposing counsel. The phrase *Brief of Title* is sometimes employed in place of the usual term *Abstract of Title*, to denote concise statement of the deeds, conveyances, and changes in ownership which may have occurred in the history of the title of a certain piece of real estate.

BRIEF, or **BREVE**, **PAPAL** (Lat. *brevis*, short), a word which, in the corrupt Latinity of the early ages, was made to signify a short letter written to one or more persons

(hence the German *brief*, a letter). It is now used to denote certain pontifical writings, which, however, do not receive their name from the brevity of the composition, but from the smallness of the caligraphy. The papal B. differs from the papal bull (q.v.) in several points. It gives decisions on matters of inferior importance, such as discipline, dispensations, release from vows, indulgences, etc., which do not necessarily require the deliberations of a conclave of cardinals. Still, it is not to be confounded with the *motus proprii*, or private epistle of the pope as an individual, as its contents are always of an official character. His holiness speaks, as it were, with a kind of familiar parental of authority, and the B. is consequently superscribed *papa*, while the person to whom it is addressed is termed *dilecte fili* (beloved son). It is signed not by the pope, but by the *secretario de' brevi*, an officer of the papal chancery, with red wax, and only with the pope's private seal, the fisherman's ring; hence it concludes *Datum Romæ sub annulo piscatoris* (given at Rome under the ring of the fisherman). Like the bull, it is written on parchment, with this difference, that the bull is written on the rough side, and in ancient Gothic characters, while the brief is written on the smooth side, and in modern Roman characters.

BRIEG, a t. of Silesia, Prussia, about 27 m. s.e. of Breslau. It is situated on the left bank of the Oder, and on the railway between Breslau and Vienna, and is surrounded with walls, which have been partly converted into promenades. The streets are wide and regular, and commercially B. is a thriving town, its manufactures including linens, woollens, cottons, hosiery, ribbons, lace, leather, and tobacco. The battle-field of Mollwitz (q.v.) lies a little to the w. of Brieg. Pop. '80, 17,508; '90, 20,154.

BRIEL, BRIEL LE, or **THE BRILL**, a fortified seaport t., on the n. side of the island of Voorne, s. Holland. It is situated near the mouth of the Maas, about 14 m. w. of Rotterdam, in lat. 51° 54' n., and long. 4° 10' east. B. possesses a good harbor, and is intersected by several canals. It has a pop. of about 5000, the male portion of which are chiefly engaged as pilots and fishermen. B. may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marck, in 1572. This event was the first act of open hostility to Philip II., and paved the way to the complete liberation of the country from a foreign yoke. In 1585, B. was one of the towns made over to England as security for certain advances made to the states of Holland; it was restored to the Dutch in 1616. B. was the first town of Holland, which, without extraneous aid, expelled the French in 1813. The celebrated admirals De Witt and Van Tromp were natives of this place.

BRIENNE-LE-CHATEAU, or, as it is now called, **BRIENNE-NAPOLÉON**, a small t. in the dep. of Aube, France, on the right bank of the river Aube, and about 14 m. n.w. of Bar-sur-Aube. It is celebrated as the place where Napoleon I. received his earliest military education, he having entered the school here in 1779, when he was 10 years old, and remained until 1784. It is also remarkable on account of the battle fought here between the French and the allies in 1814. On the 29th of Jan., Bonaparte, who had collected his forces in the vicinity of B., with a view to check the advance of the allies on Paris, attacked Blücher, who was stationed in the town, and drove him out with considerable loss. In the struggle, the town, which was chiefly composed of wood, was almost reduced to ashes. On the 30th, the contest was renewed, and Blücher was forced to retreat to Trannes. On the following day, Napoleon deployed his forces in the plain between La Rothière and Trannes, and on Feb. 1, the corps of the crown-prince of Würtemberg and count Giulay, and the Russian reserves of grenadiers, having joined Blücher, prince Schwarzenberg gave orders to renew the combat. After a sanguinary struggle, during which Napoleon, feeling the importance of the contest, exerted all his influence over his troops, led several charges in person, and frequently exposed himself to danger, victory at length declared decisively for the allies at every point. During the night of Feb. 1, and the morning of the following day, the French troops retreated from Brienne-le-Chateau. The loss on both sides was about equal, consisting of nearly 5000 killed and wounded. The allies took 9000 prisoners, and 70 pieces of artillery. This victory at B. opened the way to Paris, and led to the fall of the empire.

BRIENZ, a t. of the canton of Bern, Switzerland, beautifully situated at the foot of the Bernese Alps, on the n.e. shore of the lake of the same name, and about 30 m. e.s.e. of Bern. Its cheese is held in high repute. Pop. about 3000.—The lake of B., which is about 8 m. long and 2 in breadth, is formed by the river Aar, at the foot of the Hasli valley, and by the same river it discharges its surplus waters into lake Thun. The lake is situated at an elevation of 1850 ft. above the sea; its average depth is about 500 ft., but in some places it is said to have a depth of more than 2000 feet. It is surrounded by elevated mountains, the principal of which is the Rothorn, from which splendid views of the whole range of the Bernese Alps are obtained. A small steamer plies daily on the lake between B. and Interlaken, touching at the celebrated Giessbach fall every trip.

BRIER CREEK, a stream in Warren co., Ga., where, in the revolution, the Americans under Gen. Ashe were defeated Feb. 27, 1779, by the English under Gen. Prevost; American loss about 250; English loss, 16.

BRIERLY HILL, an ecclesiastical district of Staffordshire, England, 2 m. n.e. from Stourbridge, on the Oxford, Worcester, and Wolverhampton railway. It is a place of much activity, the district abounding in coal, iron, and fire-clay; and there are here numerous collieries, large iron-works, glass-works, brick-works, and potteries. The manufacture of steam-boilers is extensively carried on. Pop. '91, 11,831.

BRIEUC, Sr., a seaport t., in the department of Côtes-du-Nord, France, situated on the right bank of the Gouet, about 2 m. from its mouth in the bay of St. B., a part of the English channel, in lat. 48° 31' n., and long. 2° 45' west. The town is said to owe its origin to an Irishman, St. Brieuc, who built a monastery here in the 5th century. St. B. has the ruins of an old tower that formerly defended the entrance to the river, but was partially blown up by order of Henri IV. in 1598, and a cathedral, part of which dates from the 11th century. Pop. '91, 16,941.

BRIGADE, in the military service, is a group of regiments or battalions combined into one body. Whenever an army takes the field, it is customary for three battalions to form a *brigade*, and two brigades a *division*. In the U. S. army, a brigade may consist of either cavalry, artillery, or infantry, under the command of a brigadier-general. Unlike the English brigade it is not a temporary grouping liable to be broken up at any time by the commander of the army. Two or more brigades form a division, and two or more divisions an army corps.

BRIGADE MAJOR is a military officer who exercises duties, in a brigade, analogous to those of the adjutant of a regiment. He attends to matters of discipline, and to the personal movements of the men. When regiments or battalions are brigaded, a B. M. is appointed, usually from among the captains. He conveys orders, keeps the rollster or roster, inspects guards and pickets, and directs exercises and evolutions; but he nevertheless remains on the books of a particular regiment, and returns to his regimental duties when the B. is broken up.

BRIGADIER, or **BRIGADIER-GENERAL**. In the English army usually a col. or lieutenant, who, for a limited time and for a special service, is placed upon brigade duties. He is then a general or commander of a brigade, which usually contains his own regiment as one of the number. In the U. S. army, an officer in command of a brigade. He is one degree higher than a col., and one degree lower than a maj-gen. He is sometimes called simply brigadier.

BRIGANDINE, among the articles of armor worn during the middle ages, was an assemblage of small plates of iron, sewed upon quilted linen or leather, and covered with a similar substance to hide the glittering of the metal. It formed a sort of coat or tunic. The B. was named from the *brigans*, a kind of light-armed irregular corps, employed something like the Cossacks and Bashi-bazouks of recent days, and, like them, addicted to marauding and pilfering; hence the word *brigand*.

BRIG—BRIGANTINE. A brig is a square-rigged vessel with two masts. A brigantine, or hermaphrodite brig, is a two-masted vessel, with the mainmast of a schooner and the foremast of a brig. A brig's mainsail is the lowest squaresail on the mainmast, whereas the mainsail of a brigantine is a fore-and-aft sail like that of a schooner.

BRIGGS, CHARLES AUGUSTUS, D.D., b. 1841; graduated at Union theol. sem., New York, 1863; studied at Univ. of Berlin, Prussia, 1866-69; ordained (Presb.) 1870; pastor at Roselle, N. J., 1870-74; pub. *Biblical Study* (1883), a work of recognized importance in biblical criticism; *Whither* (1889); prof. of Hebrew and cognate languages in Union theological seminary, N. Y., 1874-91; prof. of Biblical theology in the same institution, 1891. His inaugural address on taking this chair, on *The Authority of the Holy Scriptures*, contained statements respecting the Bible, inspiration, and the place of reason in religion that were voted heretical by the Presbytery of New York, and at the General Assembly of the Presbyterian Church in May, a committee report disapproving his appointment was adopted by a vote of 440 to 60. His case was protracted through several years and occasioned much controversy in religious circles. In 1893 the General Assembly suspended him from the ministry, but the seminary refused to remove him. His later works include *The Higher Criticism of the Hexateuch* (1893); *The Messiah of the Gospels* (1894); *The Messiah of the Apostles and Biblical Study* (1895), etc.

BRIGGS, CHARLES FREDERICK, 1810-77; b. Mass.; a journalist and author known as "Harry Franco." He started the *Broadway Journal*, in New York, of which Edgar A. Poe became an associate editor the year following its establishment; and in 1853 he became the first editor of *Putnam's Magazine*, which he conducted for several years. At a later period he was connected with the *New York Times*. Some of his works are *The Adventures of Harry Franco*; *The Haunted Merchant*; and *The Trippings of Tom Pepper*.

BRIGGS, HENRY, a distinguished mathematician, was b. in 1561 at Warleywood, near Halifax, Yorkshire, and studied at St. John's college, Cambridge. In 1596 he was appointed first reader in geometry at Gresham house (afterwards college), London, and in 1619 first Savilian professor of geometry in Oxford. This office he retained till the time of his death, which took place at Oxford, Jan. 26, 1631. B. made an important contribution to the theory of logarithms, of which he constructed invaluable tables. Napier the inventor had, in 1614, published a table of the so-called natural logarithms. when B. observed that another system, in which the logarithm of 10 should be taken as unity, would afford great facilities of calculation. Napier admitted the improvement

on his own system, and intended to assist in carrying the plan into effect; but died in 1618, when the whole work was left to Briggs. In the same year he published his *Chilias Prima Logarithmorum*, containing the first thousand natural numbers calculated to eight decimal places, and in 1624 published his *Arithmetica Logarithmica*, the fruit of many years of unwearied application, and giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 101,000, with 15 places. His system of logarithms is that now commonly adopted. Leaving others to carry out his calculations, for which he had provided every facility, he next employed himself on a table of logarithms of sines and tangents, carried to the hundredth part of a degree, and to 15 places, which, with a table of natural sines, tangents, and secants, was posthumously published at Gouda, in Holland, 1633, under the title of *Trigonometria Britannica*.

BRIGHAM, AMARIAH, 1798-1849; b. Mass.; a physician who devoted great attention to the cause and cure of insanity. He was superintendent of the retreat for the insane in Hartford, Conn., and of the New York state asylum. While at the latter institution he gave lectures and established the *Journal of Insanity*. Among his works are *Mental Cultivation and Excitement; The Influence of Religion upon the Health and Physical Welfare of Mankind; and The Anatomy, Physiology, and Pathology of the Brain*.

BRIGHT, JESSE D., b. New York, 1812. Early in life he settled in Indiana as a lawyer, and became state senator and lieutenant-governor. In 1845, he was elected to the United States senate, where he served 17 years. In 1862, he was expelled from the senate for having written to Jefferson Davis as "President of the Confederate States," recommending to him a man who desired to furnish arms for the confederates. He d. 1875.

BRIGHT, JOHN, an English statesman, politician, first brought into notice by the anti-corn law agitation, son of Jacob Bright, a Quaker cotton spinner and manufacturer at Rochdale, Lancashire, was b. at Greenbank, near that town, Nov. 16, 1811. In 1835, he made a foreign tour, which included a journey to Palestine, and, on his return, delivered before a literary institution at Rochdale, of which he was one of the founders, lectures on the subject of his travels, and on topics connected with commerce and political economy. When the anti-corn-law league was formed in 1839, he was one of its leading members and, with Mr. Cobden, engaged in an extensive free-trade agitation throughout the kingdom. In the spring of 1843, he offered himself as a candidate for the representation of Durham, and, though at first unsuccessful, he became in July of the same year, M.P. for that city. At all times an animated and effective speaker, B. was incessant, both at public meetings and in parliament, in his opposition to the corn laws, until they were finally repealed. In 1845, he obtained the appointment of a select committee of the house of commons on the game laws, and also one on the subject of cotton cultivation in India. An abridgment of the evidence taken before the former, published in one volume, contained from his pen an *Address to the Tenant Farmers of Great Britain* strongly condemning the existing game laws. At the general election of 1847, he was elected one of the members for Manchester. He co-operated with Mr. Cobden in the movement in favor of financial reform. On the formation of the first Derby ministry, Feb. 27, 1852, B. aided in the temporary reorganization of the corn-law league, in favor of the principles of free trade; and at the general election which followed, was re-elected for Manchester. A member of the peace society, and strenuously opposed to the war with Russia in 1854, B. was one of the meeting of the society of Friends, by whom a deputation was sent to the emperor Nicholas to urge upon him the maintenance of peace; and in 1855 he energetically denounced the Crimean war. A severe illness compelled him to withdraw for a time to the continent, and in his absence he was rejected by Manchester. Elected in 1857 for Birmingham, he seconded the motion against the second reading of the conspiracy bill, which led to the overthrow of lord Palmerston's government. His name then became chiefly associated with the movement for reforming the electoral representation, which resulted in the act of 1867. In 1868, he accepted office as president of the board of trade, but in 1870 was again obliged to retire, in consequence of severe illness. His health having been partially restored, he held office in 1873-74 as chancellor of the duchy of Lancaster, and again in 1881. In 1880 he was appointed lord rector of Glasgow univ. In 1882 he retired from the Gladstone ministry, being unable to support the government in its Egyptian policy. After that, his appearances were infrequent, but in 1883 he defended himself in the house of commons from a charge of breach of privilege in connection with speeches delivered at Birmingham. In 1886-88 he opposed the home rule policy of Gladstone. He d. Mar. 27, 1889. He was one of the most eloquent speakers of his time. A collection of his speeches was published in 1869; a *Life*, by Robertson (1877); his *Life and Speeches*, 2 vols., by G. Barnett Smith (1881); and his *Public Letters* (1885).

BRIGHT, RICHARD, 1789-1858; an English physician educated at Edinburgh, Berlin, and Vienna; from 1820 he was connected with Guy's hospital. He made many important medical observations (see **BRIGHT'S DISEASE**), and wrote numerous medical dissertations. His *Travels through Lower Hungary* (1818) contains a valuable account of the gypsies.

BRIGHT, WILLIAM, D.D., educator; b. Doncaster, England, in 1824; educated at Rugby and University college; ordained in 1850; became canon of Christ Church and regius professor of ecclesiastical history at Oxford in 1868; edited a number of important theological works, and published many sermons, etc.

BRIGHTENING, in calico-printing, is the operation of rendering the colors of printed fabrics more bright or brilliant, by boiling them in solutions of soda and other materials.

BRIGHTON, originally Brighthelmstone, a t. and a celebrated watering-place on the sea-coast of Sussex, 50½ m. s. of London. It is built on a slope ascending eastward to a range of high chalk-cliffs (backed by the South Downs), bounding the coast as far as Beachy Head; to the west, these hills recede from the coast, and leave a long stretch of sands. Anciently, Brighthelmstone was a mere fishing-village on a level under the cliff; and more than once it was burnt and plundered by French marauders. It was fortified by Henry VIII., and more strongly by Elizabeth; but the sea proved more dangerous than the French, and now washes over the site of the village of those days. The inroads of the sea in 1699, 1703, and 1705, undermined many cliffs and destroyed many houses. Its further inroads are prevented by a sea-wall of great strength (60 ft. high, 23 ft. thick at the base, and 2 m. long), extending along the cliffs, and built at the cost of £100,000. The writings of Dr. Russel, a celebrated physician of George II.'s time, first drew public attention to B. as an eligible watering-place, and the discovery of a chalybeate spring in the vicinity increased its popularity. The visit of the prince of Wales in 1782, and his subsequent yearly residence there, finally opened the eyes of the fashionable world to its immense attractions, and B. thenceforth became the crowded resort of a health-seeking population. Its progress has been very rapid, and the town is still steadily increasing. B. is for the most part extremely well built, as becomes a favored retreat of wealth and aristocracy. It mostly consists of new and elegant streets, squares, and terraces. The hotels are magnificent. A range of splendid houses fronts the sea for nearly 3 m., including the famous sea-wall, and the beach is easily accessible by gaps in the chalk-cliffs. Formerly, trees were a great rarity in B.; but within the last thirty years they have been planted both in and around the town, and are now to be seen of considerable size in the North Steyne Inclosures, the Level, and the Queen's park. Pop. in 1801, 7339; in '51, 65,569; in '91, 115,402; est. '96, 120,499. B. returns two members to parliament. The population is greatly increased during the fashionable season by the influx of visitors. The town was incorporated in 1854. Near the center of the town is the pavilion, or marine palace, a fantastic oriental or Chinese structure, with domes, minarets, and pinnacles, and Moorish stables, begun for the prince of Wales in 1784 and finished in 1827. It is now the property of the corporation of B., and, with its fine pleasure-grounds of above seven acres, it is devoted to the recreation of the inhabitants. It stands in the Steyne, an open space between the e. and w. parts of the town. The marine parade, a fine terrace, extends about a mile along the margin of the cliff, between the Steyne and Kemp town, a handsome district on the east. Westward, there is a similar parade or promenade, extending a great length in front of the more modern part of the town, and here there is daily a large and fashionable concourse. There are two piers—a chain pier on the e., opposite the marine parade, and a broad wooden pier on piles on the w.; both are used for promenading. A magnificent aquarium, 715' in length, was opened in 1872. B. has no maritime trade. It is reputedly a town to recreation and sea-bathing. Formerly there was a lack of trees to shade the promenades; the sea-breeze being adverse to the growth of trees. Races are held on the Downs, and formerly the volunteer reviews were held there, attracting many visitors each year. B. is connected with London, and also with the towns along the coast, by railways. From its salubrity, the town abounds in boarding-schools.

BRIGHT'S DISEASE (of the kidneys), so called after the English physician, Dr. Bright, who first investigated its character, consists of a degeneration of the tissues of the kidney into fat, and will be better understood after the anatomy of the organ has been studied. Suffice it to say now, that this degenerated condition impairs the excreting powers of the organ, so that the urea is not sufficiently separated from the blood. The flow of the latter, when charged with this urea, is retarded through the minute vessels, congestion ensues, and exudation of albumen and fibrin is the result. When we apply heat to the urine from a kidney so affected, it becomes opaque, showing that it contained *albumen* (q.v.); and on examining a drop of it under the microscope, we observe the exuded lymph mixed with epithelium in the form of casts of the small ducts of the diseased organ. The patient presents a flabby, bloodless look, is slow, and easily fatigued. The disease may succeed any of the eruptive fevers, and is frequently associated with enlargement of the heart.

The *causes* of this terrible malady are any which cause congestion of the kidneys—indulgence in strong drinks, long-continued suppuration, exposure to wet and cold, the exanthematous fevers, and pregnancy. The indications for *treatment* are, to remove any of those causes which may be present, rectify the other secretions, relieve any temporary congestion of the kidneys, at the same time endeavoring to increase the number of red blood globules by the administration of iron and vegetable bitters. And in the advanced

stages, when the blood is poisoning the nervous centers, attempts should be made to restore the secretion of urine by administering diuretics (q.v.), by giving hydrochloric and vegetable acids, sponging the patient with vinegar, and relieving the congestion of the brain by purgatives and local bleeding. See ALBUMINURIA.

BRIGITTINES, or ORDER OF OUR SAVIOR, founded in 1344, as a branch of the Augustinians, by St. Brigida or Brigitta, of Sweden. There were both monks and nuns who inhabited contiguous buildings, but were said never to see each other. Temporal affairs were supervised by the nuns; spiritual by the monks. The northern kingdoms of Europe had monasteries of this order, but the reformation swept them away. Henry V. founded one house near London; Henry VIII. suppressed it; Mary re-established it; and Elizabeth finally suppressed it. There are now no monks of the order. A few convents existed in 1860 in Bavaria, Poland, and elsewhere.

BRIGNOLES, a t. in the department of Var, France, beautifully situated in a fertile valley, surrounded by forest-clad hills, and watered by a stream called the Calami, about 22 m. w.s.w. of Draguignan. B., which is a very salubrious place, has manufactures of broadcloth, silk twist, soap, leather, pottery, etc.; and a trade in wines, brandy, olives, and prunes. Pop. '91, 4811.

BRIGNOLI, PASQUALE, 1820-84, b. Italy. After singing with much success in many of the principal opera houses in Europe he came to the United States in 1855, and for a quarter of a century was one of the most popular of operatic tenors. He acted in support of Mme. Patti when she first appeared there, and filled the same position with nearly every great singer who visited the United States.

BRIHUEGA, a t. of New Castile, Spain, 20 m. e.n.e. of Guadalajara, is situated on the Tajuña, and was formerly surrounded by walls, of which traces still exist. The remains of an old Moorish fortress now serve as a cemetery. B. has manufactures of woollens, linen, glass, and leather. Pop. 4000. Here, in 1710, during the war of the succession, the English general Stanhope, owing to the dilatoriness of his allies in affording him support, was defeated by the Duc de Vendôme, and compelled to surrender, with all his force, amounting to about 5500 men.

BRIL, the name of two Dutch painters.—**MATTIJS B.**, b. at Antwerp, 1550, went during his youth to Italy, and, under the patronage of pope Gregory XIII., painted several frescos in the Vatican. He was also distinguished as a historical and landscape painter. He died in 1584. His more celebrated younger brother, **PAUL B.**, b. 1554 or 1556, received instruction under Mattijs in Rome, and soon excelled his master. His pieces were at first conceived in the fantastic style which then prevailed; but gradually his style increased in power and beauty, until it exerted a striking influence over landscape-painting. The works of his riper age exhibit high poetical qualities, and a fine appreciation of the effects of light in the sky, which have been described as but little inferior to those of his great successor, Claude Lorraine. They have a character of solemn rest and calmness, and at times even an elegiac tone of melancholy, which well accords with representations of the glories of fallen Rome. A collection of excellent landscapes by B. is found in the palace Rospigliosi in Rome, and two beautiful landscapes enrich the gallery of the Pitti palace, Florence. Besides landscapes, B. painted scenes from Biblical history; among them, the "Tower of Babel," now in the Berlin museum. Other pictures by B. are found in the galleries of Munich, Vienna, and the Louvre. He died at Rome in 1626.

BRILL, *Rhombus vulgaris*, a fish of the same genus with the turbot (q.v.), found in considerable abundance on some parts of the British coasts, and common in the markets of the larger towns. It resembles the turbot more than any other British species of this genus, but is at once distinguished by its inferior breadth, which (excluding the fins) is only equal to half its entire length; by the want of tubercles on the upper surface; by a few of the most anterior rays of the dorsal fin being elongated beyond the membrane; and by the coloring, which is reddish sandy-brown on the upper side.

BRILLAT-SAVARIN, ANTHELME, 1755-1826; a French author, deputy in the states-general in 1789; judge of the court of cassation in 1792; the next year mayor of Bellay, but obliged to fly from the revolution. He went to New York, where he lived for three years, teaching French and playing in the orchestra of a theater. He returned to France in 1796, and under the consulate again became a judge. He wrote on political economy, and on the archæology of the department of Ain, but is best known by his *Physiology of Taste*.

BRILLIANT is a popular name given to the diamond when cut in a particular way. See DIAMOND.

BRIMSTONE (Saxon *brenne-stone*, a stone that burns) is the commercial name for sulphur (q.v.), in sticks or rolls.

BRINDISI (the ancient *Brundisium* or *Brundisium*), a seaport t. of southern Italy, in the province of Lecce, is situated on a small promontory in a bay of the Adriatic sea, about 45 m. e.n.e. of Taranto. B. is a city of very great antiquity. It was taken from

the Sallentines by the Romans 267 B.C., who some 20 years later established a colony here. The town, partly owing to the fertility of the country, but chiefly on account of its excellent port—consisting of an inner and outer harbor, the former perfectly landlocked, and capable of containing the largest fleets and of easy defense on account of its narrow entrance, and the latter also very well sheltered—rapidly increased in wealth and importance. It soon became the principal naval station of the Romans in the Adriatic. In 230 B.C., B. was the starting-place of the Roman troops that took part in the first Illyrian war; and from this point the Romans nearly always directed subsequent wars with Macedonia, Greece, and Asia. And when the Roman power had been firmly established beyond the Adriatic, B. became a city second to none in south Italy in commercial importance. Horace, who accompanied Mæcenas in a diplomatic expedition to B. in 40 B.C., has made the journey the subject of one of his satires (*Sat.* i. 5). Virgil died here in 19 B.C., on his return from Greece. The city appears to have retained its importance until the fall of the empire, but it suffered greatly in the wars which followed. When the Normans became possessed of it in the 11th c., the Crusaders made it their chief port for embarkation to the Holy Land; but with the decline of the crusades, B. sank into comparative insignificance as a naval station. The city subsequently suffered greatly from wars and earthquakes. The principal buildings are the cathedral, where the emperor Frederick II. was married to Yolanda in 1225; and the castle, commenced by Frederick II., and finished by Charles V. The district around B. is still remarkable for its fertility, olive oil being produced in large quantities. Some years ago, B. was constituted an entrepôt for foreign goods. Since the establishment of the overland route to India, B. has greatly increased in importance. Pop. 16,721.

BRINDLEY, JAMES, an eminent English mechanic and engineer, b. in Thornsett, near Chapelen-le-Firth, Derbyshire, in 1716. Apprenticed at 17 to a millwright, he afterwards became an engineer, and in 1752 showed great ingenuity in contriving a water-engine for draining a coal-mine. A silk-mill on a new plan, and several others of his works, recommended him to the duke of Bridgewater (q.v.), who employed him to execute the canal between Worsley and Manchester. Thenceforth he devoted his great skill and genius to the construction of navigable canals; commenced the Grand Trunk, and completed the Birmingham, Chesterfield, and others. Once, when under examination before a committee of the house of commons, being jocularly asked for what purpose he supposed rivers to have been created, he is said to have replied: "Undoubtedly to feed navigable canals." He died in 1772.

BRINE is the term applied to water highly impregnated with common salt, and **BRINE SPRINGS** are those natural waters containing much salt, which in many parts of the world gush out from fissures in the ground. See **SALT**.

BRINE-SHRIMP, *Artemia salina*, a small crustacean, of the order *branchiopoda* (q.v.), which, unlike the greater number of animals of that order, is an inhabitant not of fresh but of salt water, and is indeed remarkable, because it is to be found in myriads swimming about in the brine of salt-pans previous to boiling, when, having been concentrated by exposure to sun and air for about a fortnight, it destroys the life of almost all other marine animals. The full-grown B. is about half an inch long.

BRINJAREE DOG, a rough-haired or long-haired variety of greyhound (q.v.), used in the Deccan, and said to be the best of the hunting-dogs of India. It is said to be superior in size and strength to the Persian greyhound, but not to be equal to the British greyhound in swiftness. It is generally of a yellowish or tan color.

BRINTON, DANIEL GARRISON, M.D., LL.D., archæologist and ethnologist; born at Thornbury, Pa., May 13th, 1837; educated at Yale, the Jefferson Medical College of Philadelphia, Paris, and Heidelberg. After serving in the army as a surgeon, he became editor of the *Medical and Surgical Reporter* (1867-87), Professor of Ethnology at the Philadelphia Academy of Natural Sciences, and of American Linguistics, Archæology in the University of Pennsylvania (1886), and president of the American Association for the Advancement of Science (1894). His chief works are *The Myths of the New World* (1868); *The Iroquois Book of Rites* (1883); *Races and Peoples* (1890); *The American Race* (1892); *A Primer of Mayan Hieroglyphics* (1896), etc. He is also the editor of the *Library of Aboriginal American Literature*.

BRINVILLIERS, MARIE MARGUERITE, Marquise de, notorious as a poisoner in the time of Louis XIV., was the daughter of Dreux d'Aubray, lieutenant of Paris, and received a careful education. In 1651, she was married, while still young, to the marquis de Brinvilliers. This nobleman seems to have been a gay and careless spendthrift, who allowed his wife to do very much as she pleased. He even introduced to her a young officer named Jean Baptiste de Gaudin, Seigneur de St. Croix, who was exceedingly handsome, and who inspired her with a violent passion. Her easy husband, however, was wholly indifferent to his wife's conduct; but her father, who seems to have had a stricter sense of duty, caused St. Croix to be arrested and imprisoned in the Bastille. It was here the latter learned the art of preparing poisons, from an Italian, and on his

release he imparted his fatal knowledge to his mistress, who, during his incarceration, had affected the greatest piety, spending most of her time in visiting the hospitals and in attending the sick. The marchioness now resolved to destroy her father. St. Croix eagerly abetted her, in the hope of obtaining a portion of the paternal inheritance; but in order to test the efficacy of the poison, she tried its effects upon the invalids of the *Hôtel Dieu*. Having satisfied herself, she commenced operations on her parent, surreptitiously giving him small doses of the poison for eight months, until her diabolical patience was exhausted, and she was at last induced to administer a very violent dose. He died, and no one suspected the marchioness. With St. Croix's assistance, and that of a domestic servant, Jean Amelin, *alias* Chaussée, she next poisoned with the same fearful indifference to crime, her two brothers and her sisters; her object being to find means of supporting her extravagant style of living with her paramour. Several times she attempted to poison the marquis, her husband; but he escaped, and, as was said, by means of antidotes given by St. Croix, who dreaded that he should be compelled to marry the widow. St. Croix died suddenly in 1672—his glass mask having fallen off while he was engaged in preparing a poison—leaving documents inculcating the marchioness. She was also accused about the same time by her accomplice Chaussée, who, being arrested, confessed all, and was condemned to be broken alive. The marchioness escaped to England; afterwards she traveled into Germany, and next went to Liège, where she took refuge in a convent. From this, however, she was craftily decoyed by an officer of justice disguised as an abbé, and conveyed to Paris. Among her papers was found a general confession of her crimes, including the above-mentioned murders, and many others. One strange confession stated that, out of pity for a virtuous young lady who had been imprisoned in a convent, the marchioness had poisoned a whole family! It is a singular fact, that this infamous woman was a bigot in her religious tenets, and was quite exemplary in her attendance at church. At her trial in Paris, she at first denied all charges brought against her, and pretended that the "general confession" had been written during the insanity caused by a fever; but after being put to the torture, she made a full confession, and was beheaded, July 16, 1676. Her career had excited such terror in France, that Louis XIV. instituted a distinct tribunal, the *chambre ardente* (q.v.), to investigate cases of poisoning by the "succession powder" used by the marchioness.

BRIOCHE (Fr.), a kind of cake, made with flour, eggs, and butter. The name is also given to a circular soft cushion, used as a foot-rest, as well as to a stitch in knitting, used in making this kind of foot-stool.

BRION, GUSTAVE, b. 1824; a French painter. Among his chief works are "The Potato Harvest during the Inundation," "A Funeral in the Vosges," "A Marriage in Alsace," and "The Sixth Day of Creation," the latter exhibited in New York. D. 1877.

BRION, LUIS, 1782-1821; an admiral in the Colombian service, who served in the army of Holland, studied navigation in the United States, and in 1811 was appointed captain of a frigate in the service of Caraccas.

BRIOUDE, a t. of France, in the department of Haute-Loire, situated near the left bank of the river Allier, about 29 m. n.w. of Le Puy. It occupies the site of *Brivas*, a town of the ancient Averni. Its principal buildings are the college and the church of St. Julien, founded in the 9th c., on the site of a still more ancient edifice erected on the spot where the saint was martyred. There is a well-known bridge at Vieille B. There are coal-mines near by. Lafayette was born here. Pop. '91, 4928.

BRISBANE. 1. B., an inland co. of Queensland, about 120 m. n.n.w. of Sydney.—2. B., a seaport, the capital of Queensland, about 640 m. n. of Sydney. It stands near the mouth of a river of its own name, which falls into Moreton bay. Regular steam communication is kept up with London and with Australian ports. B. possesses some fine buildings, among the chief of which are the houses of the legislature, which cost £100,000, the post-office, and the viceregal lodge. Several railroads terminate here. North and South B., two of its divisions, were connected by the Victoria iron bridge, 1080 feet in length, which was destroyed by flood in 1893. There are numerous churches, banks, and newspapers, four parks, a museum, a school of arts, a university, and a large export trade. Population in 1891, 48,738.

BRISBANE, General Sir THOMAS MAKDOUGAL, a distinguished soldier and astronomer, was b. at Brisbane, the hereditary seat of his family, near Largs, Ayrshire, July 23, 1773. At the early age of 16 he entered the army as an ensign, and in the following year, when quartered in Ireland, he formed an intimate acquaintance with Arthur Wellesley, afterwards duke of Wellington. With a company he had raised in Glasgow in 1793, B. took part in all the engagements of the campaign in Flanders; and in the West Indies, to which he was sent in 1796, he greatly distinguished himself under sir Ralph Abercromby. He afterwards served in the West Indies as col. of the 69th; and in 1812 obtained command of a brigade under the duke of Wellington in Spain. For his conspicuous bravery at the battle of the Nive he received the thanks of parliament. When Napoleon abdicated, B. was sent in command of a brigade to North America, from whence he was recalled in 1815, but too late to admit of his being present at Waterloo. In 1821, B., on the recommendation of his friend the duke, was appointed governor of New South

Wales, a position he held for four years, during which time he introduced many wise reforms, especially in penal treatment; secured at his own expense good breeds of horses for the colony; promoted the cultivation of the sugar-cane, vine, tobacco, and cotton; and left at the close of his administration—which was marked by perfect tolerance and protection of all classes of Christians—50,000 acres of cleared land where he had found only 25,000. But high as B. ranks as a soldier and administrator, as a man of science he holds a still higher place. While in Australia, he catalogued no less than 7385 stars, for which great work—known as “the Brisbane Catalogue of Stars”—he received the Copley medal from the Royal Society. On his return to Scotland, he had an astronomical observatory established at his residence at Makerstoun, and devoted himself entirely to scientific pursuits. He entered warmly into the plans of the British Association for ascertaining the laws of the earth’s magnetism, and in 1841 had a splendid magnetic observatory erected at Makerstoun, the observations made there filling three large volumes. D. 1860.

BRISCOE, a co. in the “Panhandle” of Texas; formed 1876, and organized 1892, drained by head-waters of Red river; 900 sq. m. Pop. ’80, 12; ’90, not reported. Co. seat, Silvertown.

BRISKET is the breast of an animal, the part of an animal that lies next to the ribs, and immediately covering the breast bone; also a joint of meat.

BRISSON, EUGÈNE HENRI, b. Bourges, France, 1835; studied law at Paris, where he started a republican journal called *L’Avenir*. He was elected to the national assembly as a Republican in 1871; became president of the chamber of deputies in 1881, 1894, and 1897; and in the election for president of the republic, to succeed M. Casimir-Perier, Jan. 17, 1895, he received 361 votes to 430 for Francis Félix Faure.

BRISSOT, JEAN PIERRE, one of the first movers in the outbreak of the French revolution, and afterwards numbered among its victims, was b. at Chartres, in 1754, and educated for the bar. After completing his studies at Paris, he went into the office of a procurator, but quickly abandoned the legal profession for the more congenial one of authorship. From his earliest years he had devoted himself with passionate eagerness to literary studies, especially history, economics, and politics, and, among the other lingual accomplishments, acquired a thorough mastery of English. His first work, *Théorie des Lois Criminelles* (1780), gained the approbation of Voltaire and D’Alembert, and was followed by his *Bibliothèque des Lois Criminelles*, which established his reputation as a jurist. Having removed to London, he there started a learned journal, under the title *Lyceum*, for which, however, he found no adequate support. He therefore returned to Paris, and soon afterwards was imprisoned in the Bastille, on a charge of having written against the queen a brochure, which, in fact, was penned by the marquis de Pelleport. After four months in the Bastille, he was liberated through the intervention of Madame de Genlis and the duke of Orleans. B. continued to write tracts on finance, etc., but his love of freedom and vehement hatred of despotism again involved him in danger, and, to escape from a *lettre-de-cachet*, he was once more compelled to retire to England. He afterwards visited North America, as representative of the *Société des Amis des Noirs*. On his return to France, he zealously assisted in the outbreak of the revolution, and was in consequence elected by the citizens of Paris their representative in the constituent assembly, where he exercised a predominant influence over all the early movements of the revolution. He also established a journal, called *Le Patriote Français*, which became the recognized organ of the earliest republicans; and, through his superior knowledge of politics and the usages of constitutional countries, he gathered round him all the young men of talent and spirit who were opposed to the court-theory of absolute sovereignty. It thus happened that, without his being formally considered the head of a party, all the movements of the early revolutionists were profoundly influenced by him, and he incurred the bitter hatred of the court reactionists, who affixed the nickname of Brissotins to all the advocates of reform. Afterwards, the Brissotins formed the Girondist party. In the convention, B. was representative of the department Eure-et-Loir. Here his moderation made him suspected as a friend of royalty, as he opposed the “men of September” and the trial and condemnation of the king. When Louis XVI. heard his doom pronounced, he exclaimed: “I believed that Brissot would have saved me!” But B. was weak enough to imagine that the best way to save the king would be to vote first for his death, and then appeal to the nation. B. and his party, which was perhaps the purest in principle and the weakest in action, ultimately fell before the fierce accusations of the Mountain, or Jacobin party, which believed, or at least pretended to believe, that the virtuous B. had received money from the court to employ against the revolution. With 20 other Girondists, B. suffered death under the guillotine, Oct. 30, 1793.

BRISTED, CHARLES ASTOR, son of the Rev. John Bristed, grandson of John Jacob Astor, b. N. Y., 1820. He was educated at Yale and at Trinity college, Cambridge, Eng., graduating in 1845. For several years he was a contributor to periodical literature over the signature of “Carl Benson.” He was one of the first board of trustees of the Astor library. Among his collected works are: *The Upper Ten Thousand of New York*; *Selections from Catullus*; *Five Years in an English University*; *The Interference Theory of the Government*; and *Letter to Horace Mann*, in which he replied to attacks upon John Jacob Astor and Stephen Girard. He d. 1874.

BRISTLES, the strong hairs growing on the back of the hog and wild boar, and extensively used in the manufacture of brushes, and also by shoemakers and saddlers. They form an important article of British import, between 2 and 3 million pounds being annually imported, chiefly from Russia and Germany; but they are also obtained from France and Belgium, and small quantities of inferior quality have recently been received from China. From Russia, the average annual value of B. imported into Britain is £300,000. Siberia alone supplying about £150,000. Russian B. vary in value from \$30 to \$300 per cwt. From Germany about \$500,000 worth per annum is exported, varying from \$30 per cwt. to \$175 per cwt. From France and Belgium, about \$100,000, varying in value from 50c. to about \$1.12 per pound. The quality of B. depends on the length, stiffness, color, and straightness—white being the most valuable. The best bristles are produced by pigs that inhabit cold countries. The Russian hog is a long, spare animal, and the thinner the hog, the longer and stiffer the bristles. When the Russian hog is sent to the south and fattened, the B. become soft, and of course depreciated in value. In the summer, the hogs are driven in herds through the forests, to feed on soft roots, etc., when they shed their B. by rubbing themselves against the trees. The B. are then collected, sewed up in horse or ox hides, and sent to fairs, whence they find their way, through agents, to all countries.

BRISTOL, a co. in s.e. Mass., bordering on Rhode Island and the ocean, 557 sq. m.; pop. '75, 131,087; in '90, 186,465. It is drained by Pawtucket and Taunton rivers, and has nearly 20 m. of sea-coast. There is considerable agriculture, but the main business is manufacturing of cotton, wool, etc. There are five railroads intersecting the various parts of the county. Co. seats, Taunton and New Bedford.

BRISTOL, a co. in e. Rhode Island, bordering on Mass.; 25 sq. m.; pop. '90, 11,428. It has an uneven surface, with some fine scenery and fertile soil. Two railroads traverse its territory. Co. seat, Bristol.

BRISTOL, a town in Hartford co., Conn., on the New England railroad, 18 m. w.s.w. of Hartford. It has electric lights, banking facilities, high school, Y. M. C. A., and library, and weekly newspapers, and manufactories of clocks, brass goods, table ware, knit goods, tools, etc. The town was originally a part of Farmington. Pop. '90, 7382.

BRISTOL, a borough in Bucks co., Penn., on the Delaware river, the Pennsylvania canal, and the Pennsylvania railroad; 21 m. n.e. of Philadelphia, opposite Burlington, N. J. It has foundry and rolling mills, carpet factory, and hosiery, worsted, and yarn mills; banking facilities, high school, electric lights, weekly newspapers; and a well-known mineral spring. Pop. '90, 6553.

BRISTOL, a town, port of entry and co. seat of Bristol co., R. I.; on the Narraganset Bay and the New York, New Haven and Hartford railroad; 15 miles s.e. of Providence. It was incorporated in 1746 and a portion of it was annexed to Warren in 1873. The town is the site of the residence of King Philip, the great Narraganset chief; it has an excellent harbor; and the principal industries are boatbuilding and the manufacture of rubber, woolen and cotton goods. Pop. '90, 5478.

BRISTOL, an important maritime city in the w. of England, long. 2° 35' 28" w., lat. 51° 27' 6" n. situated at the junction of the rivers Frome and Avon, and partly in the counties of Gloucestershire and Somerset. It is six miles from the mouth of the Avon. Since the year 1373 it has formed a county by itself. Among the ancient buildings may be mentioned the cathedral, formerly an Augustinian church (1148). A part of it was pulled down in the 15th century, but has been rebuilt (1877); the choir dates from the 14th century, and the Norman chapter-house and gateway are still standing. Some remains still exist of the ancient castle, built probably by Geoffrey, bishop of Coutances, and improved by Robert, earl of Gloucester, in the early part of the 12th century. St. James's church is a good specimen of Norman architecture, and other noted churches are St. Philip's, St. Jacob's, St. Stephen's, All Saints, the Mayor's Chapel, and the Temple church, but more famous than these, perhaps, is the church of St. Mary Redcliffe, whose spire was completed in 1872. The modern portions of B., including Clifton, Cotham, Redland, etc., consist of handsome residences in squares, terraces, crescents, and detached villas, and some excellent specimens of architecture in churches, chapels, assembly and club rooms. The floating harbor and quays are very extensive and are formed by embanking and locking the old courses of the rivers, which now flow through a new channel. The city is one of the most important ports in Great Britain, and its trade is of long standing. In the records of the 14th century it is mentioned as having a large trade in cloths, leather, wine, and salt, and was one of the "staple towns." It was prominent in the early commercial ventures and in discovery. It was the port from which John Cabot sailed, the discoverer of North America, and his son Sebastian Cabot is said to have been born here. Bristol traders colonized Newfoundland and engaged largely in the commerce with the West Indies and the American colonies. In the 18th century it was famous for its privateering. Shipbuilding has been a prominent industry there for many years. The *Great Western*, the pioneer of steam-communication across the Atlantic, was built at Bristol in 1838. The dock accommodations are extensive, and in 1883 the municipal incorporation purchased large docks at Avonmouth and Portis-

head. The principal imports are oils, hides, petroleum, grain, tallow, and sugar; the exports are iron, copper, tinplates, coal, salt, cotton goods, earthenware, chemicals, and other manufactured products. The total tonnage entered and cleared at the port in the year 1895 was 948,867. Bristol returned two members to parliament until 1885, when the number was increased to four. The municipal government is vested in a mayor, a board of aldermen, town-councillors, a lord-lieutenant, and a lord high steward. The police arrangements are efficient, and the city has a large jail. The benevolent institutions of B. are numerous and well supported. Among them are hospitals; asylums for the blind, deaf mutes, orphans; almshouses, reformatories, etc. Besides many free schools and institutions for secondary education, the city has a university and Clifton College. The number of students attending the former in the year 1896 was 496, and the faculty numbered 47. It contains numerous places of worship belonging to all denominations. Bristol received its charter from Henry II. in 1171. Edward III. gave it the rights of a county in 1247. The parishes of Redcliffe, Temple, and St. Thomas were added. During the civil wars it was alternately taken by royalists and parliamentarians, and by the latter the castle and fortifications were razed. It afterwards became the principal port of trade with the West Indies, and carried on a flourishing business in negro slaves. In 1793 the "bridge riots" occurred. In 1831 the "reform bill riots" resulted in the destruction of the bishop's palace, custom-house, excise-office, jail, toll-houses, a number of private residences, and several lives. The Reform Bill itself gave the city its present municipal boundaries. Many noted names are identified with the history of the city; among them are William of Worcester; Canynge, the great merchant, and restorer of Redcliffe church; the poets, Southey and Chatterton; the artists Lawrence and Baily; Sydney Smith, canon of Bristol cathedral; Robert Hall, Coleridge, Hannah More, and the Misses Porter. The population of Bristol proper was, in 1871, 62,662, and of the suburban districts, 141,378—total, 204,040. In 1896 the population included in the municipal borough was estimated at 230,623.

BRISTOL BAY, an arm of the Pacific ocean, or Bering sea, lying immediately to the n. of the peninsula of Alaska. B. B. receives the waters of two considerable lakes, which, communicating with each other, offer an opening into the interior.

BRISTOL BOARD, a thick stiff paper for drawing, made with a smooth and sometimes with a glazed surface. It was first made at Bristol, Eng.

BRISTOL BRICK, or **BATH BRICK**, formerly made only in Bristol, Eng., but now made in New Hampshire and other parts of the United States. It is composed of fine-grit sand, and used mainly for cleaning and polishing steel surfaces.

BRISTOL CHANNEL, an inlet of the Atlantic ocean, in the s.w. of England, between South Wales on the n., and Devon and Somerset shires on the s.; or it may be regarded as an extension of the estuary of the river Severn. It is about 80 m. long and 5 to 48 m. broad, the greatest breadth being between St. Gowan's head and Hartland point, its most western and external points, this line passing through Lundy isle. It is the largest inlet or estuary in Britain, having a very irregular coast-line of 220 m., and receiving a drainage of 11,000 sq. miles. The chief rivers which flow into it are the Towy, Taff, Usk, Wye, Severn, Avon, Axe, Parrot, Taw, and Torridge. The tides in it rise to an extraordinary height—at Bristol, 35 ft.; at King's road, 40; and at Chepstow sometimes 70. The rapid flow of the tides meeting the currents of the rivers produces, in the narrow parts of the channel, and in the mouths of one or two of the rivers which enter it, the phenomenon of the *bore*, the tide advancing like a wall of water, sometimes 6 to 9 ft. high.

BRISTOW, BENJAMIN HELM, b. Ky., 1832; practiced law until the commencement of the civil war, when he volunteered and served in the union army, rising to col. He was appointed United States solicitor-general in 1870, but was not confirmed; attorney-general in 1873, and secretary of treasury in 1874. In the last office he was active in the prosecution of the "Whisky ring." He began practicing law in New York city in 1876, and d. there in 1896.

BRISTOW STATION, a village in Virginia, 4 m. s.w.s. of Manassas Junction, where two engagements took place during the civil war—one Aug. 27, 1862, closed by darkness, and indecisive; and one Oct. 14, 1863, when the Confederates, who made the attack, were repulsed.

BRIT, *Clupea minima* (Peck), a species of herring, very small, found in great abundance at certain seasons off the New England coast, where it serves as food for bluefish. It is seldom more than 3 in. long, and is of no importance for the table.

BRITAIN, GREAT. See GREAT BRITAIN.

BRITAIN, NEW. See NEW BRITAIN.

BRITANNIA (perhaps from Celtic *brith* or *brit*, painted, the ancient Britons being in the habit of painting their bodies blue with woad), the ancient name of the island of Great Britain (see BRITANNICÆ INSULÆ). The Romans under Julius Cæsar (who wished to chastise the Britons for aiding the Veneti, a tribe in Gaul, against the Roman power) invaded Britain in 55 and 54 B.C. but they did not, for a hundred years afterwards, proceed with vigor to subdue the country. After a desperate resistance by the native

British princes, especially Caractacus and Boadicea, the s. half of Britain was conquered by Vespasian, and made a Roman province in the reign of Claudius, about 50 A.D. Agricola, sent by Nero in 79 A.D., consolidated these conquests, and extended the influence of Rome to the firths of Forth and Clyde, between which, in 84 A.D., he erected a chain of forts to repel the inroads of the northern Caledonians, in the line of the stone wall of Antoninus, afterwards erected, in 140 A.D., by Lollius Urbicus. Agricola was the first Roman to sail round the island, and the first Roman general to come in contact with the Caledonians, whom, under their leader Galgacus, he overthrew, in 84 A.D., at a hill called the Mons Grampius, the situation of which has not been satisfactorily determined. The Romans made many ineffectual attempts to subdue the Caledonian barbarians, and penetrated, for this purpose, through the n.e. part of Scotland as far as the Moray firth, as is attested by the remains of Roman camps and stations still existing along their line of march, and the relics of Roman art found in connection with them. Not only did the Caledonians on their own soil resist the Roman sway, but by constant inroads into the Roman territory s. of the wall of Antoninus, they so harassed the Romans themselves, that the latter were forced to abandon their conquests for 80 m. s. of that wall, and to secure permanently their remaining conquests in South Britain by a line of defensive works between the mouth of the Tyne and the Solway firth, called the wall of Hadrian (q.v.), begun by Agricola, in 80 A.D., strengthened by Hadrian in 121, and rebuilt and completed by Severus in 210 A.D. After this last date the Romans did not attempt to regain their lost provinces. Subject to these incursions of the Caledonians, the opposition of the native British princes, and the invasion of tribes from the opposite shores of the continent, the Romans held sway in Britain down to about 420 A.D., soon after which time the Saxons invaded s. Britain, and ultimately subdued it. Britain, s. of the Solway firth and the mouth of the Tyne, in the reign of Claudius, formed one Roman province under a consular legatus and a procurator. Ptolemy mentions 17 native tribes as inhabiting this tract. Toward the close of the 4th c. A.D., Roman Britain constituted a diocese in the prefecture of Gaul, and was divided into five provinces, of which the boundaries, though uncertain, are supposed to have been as follows: B. Prima, England s. of the Thames and the Bristol channel; B. Secunda, Wales; Flavia Cæsariensis, the country between the Thames, Severn, Mersey, and Humber; Maxima Cæsariensis, the rest of England to the Scottish border; and Valentia—soon abandoned by the Romans—or Scotland s. of the wall of Antoninus. At this time, also, the inhabitants of Roman Britain included Phenician, Roman, and Germanic elements, which had become incorporated with the native Britons, who were of Celtic or Gaelic descent. The Romans governed Britain by a vicarius or vicegerent resident at Eboracum (York), under whom were consulars, presidents, and other subordinate officers. To insure the obedience of the natives, at least three Roman legions—chiefly composed of Gauls, Germans, Iberians, and but few pure Romans—were stationed in Britain; viz., at Eboracum, Deva (Chester), and Isca Damnoniorum (Exeter). Under the Romans, many towns (*coloniae* and *municipia*)—56 are enumerated by Ptolemy—arose in Britain, and diffused Roman law and civilization over the country. The towns of Eboracum (York) and Verulamium (near St. Albans) had the privileges of Roman citizenship. The Romans made many roads or streets (*strata*), of which there are still numerous remains, across the country, all centering in London. They also developed it into a corn-growing country. Druidism was the religion of the Britons at their conquest by the Romans, but the latter introduced Christianity and Roman literature into the country. There are many remains still extant of the presence of the Romans in Britain, such as camps, roads, ruins of houses, baths, flues, altars, mosaic pavements, painted walls, metallic implements and ornaments, weapons, tools, utensils, pottery, coins, sculptures, bronzes, inscriptions, etc. These remains show that the Romans wished to render their British conquests permanent, and that they had greatly improved the arts of the ancient Britons, as is evident on comparing the remains with the far ruder native antiquities of the British pre-Roman or prehistoric era, such as tumuli, barrows, earthworks, so-called Druidical monoliths and circles, cromlechs, cairns, pottery, weapons, tools, utensils, ornaments, etc. Many of the Roman remains in Britain also show that the Romans had introduced into the country the refinements and luxuries of Rome itself.

Under the term BRITANNIA, Great Britain has been personified in the fine arts as a female seated on a globe or on an insulated rock, and leaning with one arm on a shield, the other hand grasping a spear or a trident. The first example of this personification is on a Roman coin of Antoninus Pius (died 161 A.D.). The figure reappears first on the copper coinage of England in the reign of Charles II. (1665); the celebrated beauty, Miss Stewart, afterwards duchess of Richmond, is said to have served as model to the engraver, Philip Roetier. The Britannia that appears on the reverse of British copper coins since 1825 was the design of Mr. W. Wyon. See NUMISMATICS.

BRITANNIA METAL. The present composition of britannia metal varies. Much of it is 90 tin + 8 antimony + 2 copper, without any zinc or bismuth. Another formula is 81 tin, 16 antimony, 1 copper, and 2 zinc. But most of the alloys passing under this name have between 80 and 90 per cent. of tin with varying proportions of antimony and copper. The manufacture was begun at Sheffield by Hancock and Jessop.

In 1770; it reached Birmingham towards the close of the century, and made gradual progress. At first, the articles were made by stamping with dies, and soldering up into form; this being a slow operation, rendered the articles expensive. Afterwards, the curious process of *metal spinning* was introduced; and this, with the subsidiary operation of swagging, rendered a great reduction in price possible. In the spinning process, a thin sheet or piece of britannia metal is placed upon a wooden model shaped like the article to be made; the model is made to rotate in a lathe; and burnishers and other tools are employed to press the yielding metal into all the curvatures of the model. Ductility is an essential quality to the attainment of this end with the metal; how complete it is, may be seen in such articles as britannia metal teapots and dish-covers, the principal forms of which are not given by hammering, stamping, or casting, but by spinning. Besides spinning and swagging, the processes include stamping, soldering, casting, and polishing. When electro-plating was introduced, an increased use of britannia metal arose, as it forms a good ground or basis for the deposited silver. Britannia metal spoons and ladles, made by casting, stamping, and burnishing, have been nearly driven out of the market by German silver; but the former metal is more largely used than ever for hot-water jugs, soup tureens, gravy-dishes, vegetable and side dishes, dram bottles, drinking-cups, sandwich cases, wine-coolers, soap-boxes, liquor-frames, cruets, waiters, trays, etc.; and as a basis for electro-plate. Birmingham and Sheffield are the chief seats of the manufacture. After electro-plating came into general use in the decade 1840-50, the trade in B. M. wares became double what it was previously. A variety of B. M. called *queen's metal* is extensively used for similar purposes, and it ranks intermediate in hardness between pewter and ordinary B. M. Queen's metal is composed of—tin, 9; antimony, 1; bismuth, 1; and lead, 1.

BRITANNIA SECUNDA, the Roman name of Wales (q.v.).

BRITANNIA TUBULAR BRIDGE, a railway bridge over the Menai strait, remarkable alike for its gigantic dimensions, and as being the first construction of the kind ever undertaken. With a view to facilitate communication with Ireland *via* Holyhead, the directors of the Chester and Holyhead railway in 1845 sought the aid of Mr. Robert Stephenson, the great engineer, to bridge the strait with such a structure as should admit of the safe passage of heavily laden trains without in any way interfering with the navigation of the channel. About a mile above the suspension-bridge, and nearer Carnarvon, a rock in the middle of the strait rose 10 ft. above the water at low tide; and on this site, provided by nature, it was resolved to erect a bridge in the form of a rectangular tube, composed of wrought-iron plates riveted together in a manner to combine the greatest strength with the greatest lightness. See **STRENGTH OF MATERIALS** and **TUBULAR BRIDGES**. In the spring of 1846, the undertaking was commenced; by the 22d of June, 1849, the Britannia tower on the rock in the center of the strait was completed (height, 191 ft. 6 in. above high-water mark). Other two towers, some 18 ft. lower, were erected on each side of the Britannia tower; thus dividing the space into four spans, of which the two center ones are 460 ft. each, the other two being comparatively narrow. The short tubes between the abutments and the short towers were constructed, by means of strong scaffolding and stages, in the places they were to occupy when finished; the long central tubes were built at the water-edge, from whence they were floated off on pontoons to the base of the towers, which had grooves or recesses made to receive them, and then elevated gradually (supports being built under their ends as they ascended) by powerful hydraulic presses to the requisite height, 102 ft. above high-water mark. On the 13th of Oct., 1849, the first long tube, 472 ft. in length (12 ft. being allowed for the rest at both ends), and about 1800 tons in weight, was safely fixed at its proper height above the sea. The other center tube was got up by Dec.; and on the 5th of Mar., 1850, a train swept through, and the bridge was open for traffic. In Aug. the parallel line of tubes was completed, and the up and down trains could now pass over the Menai with as little delay and danger as over any other part of the line. The total length of the bridge is 1841 ft., of the tubes, 1513 feet. The extreme height of the tube at the Britannia tower is 30 ft., diminishing to 22 ft. 9 in. at the abutments, "the difference being made to give a true parabolic curve to the top while the bottom is straight." Inside, the width is 13 ft. 8 in. throughout, and the height 26 ft. at the middle, and 18 ft. 9 in. at the ends. To provide for the expansion and contraction of the metal, the bed-plates in the shore towers and in the abutments, on which the tubes rest, are made to move freely on cast-iron rollers and balls. This precaution, for securing free movement to the tubes, was not unnecessary, as it has been found that between the expansion of summer and contraction of winter there is a difference of fully 12 inches. The total weight of iron used was nearly 12,000 tons, of which the tubes contain 9360 tons of malleable iron, 1015 tons of cast iron, and 175 of permanent railway. In their fabrication 186,000 different pieces of iron, fastened together by more than 2,000,000 rivets, were used; and in the towers, abutments, etc., there is 1,492,151 cubic feet of masonry. The total cost was about £602,000. The whole structure was completed in 1850. See **TUBULAR BRIDGE**. See *illus.*, **BRIDGES**.

BRITANNICÆ INSULÆ, a term used by ancient classic writers previous to Cæsar for the British isles, including Albion (England and Scotland), and Hibernia or Ierne (Ireland), with the smaller isles around them. Aristotle, in the beginning of the 3d c. B.C., knew only of Albion and Ierne. Cæsar, about 54 B.C., was the first to apply the name Britannia to Albion. Ptolemy, in the 2d c. A.D., is the first to apply Little Britain to Ierne or Ireland, and Great Britain to Albion or England and Scotland. Herodotus, in the 5th c. B.C., is the first writer to mention Britain with any sort of definiteness; previous Greek writers speak of Britain only in connection with the Phœnician tin trade carried on with the Cassiterides or Tin isles (the Scilly isles and Cornwall), which they often confound with the Azores. The Phœnician trade with the British isles began about 1000 B.C., the Phœnicians giving the native Britons salt, skins, and bronze vessels in exchange for tin and lead. Ptolemy enumerates 52 different Celtic or Gaelic tribes as inhabiting Britain in his time. See **CELTIC NATIONS**.

BRITANNICUS, son of the emperor Claudius by Messalina, b. 42 A.D. He was the natural successor to Claudius, but after his mother's execution (when B. was eight years old), Agrippina, the new wife, persuaded Claudius to pass by B. and adopt her son by previous marriage with Lucius Domitius. This son was the emperor Nero; and soon after his accession, Pallas, one of Agrippina's lovers, who had been banished, threatened a revolt, and roused Nero's fear that B. might displace him; so B. was poisoned and died on his fourteenth birthday.

BRITISH AMERICA. See **AMERICA, BRITISH**.

BRITISH ARMY. In **ARMIES, MODERN**, a succinct account is given of the relative strength and organization of the chief European armies, but a more extended treatment of that of the British empire will be given in the present article.

Like other modern armies, the British army originated in the feudal system (q.v.). When regal power, tempered by a parliament, superseded that system, the people, according to their rank in life, were expected to provide themselves with certain kinds of weapons and defensive armor. The justices of the peace were empowered to see to these military duties of the people. When the nation was either actually engaged in war, or apprehensive of invasion, the sovereign issued commissions to experienced officers, authorizing them to draw out and array the fittest men for service in each county, and to march them to the sea-coast, or to any part of the country known to be in most danger. See **ARRAYER**. It was in the time of Henry VIII. that lord-lieutenants and deputy-lieutenants of counties were first appointed as standing-officers for assembling and mustering the military force. During the earlier years of the Tudors, contracts were made by the king with "captains," who undertook to provide, clothe, and feed so many fighting-men, for a given money-allowance; but the power intrusted to the lord-lieutenants gradually changed this system, in relation at least to home-defense. In the reign of Charles I., the important question arose, whether the king of England did or did not possess the right to maintain a military force without the express consent of parliament? and this question was all the more bitterly discussed when the king billeted his soldiers on the people. After the troubles of the civil wars and the commonwealth, Charles II. found himself compelled to agree, on his restoration, to the abandonment of all the army except a kind of body-guard or household brigade of 5000 men, sanctioned by the parliament. In the 13th year of his reign, he succeeded in obtaining a statute, declaratory that "the sole and supreme power, government, command, and disposition of the militia, and of all forces by sea and land, and of all forts and places of strength, is the undoubted right of his majesty; and both or either of the houses of parliament cannot nor ought to pretend to the same." Both Charles II. and James II. found, however, to their mortification, that this statute did not in effect give them so much real military command as they had wished and intended—because the commons, by holding the purse, virtually held the power.

The real basis for the modern B. A. was laid in the time of William and Mary; the declaration of rights (see **BILL OF RIGHTS**; **RIGHTS, DECLARATION OF**) providing "that the raising and keeping of a standing army in time of peace, without consent of parliament, is contrary to law." The first mutiny act (q.v.) was passed in 1689, to last for six months only; but it has been annually renewed ever since, except in three particular years; and it constitutes the warrant on which the whole military system of England is exercised by the sovereign, with the consent of parliament. Since then, with only three interruptions, the ministers of the crown have annually applied to parliament for permission to raise a military force, and for money to defray the expenses. The sovereign can make war, and can bestow military employments and honors; but the commons, as the representatives of the tax-paying nation, provide a check on the grasping by courtiers of military privileges. The law on army regulation has been revised, and the B. A. made the subject of special legislation in the army discipline bill passed in 1879.

The great distinction between the B. A. and that of almost every other state in Europe, is that the service is *voluntary*. The subjects of the crown engage, by free choice, to serve in the army for a definite number of years. In the rare cases where forced service by ballot is obtained, it is in the militia, not the regular army. See **MILITIA**. The British soldier has much hard colonial life to bear, and many long voyages to make; he is, moreover, almost entirely shut out from the chance of being a commis-

sioned officer. As a consequence, the ranks are mostly filled from the more necessitous classes of the community—by those who from want of steady habits, or of education, are the least fitted for industrious pursuits; whereas in France and many other foreign countries, the profession of arms is regarded as an honorable one, of which even the private soldier feels proud. Mr. De Fonblanque, comparing the peace establishments of the chief European armies in 1857, found that of England to be the smallest in ratio to population, but the most costly in relation to its strength. The English ratio was 1 in 128; the French, 1 in 95; the Prussian, 1 in 80; the Russian, 1 in 72; the Austrian, 1 in 68. An English private soldier costs the country £52 per annum; French, £26; Prussian, £31; Austrian, £18 10s.; Russian, £13 5s. The English cost per man is still higher now than it was in 1857, on account of increased attention being paid to the well-being of the soldier.

The B. A., in all its completeness, is supposed to be commanded by the sovereign, assisted by the secretary of state for war in some matters, and by the officer commanding in chief in others. The component elements are the household troops; the infantry of the line; the cavalry of the line; the ordnance corps, comprising artillery and engineers; other bodies of native troops, maintained out of the revenues of India; the militia; the yeomanry cavalry; the reserve; the volunteer artillery and rifles; and sometimes during war, foreign legions. The “peace establishment” of the B. A. varies according to the political aspect of affairs abroad, and to the strength of the economizing principle at home. In 1814, when England was engaged in tremendous contests abroad, the regular army reached 200,000 men, exclusive of fencibles, foreign legions, and militia. In the first few years after the termination of the great war against Napoleon, the reductions in the B. A. involved the compulsory retirement of no less than 10,000 military officers, who thereupon went on half-pay; these, by filling vacancies, transfers, and deaths, have nearly disappeared. The elasticity which permits the enlargement or contraction of the army arises from varying, not so much the number of regiments, as the number of battalions in a regiment, of companies in a battalion, or of men in a company. If we compare the strength of the regular army at various periods between 1820 and 1890, we shall find that the actual number of regiments has varied but little, the difference of strength being made up in the three modes just mentioned.

The strength of the B. A. declined from 1815 to 1835, since which last-mentioned year it has increased. These augmentations have been occasioned partly by the contests in China, India, Kaffraria, Persia, the Crimea, Afghanistan, and Zululand, and partly by a sense of insecurity amid the vast armaments of the continent. In comparing the strength of the forces at different periods, much confusion is apt to arise from different modes of interpreting the words “British army.” This designation may include the whole of the royal troops in India, whether supported out of imperial or of Indian revenues; it may include the militia, the volunteers, the yeomanry cavalry, the foreign legions—or it may exclude any one or more of these. The “British army,” and the “military force of the British empire,” are often treated as convertible terms: to the production of much confusion where actual numbers are given. In the following table, relating to the official year 1896-7, it is shown of what component elements the B. A. now consists. The militia and the volunteer corps are not here included.

ARMY ESTIMATES FOR 1896-7.

	United Kingdom.			Indian.	
	Officers.	Non-com. Officers, Drummers, etc.	Rank and File.	European Army.	Native Army.
Cavalry.....	553	1,368	11,396	5,679	23,295
Artillery.....	870	1,959	20,457	13,306	4,523
Engineers.....	584	1,264	5,641	359
Infantry.....	2,804	6,655	79,587	53,746	113,541

Totals.....	6,934	14,487	127,953	74,036	145,565
Total United Kingdom.....				149,374	
Total European Indian.....				74,036	
Total Native Indian.....				145,565	
Total British Army.....				368,975	

The House of Commons, by an annual vote, determines the number of troops and the cost of maintaining the different branches of the service. At the beginning of every session Parliament passes an act known as the Army Bill, investing the Crown with extensive powers for regulating the army and with the right to frame the Articles of War which form the military code. The administrative control over all the army services is in the hands of the secretary of state for war, aided by under-secretaries of state and by the heads of the principal departments. These principal departments are those of the commander-in-chief, adjutant-general, quartermaster-general, inspector-general of fortifications, inspector-general of ordnance, whose heads constitute a board presided over by the commander-in-chief. This board reports on the proposed estimates for the army, which the secretary of state lays before Parliament, and on promotions, appointments and other matters affecting the administration of the army. Its members under the presidency of the secretary of state, and with such additional military officers as they choose to summon, constitute the war office or council. A large part of the regular force is maintained in the United Kingdom. On January 1, 1896, the number of officers and privates maintained for service there was 107,636.

In addition to the regular troops there are four classes of reserves, i. e., the Militia, the Yeomanry Cavalry, the Volunteer corps, and the Army Reserve force, which when added to the regular forces, home and colonial and on Indian establishments, made the total effective force of 715,683 in 1895-6. The two leading institutions for the instruction of officers are the Royal Military College at Woolwich and the Royal Military and Staff College at Sandhurst. The total amount for maintaining the military services in 1895-6 was £18,053,800.

BRITISH ASSOCIATION, an association whose object is, by bringing together men eminent in all the several departments of science, to assist the progress of discovery, and to extend over the whole country the latest results of scientific research. A prevailing impression that England had fallen behind other countries, both as to the general estimation in which scientific men were held, and the prosecution of science itself, led to its formation. It was thought that an imposing union of men of science with the nobility, gentry, and clergy might tend to revive the philosophic spirit of the country. Such meetings had already taken place in Germany, and probably suggested the idea of this institution. Many leading men of the age took part in its formation, but the honor of being its founder must be ascribed to sir David Brewster. By his exertions the first meeting of those who were favorable to the design was held at York in the year 1831. The archbishop of York, the mayor and council of the city, entered warmly into the project. At this meeting the constitution of the society was determined, the several sections had their provinces assigned to them, and subjects were proposed on which reports were to be drawn up and read at the ensuing meeting. This took place at Oxford in 1832. The university had cordially welcomed the new association, the papers which were read gave it at once the high character it has since sustained, and from this date it may be said to have been in complete and successful operation. An enumeration of the several sections of the society, each of which has its own committee and president, will show the wide range of topics it embraces: Section A., mathematical and physical science; B., chemistry; C., geology; D., zoology, botany, anatomy, and physiology; E., geography and ethnology; F., economic science and statistics; G., mechanical science; H., anthropology.

At the close of each meeting, it is determined at what town in the United Kingdom the next shall be held, and a president of the whole association is appointed, who delivers an inaugural address, in which he is expected to present a general survey of the latest advances of science. The rules and by-laws of the society it is not necessary here to particularize; but it should be mentioned that the subscriptions of a continually increasing membership have placed at its disposal a large fund, which has been expended in the prosecution of science. In many cases, as in long astronomical calculations, or extensive meteorological observations, the labor of subordinates is required, and a certain apparatus, and it is in defraying such expenses that the funds of the B. A. are very wisely employed. The A. met at Montreal, Canada, 1884.

Besides the immediate ends sought to be obtained by such an association, its utility will be evident if we reflect on the intimate connection that exists between the several branches of science, and the impossibility there is that any one mind can be thoroughly conversant with them all. He who now hopes to make discoveries in science must limit himself to a few chosen studies; and yet such is the interlacing of all the several branches of inquiry, that he must often find it indispensable to know the last results of each. The botanist or the physiologist must consult the accomplished chemist; the chemist must call in the aid of those who have specifically studied the action of heat, light, and electricity; the geologist needs them all, and is in turn consulted by all. Thus, a certain brotherhood of science is formed, in which each has his specialty, and yet each leans upon his brother.

In ancient times it was otherwise. The facts on which a philosopher speculated were those which lay open to the eyes of all. A Thales could see the rain fall and plants grow, and forthwith pronounced that the vital energy of all things was to be found in

water. He could exercise his imagination in perfect independence of the labor of all other men. The philosopher of modern times cannot move a step without a careful consideration of the theories of his predecessors and contemporaries; he has to take notice of the innumerable facts brought to light by various observers, aided by those artificial arrangements which convert observation into experiment.

Two classes of men, of the most opposite character, are greatly aided by an association such as this. The humble and plodding workmen are taught where their patient industry will most avail; they are cautioned against re-discoveries; they are told where their love of collecting or experimentalizing may be best applied. And that other class of men, who love to generalize, who ever seek to embrace all the multifarious facts of science under a few great laws—these are provided with the very last intelligence from every department of inquiry, and may forthwith proceed to weave it into their own comprehensive scheme. Nor are we to overlook the benefit which the whole community derives from the rapid dissemination of the latest results or speculations of philosophy. Not only do the idle and fashionable, as well as the manufacturing towns and the universities, welcome the meetings of the B. A., but from this *Parliament of Science* the utterance of scientific opinion goes forth over the whole kingdom through the agency of the press. There is an American association, meeting in the various towns of the United States, and since 1872 there has been a French *Association pour l'Avancement des Sciences*.

BRITISH ASSOCIATION UNITS. See ELECTRICITY.

BRITISH BURMAH. See BURMAH.

BRITISH EMPIRE. See GREAT BRITAIN and IRELAND.

BRITISH GUM, DEXTRINE, or LEI'OCOME, is a substance extensively employed by calico-printers and others for the thickening of colors, instead of the much more expensive gum arabic. It is prepared from potato-starch (q. v.) or sago-starch by passing the grains through iron cylinders at a temperature about 500° F. It differs from starch in giving no blue color with tincture of iodine, and in being readily soluble in water, and thus yielding a thick liquid resembling in consistence mucilage (strong solution of ordinary gum). B. G. is the material which is produced by baking in the crusts of loaf-bread (q. v.), and which communicates to them their very agreeable taste.

BRITISH MUSEUM. The British Museum, an important national institution in London, originated in a bequest of Sir Hans Sloane, who, during a long lifetime, gathered an extensive and, at the time, unequaled collection of objects of natural history and works of art, besides a considerable library of books and manuscripts. These, in terms of his will, were offered, in 1753, to the government, on condition that £20,000 should be paid to his family, the first cost of the whole having amounted to more than £50,000. The offer was accepted; the necessary funds were raised by a lottery; and the collection, along with the Harleian and Cottonian libraries, were arranged in Montague House, which had been purchased for £10,250. The new institution, thenceforth called the British Museum, was opened in 1759. From time to time, purchases and donations succeeded each other rapidly. Montague House sufficed for the reception of all these acquisitions, till the Egyptian antiquities arrived in 1801. The purchase of the Townley marbles, in 1805, necessitated the erection of a gallery for their reception. This, however, did not meet the increasing demand for space. The old house was condemned, and plans were prepared by sir R. Smirke for new buildings; but none were undertaken till 1823, when the eastern wing of the present building was erected for the reception of the library of George III., which had been presented to the museum by George IV. The subsequent progress of the works was very slow. The building was completed in 1847. It is a hollow square, whose sides are opposite to the four points of the compass. Throughout the exterior of the building, the Grecian Ionic is the order of architecture adopted. The principal front is towards the s., facing Great Russel street, and presents an imposing columnar façade, 370 ft. in length. The great entrance-portico, in the center, is composed of a double range of columns, 8 in each range. The columns are 5 ft. in diameter at their base, and 45 ft. in height. The tympanum of the portico is ornamented with an allegorical sculpture by Westmacott, typical of the progress of civilization. On either side of the museum, there is a semi-detached house, containing the residences of the chief officers of the establishment. These give an additional length of 200 ft., making the whole length of the structure 570 feet. The interior of the building is admirably adapted to the purposes for which it is devoted. Some of the galleries, from their size and dimensions, have a very imposing appearance, as the king's library, the bird gallery, etc. The grand entrance-hall is a noble and lofty apartment, built in the massive Doric style: it contains a statue of sir Joseph Banks by Chantrey, and an ideal representation of Shakespeare by Roubilliac.

Scarcely had Smirke's plans been carried out, when demands were made from several of the departments for more accommodation. Additions have accordingly been made, rooms having been provided for the print department, and several new galleries for the recent acquisitions of antiquities; but the most important addition is the mag-

nificent reading-room which has been erected in the internal quadrangle. In no department of the museum was additional accommodation more needed than in the library. The number of readers had increased beyond the means of accommodation, and so short of space were they for books, that the estimates for purchases were restricted to only the half of the sum which the trustees considered desirable, for the sole reason that the library would be inadequate for the reception of extensive additions. After considerable delay, and the consideration and rejection of several plans, nothing was done till Mr. Panizzi, at that time keeper of the printed book department, suggested a plan which promised to meet the important requirements of speedy erection and economy in cost. The plan was at length adopted, and the result is a building than which none are better, few perhaps so thoroughly adapted to the purposes for which it is intended. Parliament voted the first grant for it in 1854. It was opened in 1857. The total cost was about £150,000, which includes the fittings and furniture, and the necessary shelves for immediate use. The building was erected in the interior quadrangle, which it completely occupies, with the exception of an interval of about 28 ft. all round, necessary for lighting and ventilating the surrounding building. The reading-room is circular. It is constructed principally of iron, with brick arches between the main ribs. The dome is 106 ft. in height, and its diameter 140 ft., being second only to the pantheon of Rome, and that but by 2 feet. The use of iron has economized the space to an extraordinary degree, for while the piers which support the pantheon fill 7477 ft., those on which the reading-room rests occupy only 200 feet. Equally remarkable has been the saving of space in the fitting up of the library. The shelves are formed of galvanized iron plates, edged with wainscot, and covered with leather, and are supported on malleable iron standards. In all the cases except against the external walls, the bookcases are double, a lattice of ironwork being fixed for the longitudinal separation of the books. Thus, throughout the whole interior of the new building, walls are dispensed with, the divisions being in all cases formed of the double ranges of books. The building contains 3 m. lineal of bookcases 8 ft. high. Assuming them all to be spaced for the average octavo book size, the entire ranges form 25 m. of book-shelves, and would accommodate 1,000,000 such volumes. In addition to this, the dome-room, which is the reading-room, has accommodation for 60,000 volumes. This magnificent room contains ample and comfortable accommodation for 300 readers. Each person has a space of 4 ft. 3 in. long. He is screened from the opposite occupant by a longitudinal division, which is fitted with a hinged desk, graduated on sloping racks, and a folding-shelf for spare books. In a recess between the two are placed an inkstand and penholders, thus leaving the table unincumbered. By an ingenious contrivance, one part of the iron framework is made to distribute fresh air in the summer and heated air in the winter. The vitiated air is conveyed through apertures in the soffits of the window, into one of two separate spherical and concentric chambers which extend over the whole surface of the roof, and escapes through outlets around the lantern. The other chamber, between the external covering of copper and the brick vaulting, has for its object the equalization of temperature, during extremes of heat and cold out of doors. Every modern improvement, in short, has been applied, when it could be serviceable, for the comfort or convenience of the readers. Much praise is due to the architect and builder, but a larger share is owing to the late sir A. Panizzi, who not only supplied the original design, but daily, almost hourly, superintended the progress of the work, continually suggesting little improvements, and in the end producing a room which is admired by all especially those who daily use it.

This building, while supplying amply the demands of the printed book department, did nothing, to meet the requirements of the other departments. Various schemes were suggested; the best, and perhaps in the end, the cheapest, plan of securing the ground immediately around the museum, was given up, and the trustees then resolved to erect a building to be devoted entirely to natural history—that is to say, to the departments of botany, zoology, geology, and mineralogy—on the site occupied by the international exhibition of 1862. Parliament voted in the year 1873, £80,000 for this purpose, and a beginning was made by the contractor. The whole cost of the new building very nearly reached the sum of £400,000. This elegant new terra-cotta building, situated in the Cromwell road, near South Kensington Museum, was designed by Mr. Alfred Waterhouse. The building at Bloomsbury has recently been enlarged.

Contents.—At first, the contents of the museum were arranged under three departments—printed books, manuscripts, and objects of natural history. Under the last head were included the antiquities, works of art, etc., comprised in the Sloane Collection, their number being too scanty to entitle them to constitute a separate department. The progress of the museum has caused a more precise division of its contents. From time to time, the number of the departments has been increased, so that, instead of three, there are now eleven: printed books (with maps), manuscripts, prints and drawings, oriental antiquities, Greek and Roman antiquities, coins and medals, British and mediæval antiquities and ethnography, zoology, botany, geology, and mineralogy. In noticing the contents of the museum, we shall refer to them in this order. We can but allude here to the most important portions of the collection, and must refer for more particular information to works specially devoted to this subject; such as the various handbooks and catalogues prepared by the officers of the museum.

Printed Books.—This is the largest department in the museum. It occupies the whole of the ground floor on the n. and e. sides, the new building erected in the quadrangle, and a considerable portion of the basement of the museum. The keeper of the department has the help of 3 assistant-keepers and 43 assistants. There are in addition 54 attendants.

The original bequest of sir Hans Sloane consisted of 50,000 volumes. When these were placed in Montague House, a small collection of 2000 volumes, bequeathed to the nation by Maj. Edwards in 1738, was added to them. In 1757, George II. presented the library of printed books which had been collected by the kings of England since Henry VII., and which included the libraries of Cranmer and Casaubon. He also annexed the important privilege, which the royal library acquired in the reign of queen Anne, of being supplied with a copy of every publication entered at Stationers' Hall. By this means the library has been supplied with the current British literature without expense or trouble, and the trustees have been able to devote the funds of the museum to the purchase of the earlier literature of the country and foreign publications. Among subsequent additions to the library may be mentioned the voluminous collection of pamphlets, etc., relating to the civil wars of England between 1640 and 1660, presented by George III.; the musical libraries of sir J. Hawkins and Dr. C. Burney; Garrick's collection of old English plays; Dr. Bentley's collection of the classics, annotated by his own hand; the law library of F. Hargrave; sir J. Banks's valuable and extensive collection on natural history; and a large mass of tracts and pamphlets relating to the French revolution, purchased from J. Wilson Croker, and of very great value. The most important addition was made in 1823, when George IV. presented the splendid library that had been collected by his father during his long reign, at an expense of little less than £200,000. This library, which, from the terms of the gift, cannot be mixed with the general collection, occupies a large and handsome hall, extending along the whole of the ground floor of the eastern side of the museum. It is undoubtedly the finest and most complete library ever formed by a single individual. "It contains," says sir H. Ellis, "selections of the rarest kind, more especially works of the first ages of printing; it is rich in the early editions of the classics; in books from the press of Caxton; in the history of the states of Europe; in the languages of the respective countries; in the transactions of academies; and in a grand geographical collection." The magnificent library of the right hon. Thomas Grenville, in importance second only to the king's library, was bequeathed to the museum in 1846. It consists of 20,240 volumes, which cost upwards of £54,000. In the same year was obtained also the extensive collection of Chinese works, amounting to 11,509 volumes, which belonged to Robert Morrison. By purchases, bequests, and donations, the library has become one of the first in the world, containing now over 1,500,000 printed volumes. See LIBRARIES. But even this figure, large though it is, does not represent the immense collection of separate and distinct articles in tracts, pamphlets, and manuscripts. The British Museum library is (with the exception, perhaps, of the national library of Paris) the largest collection of printed literature in the world. Since the opening of the new reading-room, and the consequent acquisition of the book accommodation, the want of which long hindered the proper increase of the library, the rate of increase has been enormous. During the year 1880, there were added 27,543 volumes, including music and volumes of newspapers, of which 2379 were presented, 15,361 purchased, 8857 acquired by home copyright, and 941 by international copyright. The number of parts of volumes was 39,873. In addition, the library had accumulated numerous broadsides, and miscellaneous articles variously obtained. The numbers of the pieces of music alone added were 5911 complete works, besides 1790 parts and numbers of works in progress. The total number of articles received during the year amounted to 76,774. In 1886, 33,844 volumes were added.

A catalogue of the printed books, in 7 octavo volumes, was published in 1813-19. So great have been the additions to the collection since the publication of that catalogue, that in 1880 the general MS. catalogue occupied upwards of 2000 folio volumes. At the end of 1887, 169 printed volumes had taken the place of 633 in manuscript, and it is calculated that the beginning of the 20th century will see the whole of the catalogue represented by some 6000 printed volumes. The adoption of printing has also facilitated the commencement of a subject-catalogue of all new acquisitions, and the first instalment of this was issued in 1886. Another important catalogue issued by this department is that of English books published previously to 1641, a work of the highest bibliographical importance. Here also are copies of the catalogue of the books of reference, arranged around the wall of the room, to which the readers have free access without the intervention of an official. These books, forming a library of 20,000 volumes, have been carefully selected to represent all the different branches of knowledge. The facility of consultation has been increased by the employment of different colors in the binding, corresponding to the colors of a hand catalogue scattered throughout the room. Thus theological works are bound in blue, historical in red, philosophical in green, and so on.

The right of access to the library is easily obtained. Any person desiring it, is "to apply in writing, addressed 'To the principal librarian of the British Museum,' and not otherwise, specifying his description and place of abode, and accompanying his letter with a written recommendation, satisfactory to an officer of the museum." Formerly,

the right of admission was granted only for six months at a time, and had then to be renewed. Under the new regulations, the ticket, once granted, does not require renewal; it can, of course, be withdrawn, and is not granted to persons under 21 years of age. When the reader has become well known to the officials, he is not even asked to show his ticket. The number of readers in 1886 was 176,893.

Maps.—The maps, charts, plans, and topographical drawings were separated from the library, to form a distinct department, in 1867. There are over 50,000 published and 20,000 manuscript maps in the museum. Many of the latter have thrown much light on the history of early geographical discovery.

Manuscripts.—The manuscripts are contained in several rooms in the s.e. angle of the building. The work of the department is carried on by a keeper, assistant-keeper, a keeper of oriental manuscripts, and nine assistants. The manuscripts are for the most part bound in volumes, and placed in cases around the rooms. The collection consists of: 1. The Sloanean manuscripts, relating chiefly to medical and natural history subjects. 2. The Cottonian manuscripts, rich in documents referring to the history of Britain, including two of the originals of *Magna Charta*, in registers of English monasteries, and in original letters of royal and illustrious personages. This collection contains the *Durham Book*—a copy of the Latin Gospels, with an interlineary Saxon gloss, finished in the year 720. 3. The Harleian manuscripts, a collection rich in illuminated manuscripts, in ancient, civil, and ecclesiastical records, in manuscripts of the classics, among which is one of the earliest known copies of the *Odyssey*, and in early English poetry. 4. The manuscripts of the ancient royal library. These were collected by our kings, from Richard II. to George II.; many of them were obtained from the monasteries, on their destruction. Amongst the most valuable treasures here are the *Codex Alexandrinus*, a manuscript of the Bible written in uncial Greek, before the close of the 5th c.; and the *Basilicon Doron* of James I., in his own handwriting. 5. The Lansdowne manuscripts. This collection comprises the Burghley and Caesar papers, the manuscripts of Bishop Kennett, and numerous valuable historical documents and state papers. 6. The Hargrave manuscripts, almost exclusively connected with law. 7. The Burney manuscripts, containing a large collection of the Greek and Latin classics. Among them is a copy of the *Iliad*, answering that of the *Odyssey* in the Harleian collection. 8. The Howard-Arundel manuscripts, obtained from the royal society. This collection is singularly rich in materials for the history of our own country and language. 9. The Oriental manuscripts, a collection composed of several purchases and bequests. It includes the manuscripts acquired by Mr. Rich while consul at Bagdad, and consists of numerous Syriac, Arabic, Ethiopic, and other oriental codices. A large series of Ethiopic manuscripts was obtained at Magdala, on the occasion of the Abyssinian war. 10. Additional manuscripts. This collection consists of innumerable bequests, donations, and purchases, which from the establishment of the museum have been and are still being acquired. Among recent additions may be specified a charter of William the Conqueror; the original mortgage-deed of a house in Blackfriars, dated 11th Mar., 1612, and signed by William Shakespeare; the holograph manuscript of Scott's *Kenilworth*, and of many of Burns's poems, including the *Cotter's Saturday Night*, and the songs published in Johnson's *Scots Musical Museum*; an extensive series of papal bulls; several *Books of Hours*, including the famous *Bedford Missal*; and a large collection of original letters and papers relating to the affairs of Scotland during the 16th and 17th centuries. Catalogues of the complete collections have at different times been published. The additions to the ever-increasing oriental and additional collections are at intervals published in supplements to each of the original catalogues. Copies of all these, with manuscript lists of the annual additions, are placed in the reading-room for consultation.

Supplementary catalogues were printed up till 1853; since then the additions have been kept up in manuscript catalogues. A general class catalogue, embracing all the collections, has been commenced, and the printing of it has begun. The first part is a catalogue of ancient and illuminated manuscripts, illustrated with photographic *fac-similes*, of which several volumes are published.

The right of using the reading-room includes the privilege of consulting the manuscripts. During 1880, the number of deliveries of manuscripts to readers in the reading-room amounted to 29,239. To artists and others in the rooms of the department, 6000 deliveries were made. These numbers do not include the volumes exhibited to visitors on private days.

Prints and Drawings.—The collections of this department, managed by a keeper and two assistants, are kept in rooms in the n.w. angle of the building. They consist of prints and drawings bequeathed to the museum, in 1799, by the Rev. C. M. Cracherode; of those bequeathed in 1824 by Mr. Payne Knight; and of numerous smaller bequests and donations. No purchases were made for this department until about 1840, when a sum was first included in the estimates for this purpose. Since that time, the prints and drawings have been increasing at a rate equal to any of the other departments of the museum. The collection is arranged in *schools*. 1. The Italian school, containing original drawings by Leonardo da Vinci, Raphael, Correggio, Tintoretto, Paul Veronese, Michael Angelo, Guido Reni, Salvator Rosa, and others. 2. The German school, containing drawings by Albert Dürer, Hans Holbein, Dietrich, Hollar, and others; and

engravings by Lucas Cranach, Martin Schon, Gauer, and others. 3. The Dutch school, containing several superb originals of Rubens, an extensive and nearly complete set of the works of Rembrandt, with many drawings by A. Cuyp, Teniers, Van Dyck, etc.; and engravings and etchings by Berghem, Lucas van Leyden, Rembrandt, Ostade, etc. 4. The French school, with drawings by Watteau, Claude Lorraine, etc., and etchings and engravings by Bourdon, Boisseaux, Le Prince, etc. 5. The Spanish school, represented by some drawings of Murillo, and others of less note. 6. The English school, containing drawings by R. Wilson, Wilkie, Stothard, Callcott, Gibson, etc.; a splendid collection of Hogarth's prints, and specimens of the works of Barlow, Gaywood, Raimbach, Finden, Worlidge, Geikie, etc. 7. Specimens of Japanese art.

This department contains also an extensive and very valuable collection of works in niello; a beautiful silver cup, designed and carved by Benvenuto Cellini, and a wonderful stone-carving in alto-relievo by Albert Dürer, representing the birth of St. John.

Oriental Antiquities.—Within the last ten years the objects in the museum, included under the name antiquities, have been divided into four departments. The first of them includes the Egyptian and Assyrian antiquities. The Egyptian monuments date from a period as remote as 2000 years before the Christian era, and come down to the Mohammedan invasion of Egypt, 640 A.D. The collection has been obtained chiefly from these sources: the antiquities which fell into the hands of the British army at the capitulation of Alexandria, presented by George III.; presents from Gen. Vyse, the duke of Northumberland, the marquis of Northampton, sir Gardner Wilkinson, and others; and acquisitions from the earl of Belmore, Mr. Salt, and M. Anastasie. The sculptures are formed of granite and basalt; they represent human and allegorical figures, sometimes of colossal size. There are several beautifully sculptured sarcophagi. Most of the monuments are inscribed with hieroglyphics (q.v.). The key to this dead and forgotten language was furnished by the celebrated Rosetta Stone (q.v.), which is placed in the center of the gallery. The smaller Egyptian remains are exhibited in a gallery on the upper floor; they consist of objects relating to religion, as representations of divinities and sacred animals, in wood, metal, stone, and porcelain; of objects relating to civil and domestic life, as dress, personal ornaments, household furniture, artistic and writing implements, armor, and weapons of war, etc.; and of objects relating to death and burial, as mummies and coffins, with the scarabæi, amulets, and other ornaments found with them. A collection of papyri is exhibited on the n.w. staircase, containing extracts from the ritual of the dead.

The Assyrian antiquities are contained in a suite of rooms recently erected on the outside of the Egyptian gallery, and in a spacious room on the basement. The collection consists of sculptures excavated at Nimrud, Khorsabad, and Koyunjik by Layard, in 1847-50, and more recently by Rassam and Loftus, under the direction of sir H. C. Rawlinson. The Nimrud sculptures are the oldest, belonging to a period ranging from 930 B.C. to 747 B.C. Those obtained from Khorsabad seem to have been executed under a monarch who reigned about 747-721 B.C., while the collection from Koyunjik belong to the time of Sardanapalus, apparently 721 B.C. and 625 B.C. The monuments consist chiefly of slabs of gypsum, alabaster, and limestone sculptured in low relief, the subjects being the exploits of the king whose palace walls they ornamented. Many of the sculptures are covered with cuneiform (q.v.) writing, which, by the labors of Rawlinson, Hincks, and Smith, has been deciphered, giving us a history of this remarkable people, and corroborating the narrative of the sacred Scriptures whenever they refer to the same event. See ASSYRIA. Besides the series of sculptures, the Assyrian collection includes a variety of smaller but highly curious and instructive objects, discovered at Nimrud and Koyunjik.

Greek and Roman Antiquities.—This collection occupies four apartments, which run parallel to the Egyptian gallery. The Lycian gallery contains a series of architectural and sculptural remains from ancient cities in Lycia, obtained by sir C. Fellows in 1842-46. In a new gallery are the remains of the famous mausoleum (q.v.) at Halicarnassus, erected in honor of Mausolus by his widow Artemisia. These remains were discovered by C. T. Newton, esq., in 1857-59. In another room are some remains of the temple of Athene Polias at Priene, including the stone on which its dedication by Alexander the great is inscribed. The Elgin gallery contains the sculptures from Athens and Attica, the greater portion of which were obtained by the earl of Elgin, and purchased from him by parliament in 1816 for £35,000. The most important series in the gallery is the decorations of the parthenon (q.v.), which, notwithstanding their dilapidated condition, form the most valuable monument of Greek art which has descended to modern times. The gallery contains also sculptures and casts from the temple of Wingless Victory, the temple of Theseus, and the erechtheum, at Athens. In an extension recently made to this gallery, are a colossal lion from Cnidus, and a drum of a sculptured column, and other remains, from the temple of Diana at Ephesus. The Helenic gallery contains a number of antiquities brought from Greece and its colonies at different times. The most important are 23 slabs of a frieze sculptured in mezzo-rilievo, which, from the locality where they were found, are called the "Phigalian marbles."

The gallery on the s. side of the building is occupied with the Roman and Græco-Roman sculptures. The bulk of the collection was formed by Charles Townley, esq., and purchased in 1805 for £20,000. Subsequent additions have been made by the bequest

of the collection of R. P. Knight, esq., in 1824, and by various purchases and donations. The collection contains an interesting series of Roman portrait sculptures, and a very extensive mythological series, amongst which are some of universal fame—the Venus, Clytie, the Discobolus, and many others. A room on the basement is appropriated to mosaics and miscellaneous monuments, such as representations of animals, architectural and decorative fragments, and sacred and domestic implements. A fine collection from southern Italy, exhibiting specimens of the arts of the Etruscans, Greeks, and Romans, was bequeathed to the museum by sir William Temple in 1856. The former reading-room of the department of prints is now occupied by a collection of Greek and Roman sepulchral monuments.

The collections of smaller remains are placed in a suite of rooms on the upper floor. They consist of—1. An extensive series of vases, commonly though not correctly known as Etruscan, formed from the collections of sir W. Hamilton and Mr. Burgon, from purchases at the sales of the prince of Canino, M. Durand, and others; and from excavations in Sicily, Rhodes, and on the sites of Greek colonies in Cyrene and elsewhere. 2. A miscellaneous collection of terra-cottas, mural paintings, and other objects. 3. Bronzes of Greek, Etruscan, and Roman workmanship, consisting of sculptures, and various domestic and other articles, as candelabra, lamps, vases, horse-trappings, armor, etc. 4. The collection of engraved gems and gold ornaments now, since the addition of the Blacas and Castellani collections, perhaps the richest in the world.

Coins and Medals.—The very large collection of these objects is arranged in chronological order under five great divisions, viz., Greek, Roman, Mediæval and Modern, English, and Oriental. The department is under the care of a keeper, assistant-keeper, and four assistants.

British and Mediæval Antiquities and Ethnography.—The British collection is arranged in chronological order. The oldest series contains the antiquities of the stone and bronze periods, consisting of celts, daggers, swords, shields, and early pottery. The British-Roman antiquities comprise specimens of earthenware, lamps, and miscellaneous articles. A small collection of sepulchral urns, weapons, and personal ornaments represents the Anglo-Saxon period. The antiquities found in London, and belonging to the late C. R. Smith, have been recently added to this collection. The ethnographical collection contains antiquities, as well as objects of modern use, belonging to all nations not of European race.

In 1855, the extensive collections of antiquities and ethnography, belonging to Henry Christy, became the property of the museum, having been bequeathed by their proprietor, and these are now exhibited in the former Bird Gallery. Felix Slade bequeathed his valuable collection of glass to the museum, and it is now arrayed so as to show the different phases through which the art of glass-blowing has passed, as well as the history of glass in all its branches.

Natural History.—In 1856 the trustees united the natural history departments under prof. Owen, who was then appointed superintendent of natural history. The building erected at Kensington in 1881 is intended to accommodate this section of the present museum.

Zoological Department.—To give an idea of the contents of this and the other natural history departments, would be to write an epitome of the various sciences they illustrate. This department contains a collection of animals arranged in systematic order in the galleries, comprising stuffed mammals, birds, reptiles, and fishes, and the hard portions of radiate, molluscan, and articulate animals. A room is specially devoted to the fauna of Britain. In rooms on the ground and basement floors are arranged the collections of insects, of osteology, and of specimens preserved in spirits. An idea of the extent of the collection may be formed from the fact that 142 separate publications, illustrative of the contents of the department, in the shape of catalogues, lists, etc., have been issued under the superintendence of the present indefatigable keeper, Dr. Gray. Later additions are the magnificent Gould Collection of humming-birds and the Walsingham Collection of birds and birds' nests. In 1873, the unique and extensive collection of birds formed in the eastern archipelago by Wallace, was acquired by purchase. In 1880, 24,283 specimens of animals were added.

Botanical Department.—The herbarium of sir H. Sloane, the nucleus of this collection, consisted of about 8000 species, bound in 262 volumes. In 1820, the magnificent herbarium of sir Joseph Banks was bequeathed to the museum, and under the superintendence of the late Robert Brown, was transferred to two rooms prepared for it in the s.e. angle of the building. The collection has since been rapidly increasing: during the year 1880, some 9000 species of plants were added. In the year 1873, the late William Wilson's herbarium of British and foreign mosses was acquired by purchase. The collection contains an extraordinary number of typical specimens—the identical plants from which the original descriptions were taken by Linnaeus, Aublet, Jacquin, Brown, Bentham, Bennett, and others. The exhibition rooms contain a series of specimens illustrating the most striking characteristics of the great divisions of the vegetable kingdom, arranged in order; and a series of fossil plants, the value of which is increased by the transparent sections showing their structure, which are placed beside them.

Geological Department.—This collection occupies the wall-cases of the principal gallery on the n. side of the museum. It contains an extensive series of the fossil remains of plants and animals from the various fossiliferous strata; it is especially rich in the

fossils of the secondary formations. Amongst its more valuable contents may be mentioned the collections of Dr. Mantell, the tertiary fossils collected by Dr. Falconer in India, and the remarkable fossil birds from New Zealand.

Mineralogical Department.—The minerals are contained in the table-cases in the geological gallery. They are arranged according to a chemical classification. Many valuable and unique specimens exist in the collection, which is rapidly increasing.

The expenses of the museum are paid by grants of public money. According to the estimates, £110,949 were required during 1879–80; £147,385 during 1887–88.

Admission to the museum was at first obtained by printed tickets, which were delivered by the porter to persons making a written application. There could be no more than 45 visitors, at the utmost, per day, under the regulations then in force. Now, all who present themselves are freely admitted; and every week-day the museum is visited by large numbers: as many as 43,000 holiday-folk have passed through the building in one day. During the past few years exhibitions have been given in the king's library, in connection with the centenaries of Luther, Handel, etc., and arrangements have been made for temporary exhibitions of rarities.

BRITISH NAVY. Under NAVIES, MODERN, will be found a brief description of the chief navies belonging to the continent of Europe, and to the United States of America. The British navy is separately treated in this place.

While the Romans occupied Britain, they were obliged to maintain a fleet of war-vessels on the coasts, to protect it from the ravages of the Saxons, who were the pirates and buccaneers of those times. When the Romans had departed, and the Saxons became dominant, the coasts were infested by another naval power—the Scandinavian vikings. It was Alfred the Great who first established what may be called a navy in this island, consisting of efficient vessels well manned, for protection, and not aggression. Ethelred made the building of a ship a condition for holding a certain acreage of land. William the Conqueror strengthened the navy by the institution of the Cinque ports (q.v.). During the first three centuries after the conquest, we read of British fleets of 240,400, and even 730 sail—a proof that the vessels must have been very small even if there were no exaggeration of numbers. Until 1485, the fleets were collected just as wanted; but in this year, Henry VII. conceived the idea of a *permanent* navy, to be ready at all times. He built the largest ship of the age, the *Great Harry*. Henry VIII. pursued the course established by his father, and still further strengthened the navy by instituting the admiralty, the navy-office, the Trinity house, and the dockyards at Woolwich, Portsmouth, and Deptford. The *Henri Grace de Dieu*, the largest ship built by him, was of 1000 tons burden; but most of the vessels were high, unwieldy, and narrow, with the guns nearly down to the water's edge. The ships of the navy presented an aggregate tonnage of 12,000 tons at the period of Henry's death. Elizabeth made a large increase in the navy; but they were not all royal ships which were sent to struggle against the Spanish Armada. James I. made many improvements in ship-building, by encouraging a distinguished naval architect, Phineas Pett. Charles I., who built the *Sovereign of the Seas*, of 100 guns, was the first to group the royal ships into rates and classes. Cromwell brought up the navy to the strength of 154 sail, including a large number of two-deckers. Charles II. allowed it to fall into decay for a time; but his brother, the duke of York, who afterwards became James II., not only restored it, but brought it to a higher state of efficiency and strength than ever. When William of Orange became king of England, he found a navy carrying 7000 guns and 42,000 seamen; he built many additional ships, some with as many as 80 guns, and established Plymouth dockyard. Queen Anne succeeded to the possession of a fine navy; which at her death had increased to 198 ships, mounting 10,600 guns, with a tonnage of 157,000 tons. George I. attended to the navy chiefly in repairing the ships after a period of war, and in supplying a new armament. George II. greatly added to the number of ships, established a naval uniform, and increased the renown of the British navy during the war against Spain.

The long and eventful reign of George III. was especially distinguished by the achievements of the navy. When he came to the crown in 1760, he found himself in possession of 127 ships of above 50 guns, and 198 of 50 guns and under, manned by 70,000 seamen. These numbers, by building and by capture, were increased to 174 and 203 respectively, by the end of the American war. Throughout the European struggle, from 1793 to 1815, the B. N. exhibited a spectacle for vastness and achievements which had never before been equaled in any country. In the first nine years of this period, between 1793 and 1803, England lost by war 5 ships of the line and 46 smaller vessels; but she captured from the French, Dutch, Spaniards, and Danes, in various battles, 74 ships of the line and 519 smaller vessels; or rather, four fifths of this number were captured, and one fifth destroyed. Besides these, more than 800 privateers were taken and destroyed by the English. Of the total number of captures, 144 ships of war were at once converted into British ships, and added to the navy. When war recommenced in 1803, England had 189 ships of the line, and 781 smaller ships of war; during the next seven years, the seamen varied from 100,000 to 120,000, and in 1810 the number was raised to 140,000. At all times, many of the ships of the royal navy are unemployed or out of commission; but it frequently happened during that great war, that England had 450 liners, frigates, and sloops, besides smaller armed vessels, employed simultaneously. The conquered vessels added to the navy between 1803 and 1815 were upwards of 100 in number.

After the termination of the great European struggle, a large number of ships of war were put "in ordinary," or out of commission, and their officers placed on half-pay. In 1820, the vessels in commission, in ordinary, and building, comprised 127 ships of the line, 311 frigates and sloops, and 27 smaller vessels; but in this total of 465, there were only 113 in commission. In the 19 years that next followed, almost wholly years of peace, the total number of ships of the line, frigates, and sloops, decreased; the gun-brigs, schooners, and cutters increased in number; while the first germs of a new element, a *steam navy*, made their appearance.

The year 1839 must be viewed as a turning-point in the history of the British navy. Twenty-four years of peace had thrown the memory of warlike achievements into the background; and the house of commons had insisted on the lessening of those estimates which provide for armies and navies. It was now found, however, that both Russia and France had accumulated formidable navies. From that year to the present, the B. N., in common with the navies of other powers, has been undergoing a series of "reconstructions." First, ships of larger size, and carrying heavier guns, were built. These ships were of immense power in the days of wooden broadsides, but are now useless for purposes of war. The next stage, from about 1853 to 1859, was the conversion of our force from a sailing to a steam navy. This became the era of great steam frigates of about 5000 tons, and of heavy armaments in a few great guns, of which the *Mersey*, 36 guns, may be taken as a leading specimen. With the introduction of rifled guns, of force hitherto undreamt of, came the necessity for armor-plated sides. The fighting part of the navy (i.e., the line of battle) changed once more after 1860 to low-sided vessels, clad in thousands of tons of iron plates. The *Warrior* was the first ship so built in England, and she was followed by a whole squadron similarly protected. Guns, however, went on increasing in offensive power; and whereas 5-inch plates were at first thought sufficient, now 10-in., 12-in., 14-in., and even 22-in. plates are necessary to exclude shot. Such a vast weight of armor all over a ship would sink any vessel of moderate dimensions. The principle of turret-ships is therefore becoming predominant, in which the greater part of the vessel, clad in comparatively light armor, is under water, or only just visible above the surface. The earliest formidable turret-ship was the ill-fated *Captain*, which, in 1870, capsized in the Bay of Biscay, and entombed 600 brave seamen, with the inventor, Capt. Coles. The expenditure on the B. N. greatly increased between 1839 and 1875, on account of the changes just adverted to. In 1896 the B. N. consisted of 86 armored ships carrying 745 heavy guns and 2,122 light guns; 126 unarmored ships carrying 746 heavy guns and 2,220 light guns; 2 armored gunboats carrying 4 heavy guns and 11 light guns; 83 unarmored gunboats carrying 214 heavy guns and 216 light guns; 4 dispatch vessels carrying 12 heavy guns and 18 light guns. In addition to these there were 29 training, receiving, store ships, etc., carrying 118 guns, and 250 torpedo boats. The total number of guns, exclusive of those on torpedo boats was 6,426, divided as follows: ten guns of 80 tons or over, 94 guns of 40 to 80 tons, 116 guns of 20 to 40 tons, 1,488 guns of 4 to 20 tons, and 4,718 guns under 4 tons. The number of officers was 2,861 and 53,755 seamen. In the marines the officers numbered 728 and the soldiers 17,430, making a total active list of 64,774 men.

Further matters concerning the ships, armament, seamen, or officers of the British navy will be found under ARMOR PLATES; MACHINE-GUNS; NAVAL RESERVE; NAVAL SCHOOLS; ORDNANCE; SHIPBUILDING; TURRET-SHIPS.

BRITTANY. See BRETAGNE.

BRITTON, the title of the earliest summary of the laws of England in the French language, purporting to have been written by the command of Edward I. The compiler is unknown.

BRITTON, JOHN, an eminent English topographical and antiquarian writer, the son of a small farmer and village shopkeeper, was b. July 7, 1771, at Kingston-St.-Michael, near Chippenham, Wiltshire, and losing his parents young, received but a scanty education. Some short notices which he had contributed to the *Sporting Magazine* brought him into acquaintance with its publisher, Mr. Wheble, who employed him to compile the *Beauties of Wiltshire*, which he did in conjunction with a young literary friend named E. W. Brayley. They also prepared the *Beauties of Bedfordshire* in the same manner. B. afterwards issued a more elaborate work, entitled the *Architectural Antiquities of England*. One of the most important of his subsequent publications was *The Cathedral Antiquities of England*, 14 vols. fol. and 4to, 1814-35, with upwards of 800 nicely finished plates. His illustrated works, alone, number 87. He d. in 1857.

BRITZKA (Polish *brjreska*, diminutive of *byrka*, a freight-wagon), a long four-wheeled pleasure carriage, in use in Russia and Poland, so constructed as to give space for reclining at night, when used on a journey. The Polish britzka, employed also in Russia, has a pole, a body of wickerwork, and a leather top.

BRIVE, a t. of France, in the department of Corrèze, pleasantly situated in the midst of vineyards, and shut in by a fine circular avenue of elms, about 15 m. s.w. of Tulle. It has manufactures of woolen, cotton-yarn, etc. Pop. 15,000.

BRIXEN, a t. of Austrian Tyrol, at the confluence of the Eisack and the Rientz, 104 m. from Vienna by rail. It is a bishop's see, and has a cathedral, several monasteries, a theological seminary, and a gymnasium. There are iron and steel factories in the neighborhood. Nine miles away is the great fort of Franzensfeste, built in 1838. B. is mentioned in 901; it was walled in in 1038; was burnt in 1174, 1234, and 1445; in 1519,

it was stormed by the French, and in 1525 suffered from the rebellion of the peasants. Pop. '85, 4842.

BRIXHAM, a market-t. and seaport of Devonshire, England, beautifully situated on the s. side of Torbay, 5 m. s. from Torquay, and 22 m. directly s. from Exeter. The town occupies the sides of two hills, and is divided into two parts, called upper and lower B., the former consisting chiefly of a long straggling street. Some of the more recently erected parts of the town are well built, and contain good houses, but the older parts are mean. The prosperity of B. depends chiefly on its fisheries; it being the headquarters of the great Devonshire fishery of Torbay, in which many vessels are employed, Great quantities of fresh fish are sent to London, Bath, and Bristol. Considerable quantities of iron ore are raised in the neighborhood and shipped here. There is some shipbuilding, and the town is a much frequented seaside resort. B. has also a number of vessels engaged in the coasting and foreign trade, the foreign trade being chiefly with the Mediterranean. A cave discovered on Windmill Hill, in 1858, contained many remains of prehistoric animals and men. Near B. is a station of the South Devon branch of the Great Western railway. It was at B. that the prince of Orange, afterwards William III., landed, Nov. 4, 1688. Pop. '71, 4941; '91, 6224.

BRIZA. See QUAKING GRASS.

BRIZURE, **BRIZÉ** or **BRISÉ**, terms used in heraldry to indicate that a charge is bruised or broken.

BROACH, or **BROCHE**, an old English term for a spire springing directly from a tower without any intermediate parapet. Such spires are common in England, and in some places in Scotland, particularly in Fife.

BROACH, a t. in India. See **BAROACH**.

BROAD ARROW, a government mark, stamped, cut, or otherwise fixed on all solid materials used in her majesty's ships or dock-yards, and on government stores generally, in order to prevent embezzlement. The origin of the mark is obscure. Previous to the year 1698, the naval authorities prosecuted a dealer in marine-stores, for having in his possession certain stores bearing the B. A. of his majesty. The defendant allowed the evidence against him to go on, and when asked what he had to say, replied that it was *very curious* that the king and he, as a dealer, should both have the same private mark on their property! The receiver of stolen goods was acquitted, and this led to the passing of the act 9 and 10 Will. III. c. 41 (1698), which enacts that persons in possession of naval stores, or goods of any kind marked with the B. A., or other marks therein mentioned, and usually employed in marking naval stores for the navy, shall forfeit all such goods and £200, and also pay costs. The mark is for iron, wood, etc., what the color-thread is for sailcloth and ropes, which enables the government to identify the smallest piece of such articles.

BROAD-BILL. See **SHOVELER**.

BROAD-BOTTOM ADMINISTRATION, a name applied to the English ministry formed by Henry Pelham in 1744, because it professed to include all parties of weight and influence in the state in a grand coalition, and comprised no less than nine dukes—viz., Dorset, Newcastle, Montagu, Bedford, Grafton, Richmond, Argyle, Devonshire, and Bolton, the first seven of whom were of the cabinet. Besides the prime minister, Pelham, the other principal members of the cabinet were earls Gower and Harrington, the marquis of Tweeddale and lord Hardwicke. From this B. B. A. the particular adherents of Pulteney (newly created earl of Bath) and lord Carteret were carefully excluded. The ministry was dissolved in 1754, by the death of Pelham, though several of its original members had seceded long before.

BROADCAST, a method of sowing grain, which distributes it with some degree of uniformity over the surface. When the sowing is done by hand, the seed is carried in a bag at the left side, and is scattered with the right hand while the sower walks on with measured tread. The seed is afterwards covered with a harrow, or by dragging brush over it. Machines have been devised for sowing grain in this manner. The method of sowing by the drill is preferred by most intelligent farmers.

BROAD CHURCH, the name given to a portion of the Church of England which holds a position unidentified with either the High or the Low church party. The High Church branch holds rigidly to apostolic succession, maintains the divine right of episcopacy, and in general the sacramental view of the church and the Christian life; of this company are those known as "Ritualists," though not all who are High church would accept the name of Ritualists. (See **RITUALISM**.) From this section came those known some years since as "Puseyites." The Low Church section recognizes non-prelatical bodies of Christian believers as in some sense churches; in doctrine they are mainly Calvinists; they are often called Evangelicals. The Broad Church section is the latest of the three divisions, but has included a number of churchmen of high cultivation and talent, such as Dean Stanley, Canon Kingsley, Maurice, and others of note. The tendency of the Broad Church leaders is towards a liberal view both of Christian doctrine and church organization. Yet the High on the one hand, the Low on the other, and the Broad between the two subscribe to the same formularies, which they interpret

in differing senses, and from which they deduce opposite results. It should be understood that these names are used only colloquially for popular convenience, and are not accepted in either England or America as legitimate designations. They show tendencies.

BROADHURST, HENRY, b. Littlemore, near Oxford, England, 1840. The son of a journeyman stonemason, he was fourteen years old when he began to follow his father's trade. After a wandering life he settled down in London, 1866, became prominently identified with the Trades' union, was made sec. of the Trades' congress, in 1880 was elected to parliament from Stoke-upon-Trent, in 1885 from Birmingham, in 1886 from Nottingham, and in 1894 from Leicester; became under-secretary to the home office in 1886; and served on various commissions concerning working people.

BROAD MOUNTAIN, in the coal region, Carbon and Schuylkill cos., Penn. It is about 2000 ft. high and extends for 50 m. n.e. and s.w.

BROAD RIVER, a stream of North and South Carolina rising in the Blue Ridge, and joining with the Saluda, forming the Congaree. The city of Columbia is at the junction of the two rivers. The country around B. R. is exceedingly fertile and productive.

BROADSIDE, in naval warfare, is the simultaneous discharge of all the guns on one side of a ship of war. The fighting power of a ship is sometimes estimated by the weight of her broadside, i.e., the weight of all the shot and shell that can be fired off at once from one side or half of the ship.

BROADSIDE, or **BROADSHEET**, a variety of pamphlet, consisting of a single large sheet, printed on one side only, and without division into columns. The broadside flourished chiefly in England, but had been in use from the first invention of printing, for papal indulgences, royal proclamations, and like documents. Throughout western Europe about the middle of the sixteenth century, the broadside made a considerable figure in times of political agitation. In England, it was used chiefly for ballads, which soon became so popular that during the first ten years of Elizabeth's reign the names of no less than forty ballad-printers appear in the Stationers' Registers.

BROADSTAIRS, a t. in England $1\frac{1}{2}$ m. s. of North Foreland and 3 m. from Margate. It has a small pier built early in the 16th century, and an archway leading to the shore built in 1540. Near the pier is a chapel to the Virgin, in honor of which ships were once accustomed to furl their topsails as they passed. B. is a place of summer resort. Pop. 4300.

BROADSWORD is a sword with a broad blade, for cutting only, not for stabbing, and therefore not sharp at the point, like a sabre.

BROAD TOP MOUNTAIN, in Bedford and Huntingdon cos., Penn., 2500 ft. above the sea. It has large beds of bituminous coal.

BROADUS, JOHN ALBERT, D.D., LL.D., b. Va., 1827; educated in the university of Virginia; pastor of the Baptist church in Charlotteville, and in 1859 professor of New Testament interpretation and homiletics in the Southern Baptist theological seminary in Greenville, S. C. He was proficient as a Greek scholar, and published, among other papers, *The Preparation and Delivery of Sermons and Recollections of Travels*. D. 1895.

BROBDINGNAG, a mythical country described in Swift's *Gulliver's Travels*. The inhabitants of this wonderful country are represented as giants, about "as tall as an ordinary spire-steeple." Everything else is on the same enormous scale, whence the adjective *brobdignagian* has arisen as a synonym of gigantic. The name is frequently, though incorrectly, spelled *Brobdignag*. Swift wrote a mock letter from Captain Gulliver to his cousin Sympson, purporting to be dated April 27, 1727, but first published in 1735, in which complaint was made that Brobdingnag had been wrongly printed for Brobdingrag, but this was only a feint to mystify the public by a pretended solicitude for minute accuracy. See SWIFT, JONATHAN.

BROCADE. This term is used to describe a silken fabric on which a figure of any kind is formed by the threads of the warp or weft being raised by the heddles, or, more generally, by the Jacquard-loom, in such order as to produce the pattern required. The word has much the same application to silk textures that damask has to linen textures or to worsted textures for upholstery uses. See WEAVING and JACQUARD-LOOM.

BROCAGE. See BROKER.

BROCATELLE, a kind of imitation brocade (q.v.), made of cotton or silk and cotton.

BROCCOLI, a well-known and much esteemed garden vegetable, one of the many varieties which cultivation has produced of the *brassica oleracea*, the common kale or cabbage. B. is said to have been originally brought to Italy and other parts of Europe from the isle of Cyprus about the middle of the 16th century. Its name is probably of Italian origin. It differs little from cauliflower (q.v.), of which it may be considered a mere variety, having colored instead of white heads, and a deeper tinge of color in the leaves, being also more hardy, the character from which its chief importance is derived, as it can be readily obtained at seasons when there is no cauliflower in the open garden. It is perhaps inferior to cauliflower, however, in delicacy of flavor. There are many subvarieties, the number of which is, of course, continually increasing; and some of these

are preferred for early spring sowing, with a view to an autumn crop; others for later sowing, with a view to a crop in the following spring. The subvarieties differ in size, in their more cut or entire leaves, in the greater or less degree of color—generally purple—with which the leaves are tinged, in the more or less compact form of the whole plant, in the more or less green, yellow, or purple color of the head, etc. Some of the kinds of B. preferred for late sowing and spring use are known by the general name of cape B., the first of them being said—but on doubtful authority—to have been introduced into Britain from the cape of Good Hope. The mode of cultivation of B. pretty much resembles that of cauliflower, except as to the times of sowing and transplanting, and that it is generally—even in Scotland—sown in the open ground, and not in a hot-bed. A similar richness of soil is required. Various modes of protection in winter are adopted. In mild winters, protection is scarcely or not at all needed.

BROCCHI, GIOVANNI BATTISTA; an Italian geologist, 1772-1826. He studied at Pisa, and was professor of botany in 1802 at Brescia, but devoted himself chiefly to geology. In 1808, he was made inspector of mines for Italy. In 1823, he went to Egypt, and two years after, Mehemet Ali made him one of a commission to organize the kingdom of Sennaar. B. fell a victim to the climate at Khartoum. Among his works are *Treatise on the Iron Mines of Mella*; *Essay on the Physical Constitution of the Metalliferous Mountains of the Valley of Trompia*; *Mineralogy of the Valley of Fassa and the Tyrol*; *Fossil Geology of the Apennines*, etc.

BROCHURE, a French word (from *brocher*, to stitch), equivalent to the English word pamphlet (q. v.).

BROCK. See BADGER.

BROCK, SIR ISAAC, 1769-1812, b. in Guernsey; an English general, killed in the battle of Queenston, Canada. Not long before he had captured Gen. Hull (suspected of treason) and his forces. There is a monument to his memory on the west bank of the Niagara river.

BROCK, THOMAS, English sculptor, born in Worcester in 1847. He became a pupil of J. H. Foley, and afterwards his assistant, completing after Foley's death many of his works; among others the O'Connell monument in Dublin. The bust of Longfellow in Westminster Abbey was by him. He was elected an associate of the Royal Academy in 1883.

BROCKEN (*Mons Bructerus*, *Melibocus* of the ancient Romans), popularly known as the *Blockberg*, is the highest summit of the Harz mountains. It is situated in the province of Saxony, Prussia, about 20 m. w.s.w. of Halberstadt, and has an elevation of 3740 ft. above the sea. The mountain is very frequently veiled in mist and cloud-strata, and is celebrated for the phenomenon known as the *Brockengespenst* ("specter of the Brocken"), which is nothing more than the shadow of men, houses, or other objects thrown upon the misty eastern horizon by the light of sunset. (See *Gallery of Nature*, published by W. & R. Chambers.) In clear weather, a fine view is obtained from the summit.

BROCKHAUS, FRIEDRICH ARNOLD, the founder of the well-known firm of B. in Leipzig, and publisher of the *Conversations-Lexicon*, was b. at Dortmund, May 4, 1772. In 1802, circumstances led him to Holland, where, however, his business schemes did not prosper. He returned to Germany in 1810, and in the following year commenced business in Altenburg. Before this, however (in 1808), B. had purchased the copyright of the *Conversations-Lexicon*, which had been commenced in 1796, and he completed the first edition, with the addition of two supplementary volumes, in 1809-10. In 1812, a second improved edition of the work was commenced under the supervision of B. as editor. The peace of 1815 enabled B. to pursue prosperously his peaceful and civilizing career. In 1817, his business had so increased, that he found it necessary to leave Altenburg for Leipzig, where, in the following year, he commenced book-printing in addition to book-publishing. In the course of a few years, the *Lexicon* passed through six editions; it has now arrived at the thirteenth edition. Through all the enterprises of B. as a publisher, a zealous devotion to the cause of liberty and general enlightenment may be traced. He died Aug. 20, 1823. B. was not only an able and assiduous man of business, but distinguished for his literary culture, his knowledge of the world, and his numerous social accomplishments. He was also eminently patriotic, and furthered many literary undertakings, simply through a pure love of "fatherland."

The business was afterwards carried on by FRIEDRICH (b. 1800, d. 1865) and HEINRICH (b. 1804, d. 1874) and then by Heinrich's sons, Rudolf and Edward. Among the numerous publications issued by the house, may be mentioned the later editions of the *Conversations-Lexicon*, with an *Atlas*; the *Universal Encyclopædia*, by Ersch and Gruber; and the German *Penny Magazine*, founded in 1833.

BROCKHAUS, HERMANN, third son of F. A. Brockhaus, was b. at Amsterdam, Jan. 28, 1806; studied at Leipzig, Göttingen, and Bonn, and lived successively in Copenhagen, Paris, London, and Oxford. From 1848 till his death in 1877, he held at Leipzig the chair of ordinary professor of the Sanscrit language and literature. Among his several works on oriental literature may be mentioned the *First Five Books of the Large Collection of Fables, Kathā Sarit Sāgara, in Sanscrit and German* (1839); an edition of the drama *Prabodha Candrodāya*, by Krishna Misra, with Hindu scholia (1845); Nachschebi's Persian version of the *Seven Wise Masters* (1845); and (in 1854) the Persian text of the *Songs of Hafiz*. After 1856, he was editor of the *Universal Encyclopædia*. B.'s method of printing Sanskrit in Roman types is not generally adopted in Germany.

BROCKPORT, a village in Monroe co., N. Y., on the New York Central and Hudson River railroad and the Erie canal, 18 m. w. of Rochester; has manufactures of pianos, wheels, shoes, etc. There is a state normal school here. Pop. '90, 3742.

BROCKTON, a city in Plymouth co., Mass., settled 1700, a town 1821, a city 1881; on the Old Colony system of the New York, New Haven and Hartford railroad, 20 miles s. of Boston, and watered by the Salisbury river. Its manufactures are important, especially those of boots and shoes, shoe-pegs, lasts, mechanics' tools, rubber goods, etc., and granite of fine quality is quarried here. There are electric railroads to all surrounding towns, electric lights, national and savings banks, excellent schools, a public library, and daily and weekly newspapers. Pop. '90, 27,294.

BROCKVILLE, a town of Ontario, Canada, taking its name from Gen. Sir Isaac Brock (q. v.). It stands on the left bank of the St. Lawrence proper, about 40 m. below Kingston, and about 160 above Montreal. Originally its communications downward were interrupted by powerful and rugged rapids, which, however, are now either avoided by canals or overcome by steam. B. is on the Grand Trunk railway. Pop. '91, 8793.

BRODERICK, DAVID COLBRETH, 1820-59; b. Washington, an energetic uneducated man, in early life a stone-mason, who became a political leader in New York city. In 1849, he went to California, and in 1856 was chosen United States senator. In consequence of some plain words, B. was challenged by David S. Terry, a judge of one of the state courts, and fell in the duel which followed.

BRODERIP, WILLIAM JOHN, 1789-1859; an English writer on natural history. He studied law, practiced, edited law reports, and was for 34 years a metropolitan police magistrate; but his leisure was devoted to science, and he was a member of most of the important societies, and contributed to their *Transactions*.

BRODHEAD, JOHN ROMEYN, LL.D., 1814-73; b. Philadelphia; a graduate of Rutgers college, and a student at law, but after brief practice he turned his whole attention to American history, especially that concerning the early settlement of New York. In pursuit of this object, while connected with the United States legation in Holland, he thoroughly searched the archives at the Hague and elsewhere in that country, and in England and France. His great labor was rewarded by the collection of more than 5000 documents, more or less important, of which many had until then been unknown to historians. These papers were printed by the state of New York in several large folio volumes. In 1846, B. was secretary of legation in London, where he wrote the greater part of his *History of the State of New York*, the last volume of which was published in 1871. From 1853 to 1857 he was naval officer of the port of New York. He was a leading member of the New York historical and other societies in this country and abroad.

BRODIE, SIR BENJAMIN COLLINS, Bart., a distinguished surgeon, third son of the Rev. Peter Bellinger Brodie, rector of Winterslow, Wiltshire, was b. there in 1783. He studied under sir Everard Home at St. George's Hospital, to which he was, in 1808, elected assistant-surgeon, and afterwards surgeon. He had previously lectured both on anatomy and on surgery. In 1810, he was elected a fellow of the Royal Society, and in 1811 received their Copley medal for his physiological papers contributed to the *Philosophical Transactions*. In 1834, he was created a baronet, and he held the appointment of sergeant-surgeon to queen Victoria, as well as that of first surgeon in ordinary to the prince consort. He was made D.C.L. of Oxford in 1850; was president of the Royal Society; a corresponding member of the Institute of France, and a foreign member of other learned societies and academies in Europe and America. Author of *Lectures on Local Nervous Affections* (1837, 8vo); *Hunterian Oration*, 1837; *Lectures Illustrative of Subjects in Pathology and Surgery* (1840, 8vo); *Introductory Discourse on the Duties and Conduct of Medical Students* (1843, 8vo); *Psychological Inquiries as to Mental Faculties* (3d ed., 1856); an edition of his works with *Autobiography* appeared in 1865. He also contributed papers to several scientific journals. He died in 1862.—B.'s son, sir B. C. BRODIE, F.R.S., was in 1855 elected Aldrichian prof. of chemistry at Oxford. He died in 1880.

BRODY, a t. of Galicia, Austria, s situated on a swampy plain, surrounded by forests, about 58 m. e.n.e. of Lemberg. B., which was made a free commercial town in 1779, has a large trade in the agricultural produce of the country with Russia, Poland, and Turkey. Its chief manufactures are leather and linen; jewelry, manufactured goods, and colonial produce are imported by way of Odessa. The trade is almost entirely in the hands of the Jews, who form so large a proportion of the inhabitants, that B. has been called "The German Jerusalem." Pop. 90, 17,534.

BROG, or BROGUE, a rudely formed species of shoe, formerly in use by the aboriginal Irish and the Scottish Highlanders, and of which there were different varieties. See SHOES, SHOE-TRADE. The name has been applied to a modern kind of shoes, with some fanciful peculiarities.—The term brogue is also used to signify the peculiar pronunciation of English that distinguishes natives of Ireland.

BROGLIE, ACHILLE LÉONCE VICTOR CHARLES, Duc de, 1785-1870; a peer of France. The family was Piedmontese, but won distinction in the armies of France. The first marshal de B. served under Louis XIV.; his son reached the highest grade of

the French peerage; the second marshal commanded in the seven years war, was made a prince of the empire, and by Louis XVI. made commander-in-chief. He refused to serve under Napoleon, and died in voluntary exile. His son followed Lafayette to America, but soon returned, served on the staff in the republican army of the Rhine, was denounced, arrested, and guillotined, June 27, 1794. His injunction to his son (the subject of this sketch, then but 9 years old) was to remain faithful to liberty even though she were ungrateful and unjust. "His father murdered, his mother in prison, his property confiscated and plundered, the young de Broglie first appears in life in wooden shoes and a red cap of liberty, begging an assignat from the younger Robespierre." Yet he adhered to the cause for which his father died, and maintained through life the principles of 1789, seeming to have forgotten even his rank until reminded of it by a summons to the chamber of peers. Early in life he was one of Napoleon's council of state. With high rank, independent fortune, unblemished integrity, unflinching patriotism, and a sincere and consistent attachment to liberal opinions, B. entered the chamber in 1815, just before he was 30 years old. His first opportunity was on the trial of marshal Ney, and he alone had the courage to speak and vote for acquittal on the ground that the marshal was not guilty of premeditated treason. During the restoration he was active in the defense of liberal opinions and measures, opposing the reactionary policy of the court, and acting with the doctrinaires, of whom Guizot was the ablest representative. In 1816, he married Mme. de Stael's daughter. About the same time he became an ally of Clarkson and Wilberforce in the cause of the emancipation of negroes from slavery. In Louis Philippe's first cabinet he reluctantly took the bureau of public worship, and in 1832, upon strong urging, became Cassimir Perier's successor as minister of foreign affairs, in which office he strengthened the bonds between France and England, negotiated the quadruple alliance, assisted in settling the Belgian and Greek questions, and labored with success to preserve the peace of Europe. In 1835, he was the head of the cabinet, and, riding beside the king when Fieschi's attempt at regicide was made, B. received one of the bullets through his coat collar. He retired permanently from public life in 1836. Though not in office, B. preserved through life close personal and political friendship with Guizot. The overthrow of the constitutional monarchy in 1848 was a severe blow to the duke; but he consented to sit in the republican assemblies, and labored to counteract some of what he deemed to be the evils of universal suffrage and to avert the *coup d'état* which he saw was impending. When it came he was conspicuous as one of the bitterest enemies of the imperial regime, though he admitted that an empire was "the government which the poorer classes of France desired, and the rich deserved." His last 20 years were devoted to philosophical and literary pursuits. With regard to the future, he said: "I shall die a penitent Christian and an impenitent liberal." He was a member of the academy and other societies.

BROGLIE, CHARLES JACQUES VICTOR ALBERT, Duc de, son of Achille, b. 1821; statesman and author, elected a member of the academy in 1862. He was elected to the national assembly in 1871; was appointed ambassador to Great Britain in the same year; and was premier of France in 1873-4 and 1877. His main work, *The Church and the Roman Empire in the Fourth Century*, has passed through several editions. He has also published *Leibnitz's System of Religion*; *Questions of Religion and History*; *Pontifical Sovereignty and Liberty*; *Divine Liberty and Human Liberty*; *Frederick II. and Maria Theresa*; *Empress Maria Theresa*; *Maurice de Saxe and the Marquis d'Argenson* (1891); *Memoirs of the Prince de Talleyrand* (edited 1891); *An Ambassador of the Vanquished* (1896), etc.

BROGUE. See BROG.

BROHAN, JOSÉPHINE FÉLICITÉ AUGUSTINE, 1824-93; a French actress, excelling specially in the higher dramas, such as those of Molière, Beaumarchais, and Victor Hugo. She produced some pieces of her own. On the death of Rachel she took the great tragedienne's chair in the Conservatory. Her mother, Augustine Suzanne (1807-87) was distinguished in comedy, and her sister, Emélie Madeleine (b. 1833), was a talented and attractive actress; retired from the stage in 1885.

BROILING is a convenient and expeditious mode of cooking small pieces of meat, by laying them on a gridiron over a bright fire, or even on the coals themselves. This is perhaps the most primitive mode of preparing meat for eating, as may be supposed from the great ease and simplicity with which the operation is managed. B. is, in fact, a quicker sort of roasting. The albumen of the outside being sealed up at once, the meat is rendered extremely nutritious, and therefore this process is much to be recommended. But to broil meat so as to preserve its odor, juice, and fat, requires care. The meat should be prepared for the gridiron by being beaten slightly with the rolling-pin, trimmed of superfluous fat and skin, and cut so as to look well on the dish. The fire should be perfectly clear, and of a red-hot surface to answer to the size of the gridiron, that all parts of the meat may be equally cooked. Just before setting the gridiron over, some salt should be sprinkled on the fire to prevent the flare. The gridiron should be perfectly clean and smooth, being always rubbed when it is put away; and, before using, it should be warmed, greased with suet, and rubbed again with paper. When it is placed on the fire, the back should be higher than the front. The meat should never be touched with a fork, but turned rapidly with the broiling tongs; and when sufficiently done, should be served immediately on a very hot dish, being seasoned according to taste.

BROKE. Sir PHILIP BOWES VERE, 1776-1841; an English admiral of the war of 1812; he commanded the *Shannon*, and sent a challenge to fight to the American Capt. Lawrence, just promoted to the command of the *Chesapeake*. Before the letter arrived, Lawrence, who thought the mere appearance of a British vessel to be a challenge, went out to meet him. An action ensued, June 1, 1813, in sight of the land off Boston. Lawrence was almost immediately mortally wounded, and his badly supplied and badly manned vessel was captured. The victory raised B. to knighthood.

BROKEN KNEES. The part commonly termed the knee of the horse is the carpus or wrist of man, and from the peculiar conformation of a quadruped, is much exposed, and liable to serious injury. By *broken knee* is meant the abrasion or more serious injury of the joint by a fall; and even when the wounds are healed, the scar usually remains to indicate that the horse has once fallen, and is "broken-kneed." An animal is then regarded as unsafe, and seriously deteriorated in value.

Causes.—The fall is necessarily the immediate cause of the broken-knee; as to the cause of the fall, it is usually to be looked for elsewhere than in the horse himself. As a rule, the safety of a horse's action is very great, particularly about the age of from four to seven or eight years. Rarely does a horse at any age fall on his knees, unless his feet have suffered from improper shoeing; the animal then moves cautiously, and is very apt to "stumble." Undoubtedly, some horses of defective conformation and sluggish disposition are more likely to stumble and fall than a well made, high-actioned steed; nevertheless, the most perfect animal may gradually be rendered unsafe by improper shoeing. See SHOEING OF HORSES.

Symptoms.—It is important, so soon as the injury is done, to determine the extent and depth of the wound. If it be merely a superficial wound, the case is a simple one; and unless the skin is much bruised, the hair will grow, and the animal not be permanently blemished. The sheath, however, through which the tendon over the joint passes, may be opened, and the tendon itself injured. The wound is then gaping, heals rather slowly, and sloughs have to be thrown off. Lastly, the joint itself may be opened, and this is indicated by a free discharge of the joint-oil or synovia, and by the bones being seen or felt on probing. The worst form of accident is that when the bones of the joint are fractured. The system suffers when the wounds are serious, and severe fever sets in.

Treatment.—Whatever may be the form of injury, the first injunction is to wash the wound thoroughly with cold water applied constantly for hours. The joint will swell, become hot and painful, and in some cases irritative fever occurs. Then the animal should be kept on low diet, and be purged with four, five, or six drachms of aloes, according to its size, etc. Should the wound be deep, much dirt remaining in the tissues, a large linseed-meal poultice should be applied over the joint for a day or two, until free suppuration sets in. If this is retarded, and in all cases when the poultice does not appear necessary, cold fomentations may be continued, using either some infusion of chamomile, or one part of tincture of arnica to twelve of water, or one part of Goulard's extract to a similar quantity of water. The severe symptoms speedily subside, unless the bones are fractured or the joint otherwise seriously injured. Usually, the wound heals rapidly, the joint-oil ceases to flow; and in order to insure a contraction of the wound, mild astringent or caustic applications should be used, such as tincture of myrrh, sulphate of zinc lotion, or sulphate of copper in crystal rubbed over it. When the wound is thoroughly healed, the hair may not grow rapidly, even in parts where it should form; in this case its production may be accelerated by the use of a very mild cantharidine ointment, which should act as a mild irritant, but not as a blister. In some cases of severe broken knee, it is advisable to fix the limb so that the animal may not move the joint much. In veterinary jurisprudence, a broken knee is regarded as a *blemish*, not as an unsoundness.

BROKEN WIND, a disease or unsoundness of the respiratory organs of the horse, which, from the French *pousse*, was termed, by some of the old English writers on farriery, *pursiness*. The Germans term it *dämpfigkeit*, or asthma, though in many of their works it receives also the name of *herzschlagigkeit*, from a belief that it consists in palpitation of the heart. The nature of the malady is not well understood, though it appears in the form of difficulty in the act of expiration, the horse making an extraordinary or spasmodic effort to expel from the lungs the air which has readily entered them in inspiration.

Symptoms.—A broken-winded horse is usually an animal that does not thrive, is lean, and has a dependent belly, the muscles of which are unusually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised, the breathing becoming very labored, the nostrils dilated, the eyes bloodshot, and even blue, showing imperfect purification of blood in the lungs. On watching the chest and flank, the ribs are observed very actively moved, and after collapsing, when the air is expelled from the lungs, are further depressed by a spasmodic jerk brought about by the abdominal muscles. A broken-winded horse has a bad cough, of the kind referred to by veterinarians as characteristic of unsoundness, and termed a *hollow cough*. When the animal is oppressed by fast work, or dragging a load up a hill, the pulse is excessively rapid, and the heart beats energetically. From this circumstance, it is regarded by some as a disease of the heart. Others have believed the diaphragm affected, but in reality it is the lungs, or the apparatus for expelling the air from these organs, that is at fault.

The diaphragm being a muscle of inspiration, it is probably in no way implicated. No doubt, when the heart is diseased, the function of breathing is sometimes much affected, but these are not the symptoms of the true broken-wind, any more than when the lungs are in part rendered impervious to air, and the act of inspiration is rendered short. This condition constitutes *thick wind*, and is often one of the remote results of inflammatory disease of the lungs.

Causes.—Low-bred horses are liable to B. W., especially if improperly fed on innutritious and bulky food, and at the same time kept at hard and fast work. It is a dietetic disease, and is due to the irritation in the stomach, caused by indigestible food, being reflected from the nerves of the stomach to those of the lungs—in the same way as with ourselves, disease in one tooth seems to set all the other teeth aching. As a matter of fact the nerves of the stomach and lungs have a common origin, and consequently are easily affected one through the other. This indirect irritation causes firstly spasm, and later on relaxation of the little muscles around the air-tubes; consequently too much air gets into the lungs, and causes pressure on the walls of the air-vesicles, terminating in wasting and rupture of them. The result of the destruction of air-vesicles is a lessened area for the aëration of the blood, and is followed by debility and loss of condition. On post-mortem examination we find the stomach much distended with food of a dry nature, and its walls thinned. The lungs are lighter in color, and float much more buoyantly than in health; little or no blood is seen in them, but they contain a large quantity of air, which makes them crackle when pressed.

Treatment.—The treatment of B. W. is very unsatisfactory; and we can only hope for palliation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the horse the best hay in spare quantities—viz., from 10 to 12 lbs. daily. Some veterinarians have vaunted their powers of curing this disease, and recommended large doses of camphor, digitalis, and opium; but these potent narcotics only operate for a very short time, and as their effects pass off, the symptoms return, and often with increased severity. We may say that B. W. is incurable; and horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hemorrhage, or simple suffocation.

B. W. is so bad a form of unsoundness that horse-dealers sometimes attempt, and even successfully, to hide the defect for the time they may be engaged in the sale of a horse, and this they do by causing the animal to swallow *shot* or *grease*. A certain portion of lead weighing in the stomach has a wonderful effect in diminishing the symptoms, which become again obvious enough for a few hours after the ruse has been practiced on some unwary purchaser.

BROKER (so called, from a Teut. and Slav. root, *brak* or *wrak*, signifying refuse, blemish; as if the function had originally been to select good articles of merchandise and reject blemished ones; the German term is *mäkler*, from *makel*, blemish), an agent employed to make bargains and contracts between other persons, in matters of trade, commerce, and navigation, for a compensation commonly called brokerage. Where he is employed to buy or sell goods, he is not intrusted with the custody or possession of them, and is not authorized to buy or sell them in his own name. In this respect, he differs from a factor, and he differs from an auctioneer in two particulars: a B. may buy as well as sell, but an auctioneer can only sell; a B. cannot sell personally at public auction, for that is the appropriate function of an auctioneer, but he may sell at private sales, which an auctioneer (as such) does not. A B. is strictly a middleman, or intermediate negotiator between the parties, and for some purposes, he is treated as the agent of both parties, but primarily he is deemed merely the agent of the party by whom he is originally employed. There are several sorts of brokers, such as stock-brokers, share-brokers, ship-brokers (q.v.), insurance-brokers, and bill-brokers (q.v.). Persons who appraise goods, sell or distrain furniture for rent, are also called brokers, although differing entirely in their occupations from the preceding commercial agents. The business of a pawnbroker (q.v.) is also of a different nature.

Brokers in London, must be admitted by the lord mayor and aldermen, paying £3 on admission, and a like sum annually, under a penalty of £100; but they are no otherwise subject to the control of the court of aldermen. A list is kept by the city of brokers admitted, and of those who have been convicted of fraud or disqualified.

In the United States, brokers are classified according to the nature of their business. In general, the word means a dealer in money or stocks; but besides the bill and note broker there are exchange, insurance, cotton (and other merchandise), pawn, real estate, and ship brokers. The B. receives a commission on his sales, or by a special agreement. Usually brokers do not disclose the names of their principals. There is an implied warranty in dealing with a broker that the thing he sells is all that it pretends to be, and if a bill sold be found a forgery, he is held responsible.

BROKERAGE is the remuneration or compensation allowed to a broker (q.v.).

BROMBERG, a t. of Prussia, in the province of Posen, 69 m. n.e. from the city of that name, is situated on the Brahe, about 6 m. from its junction with the Vistula. B. has manufactures of woollens, linen, chicory, tobacco, and Prussian blue; a large sugar-refinery, distilleries, breweries, potteries, and corn-mills. The *Bromberg canal*, by unit-

ing the rivers Netz and Brahe, connects the Oder and Elbe with the Vistula. Pop. of commune, 1890, 41,399.

BROME, a co. in the province of Quebec, Canada, on the Vermont border; 350 sq. m.; pop. '91, 14,709. The Green mountains occupy a portion of the county. Co. seat, Knowlton. The Southeastern railway passes through the co.

BROME, RICHARD, a minor English dramatist, who died about 1652, was in early life a servant to Ben Jonson. At what time he began his literary career is unknown, but his reputation grew rapidly; he had as friends, Dekker, Ford, and Shirley, and Jonson wrote some lines commendatory of Brome's comedy, *The Northern Lass*. He wrote twenty-four popular plays, one of which, *The Jovial Crew*, revived in 1819, is ranked next to *The Northern Lass* in excellence. Fifteen of these plays were comedies, original in plot, and introducing some very striking and realistic characters. Other plays were *The Court Beggar*, and, in collaboration with Heywood, *The Lancashire Witches*. Two volumes of his plays were edited by Alexander Brome, a contemporary poet, but not related. See his *Dramatic Works* (3 vols., 1873).

BROME-GRASS, *Bromus*; Gr. *bromos*, a kind of oat; a genus of grasses, very nearly allied to fescue (q.v.), with flowers in lax panicles, glumes many-flowered, the outer palea bifid at the extremity, and awned beneath, and the very short stigma growing from the face of the germen, beneath its apex. The species are numerous, and some of them are very common British grasses—none more so than the Soft B. (*B. mollis*), an annual or biennial, which has very soft downy leaves, grows well on poor soils, and is readily eaten by cattle, but is not much esteemed by farmers, either for the quantity or quality of fodder which it yields. Its seeds have also the reputation of possessing deleterious or poisonous properties; and those of two other species of this genus, *B. purgans* and *B. catharticus*, the former a native of North America, and the latter of Chili, are said to be emetic and purgative. The whole subject of the existence of poisonous properties in the seeds of any of these grasses, requires further investigation. Soft B., although now disliked by farmers, was formerly sown as a fodder-grass, and its large seeds were even regarded as making hay more nutritious; so that there are some who view its present proscription as a thing which ought to be reconsidered, and who deem it not improbable that its weighty produce, both in foliage and seeds, and its adaptation to poor soils, may yet recommend it to the favor of agriculturists. Very similar to it are Smooth B. (*B. racemosus*), Field B. or Meadow B. (*B. commutatus* or *B. pratensis*, and *B. urvensis*), all of which seem very much to resemble it in their properties.—The Tall B. (*B. giganteus*, also known as *festuca gigantea* and *bucetum giganteum*), a native of Britain, which reaches the height of 4 or even 5 ft., affords a great bulk of foliage, but is not much relished by cattle. Naturally growing in shady places, it succeeds even in dense woods, and is sometimes sown to form covert for game.—Rye B. (*B. secalinus*) is generally regarded as a troublesome weed, especially in fields of rye. It is very abundant in some parts of Europe. In a young state it has a great resemblance to rye. Its seeds, which are large, retain their power of germination for years, and do not lose it by passing through the intestines of animal. Deleterious effects have been erroneously ascribed to bread made from rye, along with which these seeds have been ground.

BROMELIA CEE, a natural order of monocotyledonous plants, allied to *amaryllideæ* and *irideæ*, stemless, or with short stems, and rigid, channeled, often spiny and scaly leaves. The flowers are in racemes or panicles; the calyx 3-parted or tubular, persistent, more or less cohering with the ovary; the petals three, withering or deciduous, equal or unequal, imbricated in bud. The stamens are six, inserted into the tube of the calyx and corolla, the anthers opening inwards. The ovary is 3-celled, the style single, the fruit capsular or succulent, many-seeded; the seeds with a minute embryo lying in the base of mealy albumen.—The order contains about 170 known species, all natives of the warmer parts of America, although some of them are now naturalized both in Asia and Africa. The best known plant of the order, and the only one much valued for its fruit, is the pineapple (q.v.). B., with their strong spiny leaves, cover the ground in many places, so as to form impenetrable thickets. Many of them are epiphytic, or grow upon trees, without being parasites, particularly the species of *tillandsia*, one of which is the New Orleans moss, long beard, or old man's beard of the West Indies and of the southern parts of the United States, hanging from the trees like the lichens of colder climates. The leaves of some are so formed and placed as to retain near their base a quantity of water, often affording a delicious refreshment to the traveler in a hot climate. The water is, perhaps, of use to the plant itself in droughts. Not a few of the B. are capable of vegetating long without contact with earth, and of sustaining long drought without inconvenience, for which reason, and because of their beautiful and fragrant flowers, some of them are very frequently suspended from balconies in South America as air-plants. But the plants of this order are more generally valuable for their fibers than upon any other account. *Tillandsia usneoides*, the New Orleans moss already mentioned, yields a fiber, easily obtained, and in great abundance, which is used instead of hair for stuffing mattresses. The fibers of the leaves of the pineapple, and of some other species of this order, have been made into fabrics resembling the finest white muslin, whilst they are found also to possess sufficient strength for cordage. It is supposed that the produce of different species of *bromelia* is often included along with that of the American aloe or *agave* (q.v.), under the name of *pita* fiber or pita flax, the appearance and properties of

the fibers being very similar, as well as those also of the fibers of the species of *yucca*. The fiber of the pineapple is, in some countries, very frequently twisted into fishing-lines, and made into nets and into ropes intended for immersion in water, being very little liable to injury from this cause. Abundant as the plant is in its native regions, and now so perfectly naturalized as to form thickets in many parts of the old world, there seems no limit to the quantity of this fiber which might be procured.—The pineapple cloth of the Philippines is called *pina muslin* and *batiste d'ananas*. It is also sometimes erroneously called *grass-cloth*. "With a magnifier, the fibers may be seen to be very numerous and fine, but not twisted at all, as in grass-cloth or the finest muslins and cambrics." The Philippine pineapple fiber is obtained from a species called by the Spaniards *pigna* or *pina* (a cone), and which has by botanists been named *bromelia pigna*, although some regard it as a mere variety of the pineapple, with small and rather dry fruit. It grows in great abundance in the Philippine islands, and is cultivated by the Chinese near Singapore, and the fiber exported to China. This fiber is prepared also in Malacca, Java, Celebes, etc. The fruit of *B. pinguin*, the wild ananas, affords a cooling juice, which is used in the West Indies, mixed with water, for various ailments.

BROMIC ACID, HBrO_3 , is the best known compound of bromine and oxygen. It is prepared pure by acting on bromine, Br., with bromide of silver, AgBrO_3 , when bromide of silver and B. A. are produced. B. A. is a very unstable acid, being readily decomposed by reducing agents. It forms a whole series of salts called bromates, none of which are of importance. They are mostly crystalline, but their watery solutions readily decompose when evaporated. When heated, they liberate oxygen and form bromides (see BROMINE). Mixed with sulphur or charcoal, they explode by percussion, and in this and other properties resemble the chlorates. See CHLORIC ACID.

BROMIDES. Bromine combines very rapidly with most of the metals, occasionally so as to cause ignition, as in the case of antimony, and forms a class of salts usually known as B., though perhaps they are rather hydrobromides. (See HYDROBROMIC ACID.) Bromide of silver, which is very sensitive to the sun's rays, is used in photography. Bromide of potassium, which is the most important of the B., may be prepared by the action of bromine on solution of caustic potash. The whole is then evaporated to dryness and ignited along with charcoal. On solution in water and crystallization, the bromide is obtained in colorless, cubical crystals, possessing a pungent saline taste, and which are very soluble in water. This salt has been used in a very large number of diseases, owing to its powerful sedative properties. Other B. (such as those of sodium and lithium) are of comparatively little importance, although they possess similar medicinal properties. Hydrobromic acid combines with these the tonic effects of hydrochloric acid. In epilepsy, bromide of potassium affords relief. As a sedative in nervous excitement and sleeplessness, its use produces beneficial results, while in delirium tremens and tetanus large doses give relief. In excessively large doses, general depression, lowering of the temperature, and even death may result. The continued use of bromine compounds in large doses often leads to unpleasant effects (skin eruptions, low spirits, etc.), collectively termed *bromism*. See HYPNOTICS.

BROMINE (Greek, *bromos*, disagreeable smell: symb. Br; equiv. 80; spec. grav. 2.96), one of the chemical elements, occurs in combination in sea-water to the extent of about 1 grain to the gallon. It is found more abundantly in certain saline springs, especially those at Kreuznach and Kissingen in Germany. It is also present in water and land plants and animals. In the extraction of B. from concentrated sea-water, from which common salt has been separated in quantity, and which is then called *bittern*, or from salt springs, the liquor—which contains the B., as bromide of magnesium, MgBr_2 —has a stream of chlorine gas, Cl, passed through it, which forms chloride of magnesium, MgCl_2 , and liberates the bromine. The liquid thus becomes of a more or less yellow tint, and if it be then agitated with ether, and allowed to settle, the latter floats up the bromine. The ethereal solution is then treated with potash, which principally forms bromide of potassium, KBr, and fixes the B., so that the ether may be distilled off. The residue is then treated with oxide of manganese and sulphuric acid in a retort with heat, which results in the liberation and distillation of pure bromine. It exists as a deep red liquid of density 2.98 at 59° (15° C.), which evolves red fumes of a very irritating and suffocating nature. It is very poisonous, actually destroying the animal tissues. It is sparingly soluble in water, more so in alcohol and ether, and its water solution possesses great bleaching properties. When raised to the temperature of 145.4° F. (63° C.), it boils, and reduced to 9.5° (-12.5° C.), it becomes a red crystalline solid. B. combines with great rapidity with metals, occasionally with ignition, as with antimony, and forms a class of salts. Treated with hydrosulphuric acid, B. yields hydrobromic acid, HBr, which is the analogue of hydrochloric acid, as B. is of chlorine.

BROMLEY, a t. in England, 10 m. s.e. of London, on high ground n. of the Ravensbourne river. Besides modern institutions there is a college founded in 1666, by bishop Warner, for the residence and support of widows of clergymen. There is also a palace for the bishop of Rochester, to whom the manor has belonged since the time of Ethelbert; and in the garden attached is St. Blaize's well, which was of great fame before the reformation. Pop. of parish in '91, 21,685.

BROMSEBRO, a village of Sweden, in the län, and 27 m. s. of the town, of Calmar. It is celebrated as the place where treaties were entered into between Sweden and Denmark in 1541, 1641, and 1645.

BROMSGROVE, a market t. of Worcestershire, England, near the small river Salwarp, 12 m. s. s.w. from Birmingham. It is $1\frac{1}{2}$ m. e. from a station on the Birmingham and Bristol railway. The Birmingham and Worcester canal also passes near it. It is situated in a highly cultivated and richly wooded valley. The principal street is about a mile in length. There is a very flourishing grammar-school, founded by Edward VI. in 1553. The linen manufacture was formerly carried on at B.; button-making and nail-making are at present the principal branches of industry. Pop. '91, 7934.

BRONCHI are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra, the latter divides into two branches or B., of similar structure to itself—namely, round and cartilaginous in front; and flat, with muscular and fibrous tissue, behind, lined with mucous membrane. Of these B., one goes to each lung, the right being little more than an inch; the left, about two inches in length. On entering the substance of a lung, the B. divide into smaller branches, which again subdivide, until they are no larger in diameter than one-fiftieth to one-thirtieth of an inch, which give origin to, or terminate in, small polyhedral cells, which seem to cluster round their extremities, and open into them. These are the air-cells; they consist of elastic tissue, with a lining of mucous membrane, and beneath the latter, a layer of minute blood-vessels of the lung. See RESPIRATION, ORGANS AND PROCESS OF.

BRONCHITIS, or inflammation of the lining membrane of the bronchial tubes, is a disease of very common occurrence in this country, and one of the greatest importance for, if neglected, it not only destroys life, but if carelessly treated, may lead to premature and miserable old age. The first symptoms are generally those which distinguish a common cold—viz., shivering, headache, and sense of weariness, with occasional cough; but the cough continues, and recurs in paroxysms; there is a feeling of oppression on the chest, and the person *wheezes* when he breathes. He also breathes more rapidly, six or ten respirations in the minute more than he did when in health, and his pulse is quicker; and the ear applied to his chest, after these symptoms have continued for two or three days, will hear a rattling, as if air was bubbling through thickish fluid, which is the case; he is breathing through an extraordinary amount of mucus secreted by the inflamed lining membrane of the tube. During his paroxysms of cough, this mucus is spit up. If the inflammation extend no further, it is termed *tubular B.*, and is seldom a fatal disease in the first attack; but, as may be expected, it will often extend, or, in some cases, begin in the small tubes—*vesicular B.*—when the symptoms just described will be present, but in a greater degree, the breathing being so embarrassed that the patient can no longer lie down, but requires to sit or stand up, and use all his muscles of respiration. Though he coughs, he spits very little, till about the third day, when he expectorates large quantities of yellow fluid. At last, prostration becomes so complete that he ceases to spit, and dies suffocated by the accumulated mucus, from the fifth to the seventh day. In less severe cases, or those which yield to treatment, the delicate tubes may be permanently injured by the inflammation. They may be thickened, which narrows their caliber; this will prevent the proper passage of the air, and gives rise to wheezing on any exertion, and cough, especially in winter. Moreover, after repeated attacks, one of the tubes may be blocked up entirely, so that the portion of lung to which it ought to conduct air, is no longer filled, and consequently collapses and wastes. This compels the adjacent tubes and air-cells to dilate to receive more air at the expense of their elasticity (*emphysema*, q. v.); the air cells may even burst, and so by degrees the apparatus for aerating the blood becomes less and less perfect. The treatment of B. must vary with the patient's constitution; but in most cases, counter-irritation, applied through the medium of mustard or hot turpentine fomentations, will be found very useful. These remedies act more rapidly than a blister, and may be frequently repeated. It should be remembered that patients suffering from B. are very easily depressed. Such medicines as ammonia should be given, to promote expectoration, combined with the liquor ammoniæ acetatis, to produce perspiration. In very acute cases, after a brisk purge, salines, with ipecacuanha or squills, may be given, and an emetic will remove accumulations of mucus.

In the B. of old persons, chloric ether will be found very useful, and may be combined with sedatives, as henbane, but opium must be given with great caution, or not at all, as it tends to increase the congestion of the inflamed tubes. The pargoric elixir (compound tincture of camphor) is an old and popular remedy in B., but enough has been said to impress on the reader the danger of tampering with bronchitis. In every case where it is possible, a skilled medical man should be employed, to determine, by the stethoscope, not only the disease but its exact situation; and as it is but too likely to recur at some future period, or symptoms caused by it to appear, a skilled opinion has a permanent value to the patient. See CATARRH.

BRONCHO. The name given in the western and north-western states to an imperfectly broken mustang. The word is more properly spelled *bronco*, according to the Spanish form, and means "intractable," "rough," "stubborn." The name *cayuse* (from the Cayuse Indians) is also locally employed to designate the broncho.

BRONCHOCELE. See GOITER; THYROID BODY.

BRÖNDSTED, PETER OLUF, a learned antiquary, born near Horsens in Jütland, Nov. 17, 1780. On completing his course of studies at the university of Copenhagen, he, in 1806, went to Paris, where he remained two years. He afterwards visited Italy and Greece, where he made excavations which furnished valuable materials for the study of classical antiquity. He died rector of the Copenhagen university in 1842. B.'s principal work is *Travels and Researches in Greece* (2 vols., Paris, 1826). In addition to several smaller archæological papers, amongst which was one in English, entitled *An Account of some Greek Vases found near Vulci* (Lond. 1832), and another on the bronzes of Siris, which appeared at Copenhagen, 1837, B. also wrote some valuable contributions to Danish history from mediæval Norman manuscripts (2 vols., Copenh. 1817-18).

BRONGNIART, ADOLPHE THÉOPHILE, 1801-76; b. Paris; eminent botanist, and son of Alexandre, noted below. He studied medicine, and in 1826 received a diploma, but devoted himself particularly to plants and their physiology. In 1833 he became professor of botany at the Jardin des Plantes, Paris, and in 1834 a member of the Academy of Sciences, succeeding Desfontaines. In 1852 he was elected a foreign member of the Royal society of London. He published *Prodromus of a History of Fossil Vegetables* (1828); *Botanical and Geological Researches on Vegetables enclosed in the Different Strata of the Earth* (2 vols., 1828); *Observations on the Interior Structure of the Sigillaria Elegans*.

BRONGNIART, ALEXANDRE, an eminent French chemist and naturalist, born at Paris in 1770, is said to have delivered a lecture on chemistry before he was 15. In 1790, he visited England for a scientific examination of the Derbyshire mines and pottery-works, and, on his return to France, published a *Mémoire sur l'Art de l'Emaillleur*. Appointed in 1800 director of the porcelain manufactory at Sèvres, he held that office for the remainder of his life, and revived the almost lost art of painting on glass. In his *Essai d'une Classification des Reptiles*, 1805, he established the four divisions of reptiles, and first gave them the names of *saurians*, *batrachians*, *chelonians*, and *ophidiens*. His *Traité Élémentaire de Minéralogie*, published in 1807, at the instance of the imperial university, became a text-book for lecturers. In 1814, appeared his *Mémoire sur les Corps Organisés Fossiles nommés Trilobites*, a name which, as well as a basis of classification for those singular *crustacea*, naturalists owe to Brongniart. In 1815, he was elected a member of the academy of sciences of the French institute; he was also a member of the royal and geological societies of London, and of other learned bodies. In 1845, appeared his *Traité des Arts Céramiques*. He died Oct. 7, 1847.

BRONI, a t. of northern Italy, in the province of Pavia, about 11 m. s.e. of the town of Pavia, in a beautiful situation at the foot of the Apennines. It has a singular old church, some portions of which date from the 10th century. In its vicinity is the castle of Broni, celebrated in history as the place where prince Eugene obtained a victory over the French in 1703. Pop. about 5100.

BRONKHORST, JAN VAN, 1603-80; b. Utrecht, Holland; attained success as a glass painter, but in 1639 abandoned it for oil painting and etching.

BRONN, HEINRICH GEORG, a German naturalist, was born at Ziegelhausen, Mar. 3, 1800, and educated at Heidelberg university, where he devoted himself to the science of forests and natural history. In 1823, he commenced at Heidelberg a course of lectures on the physical and industrial sciences, and in 1833 was nominated ordinary professor of the same. After Leuckhardt's departure from Freiberg, B. was appointed to the zoological lectureship. B. wrote several important scientific treatises. His first was *A System of Antediluvian Conchylia* (Heidelberg, 1824), which was followed by *A System of Antediluvian Zoophytes*. In 1824, he visited the southern countries of Europe; and in 1827, made a second journey to Italy. On his return, he published the results of his journey (2 vols., Heidelberg, 1825-30). In 1834 appeared his most important geological work—*Lethæa Geognostica*; in 1841-49, his *History of Nature*; and in 1850, his *Universal Zoology*, which was the first attempt to develop zoology in its entirety with reference to extinct organisms. B. died in 1862.

BRONNER, JOHANN PHILIPP, 1792-1864; a German authority on wines, their nature and production, on which he published more than a dozen treatises. In 1831, he established a school for teaching wine-culture; and in later years, under a commission from Baden, he traveled and investigated in all the grape-growing countries of the continent.

BRONTÉ, a t. in the province of Catania, Italy, situated at the western base of Mt. Etna, about 22 m. n.w. of the city of Catania. B. has manufactures of woolen and paper, and the district produces oil, almonds, wine, etc. But the town is celebrated chiefly for its connection with admiral lord Nelson, who was created duke of Bronté by the Neapolitan government in 1779, with an annual income of 6000 *oncie* (or \$18,750), Pop. about 16,000.

BRONTÉ, ANNE, b. about 1820; d. 1849; English novelist, and sister of Charlotte Brontë. With her sisters she published a volume of verse in 1846, assuming the pen-name of Acton Bell; and in 1847 and 1848 published the romances *Agnes Grey* and *The Tenant of Wildfeld Hall*.

BRONTË, CHARLOTTE, one of the most distinguished of modern novelists, was born at Thornton, in the West Riding of Yorkshire, on the 21st of April, 1816. Her father, a clergyman of Irish descent, removed, with six young children and an invalid wife, from Thornton to Haworth, in the same county, in 1821. Soon after their arrival, Mrs. Brontë died, so that Charlotte, trying hard in after-life, could but dimly recall the remembrance of her mother. Her father, eccentric and solitary in his habits, and full of extravagant theories for making his children hardy and stoical, was ill fitted to replace a mother's love. When Charlotte was eight years old, she was sent with three of her sisters to Cowan's Bridge school, which, whether deservedly or not, had an unfortunate notoriety conferred upon it 25 years later in the pages of *Jane Eyre*. Her two eldest sisters falling dangerously ill, and dying a few days after their removal thence, and the low situation evidently disagreeing with Charlotte's health, she was sent home when little more than nine, and remained there, "the motherly friend and guardian of her younger sisters," till, in 1831, she was sent to Miss Wooler's school at Roe Head, where her remarkable talents were duly appreciated by her kind instructress, and friendships formed with some of her fellow-pupils that lasted throughout life. A few years later, she returned to Miss Wooler's school as teacher there, and also had some sorrowful experiences as governess in one or two families. It was with a view of better qualifying themselves for the task of teaching that Charlotte and her sister Emily went to Brussels in 1842, and took up their abode in a *pensionnat*. When Charlotte returned home in 1844, a new shadow darkened the gloomy Yorkshire parsonage. Her father's sight was declining fast, and her only brother was a source of continual anxiety. It now seemed plain that school-keeping could never be a resource, and the sisters turned their thoughts to literature. Their volume of poems was published in 1846; their names being veiled under those of Currer, Ellis, and Acton Bell, but it met with little or no attention. Charlotte's next venture was a prose tale, *The Professor*, and while it was passing slowly and heavily from publisher to publisher, *Jane Eyre* was making progress. In the Aug. of 1847, it was submitted to Messrs. Smith & Elder, and published by them two months later. It took the public by storm. It was felt that a fresh hand, making new harmonies, was thrown over the old instrument. Henceforward, Charlotte B. had a "twofold life, as author and woman." Over the latter the clouds closed thicker and thicker. Mr. Brontë had indeed recovered his sight; but the sister Charlotte so intensely loved, and whose genius she ever delighted to exalt above her own, Emily—the Ellis Bell of *Wuthering Heights*—died in 1848. Her only brother also died in the same year; and Anne, the youngest of the family, following in 1849, Charlotte was left alone with her aged father in that dreary deserted home among the graves. Nevertheless, her energy never flagged. *Shirley*, begun soon after the appearance of *Jane Eyre*, was published in the autumn of 1849; and *Villette*, written under the frequent pressure of bad health and low spirits, came out in 1852. In the spring of 1854, Charlotte B. was married to her father's curate, the Rev. A. Nicholls, who had long known and loved her. It is a relief to find that a little bright sunshine was permitted to the close of a hitherto clouded life. It was, however, but brief; for serious illness set in, and on the 31st of Mar., 1855, she died. A fragment of an unfinished novel appeared in the *Cornhill Magazine* for April, 1860. See Mrs. Gaskell's *Life of C. B.* (1857); Shorter's *Charlotte Brontë and her Circle* (1896).

BRONZE is a reddish-yellow, fine-grained alloy of copper and tin, in variable proportions. It was early known, and what is usually spoken of as *brass* in regard to the ancient nations, was in reality bronze. The brass or B. referred to in the Bible was probably composed of copper and tin, though some translators consider it likely to have been copper alone. The examination of the most ancient coins and metallic ornaments and implements leaves no doubt as to the acquaintance of the ancients with B.; so much so, that in the antiquarian history of European nations, there is a distinct period styled the *bronze period* (see next art.). At the present time, B. is largely used for house and church bells, Chinese gongs, ordnance or cannon metal, and speculum or telescope metal. In the preparation of the various kinds of B., great care must be taken to keep the tin from being burned away or wasted. To obviate this, it is customary to use much old B., as worn-out cannon, etc., and when that is fused in the furnace, to add the new copper and tin. The best Cornish and Banca tin are employed for the better kinds of castings, especially where strength of alloy is required. For inferior work, old scrap tin, which often contains lead, is used; and where strength of material is not an object, a little zinc and lead are added. In either case, during the fusion of the mixed metals in the furnace, at a high temperature, as little air as possible must be admitted to the furnace, otherwise the metals are oxidized, and the alloy is deteriorated. B., when well made, is, excepting gold, platinum, and some of the rare metals, the most durable metallic material with which we are acquainted; and this, coupled with its extreme hardness, rendering it difficult for time and ordinary wear and tear to efface inscriptions or medallions stamped on it, has led the mint in France, some years ago, to issue a bronze coinage in place of copper; and for the last twelve or fifteen years bronze coinage has taken the place of a copper coinage in Great Britain.

The principal varieties of B. have the following average composition:

	Copper. Tin.	
Brass ordnance or bronze cannon.....	9	1
Bronze for toothed wheels.....	10	1
“ for mathematical instruments.....	12	1
“ for bearings of machinery.....	8	1
Chinese gongs and cymbals.....	5	1
Musical bells.....	6	1
House bells.....	4	1
Large bells.....	3	1
Telescope or speculum metal.....	2	1
Mirrors.....	2	1
Hard bronze.....	7	1
Medium bronze.....	8	1
Soft bronze.....	9	1
Flexible bronze nails.....	20	1

Ancient.

Recently, B. has been deposited on small statues and other articles, in greater or less thickness, by the electrolyte process (see GALVANISM), forming very pleasing ornaments at a cheaper rate than ordinary B. ornaments can be purchased for. The same process has been suggested for coating those parts of machinery which are liable to rust.

BRONZE, AGE OF (Dan. *Broncealderen*), a term used by many modern archaeologists to distinguish the second of the three successive periods into which, as they hold, the primitive or pre-historic antiquities of a country may be divided. They take for granted that among a rude or savage people, stone, being more easily fashioned, would come into use before any kind of metal; and that of metals, copper, being oftener found ready for the hammer, would come into use before iron, which has generally to be smelted before it can be wrought. These assumptions—which, in so far, are only in accordance with what has actually been observed among uncivilized races—have obtained from a very early date. Lucretius, writing in the century before the Christian era, has recorded them with his usual vigorous precision:

Arma antiqua, manus, ungues, dentesque fuerunt,
Et lapides, et item silvarum fragmina rami:
Posterior ferri vis est ærisque reperta;
Et prior æris erat quam ferri cognitus usus.
De Rerum Natura, v. 1282.

Man's earliest arms were fingers, teeth, and nails,
And stones, and fragments from the branching woods;
Then copper next; and last, as later traced,
The tyrant iron.—*Mason Good's Translation*.

More than one antiquary of the last century appears to have suggested the distribution of archaeological objects into eras of stone, of copper or bronze, and of iron. But the proposed classification received scarcely any attention until about forty years ago, when it was adopted and developed by Mr. C. J. Thomsen, superintendent of the ethnographical and archaeological museum of Copenhagen, in his *Ledetraad til Nordisk Oldkyndighed* (Kjöbenhavn, 1836), and by Mr. Nilsson, professor of zoology in the university of Lund, in Sweden, in his *Skandinaviska Nordens Urinvonare* (Lund, 1838-43). According to the theory of these writers—which is held by almost all archaeologists in Denmark, Sweden, and Norway, by many in northern Germany and in Switzerland, and by a few in other parts of Europe—the first three stages in the progress of a nation from barbarism to civilization are as clearly identified and defined by their relics of stone, of bronze, and of iron, as the comparative antiquity of geological strata, or periods of the world's creation, is determined by the fossils which they are found to contain.

The name of the “age of stone” is given to the period when weapons and implements were made of stone, amber, wood, bone, horn, or some such easily wrought material, and during which very little or nothing was known of metals. During this era, the people, few in number, and savage in their habits, clothed themselves chiefly with skins of animals. They buried their dead in large sepulchral chambers, covered by what have been called *cromlechs*, or girdled round by the unhewn stone pillars called “Druidical circles.” The bodies have most frequently been found unburned, and often with rude urns beside them.

During the “age of bronze,” weapons and implements were made of copper or of bronze, and iron and silver were little or not at all known. The dead were burned, and their ashes kept in urns, or deposited in stone-chests, which were covered by conical mounds of earth or heaps of loose stones. In the urns, articles of gold and amber are found, but never of silver. Most articles of metal appear to have been cast; where marks of the hammer appear, it is contended that the forging or beating must have been done by a stone hammer upon a stone anvil.

The “age of iron” is the name applied to the third and last of the three supposed periods. During this era, it is conceived that iron displaced bronze in the manufacture of weapons and implements, and that silver and glass came into use. The dead were still occasionally burned; but they were frequently buried without burning, often seated on chairs, and, at times, with a horse in full war-harness laid beside the body of his master.

The Scandinavian and German antiquaries admit that their three periods run, more or less, one into another; that stone weapons continued to be used throughout the age of B.; that B. and gold were not unknown in the age of stone; and that weapons of stone and B. continued to be used in the age of iron. This admission obviously detracts very much from the practical value of the classification for chronological or other scientific purposes. But the late Mr. J. M. Kemble, and other British antiquaries, have taken objections to the classification altogether, as irreconcilable with generally admitted facts, when carried out to its strict and necessary consequences. They point to the every-day discovery of objects of stone, B., and iron, in the same ancient urns, graves, and dwellings. They instance the case of the Huns, who had swords of iron, while they pointed their arrows with bones; the case of the Anglo-Saxons, who fought with stone mauls at Hastings; and the case of the Germans, who used stone hammers in the thirty years' war. They show stone weapons, in some of which the traces of metal are still fresh, while others attest for themselves that they could not have been cut but by a thin sharp metal point.* They prove from Greek and Roman writers that the nations of the n. and w. of Europe used iron weapons during what must have been their B. age. And they repudiate the proposed appropriation of different modes of burial to the different ages—a point on which the supporters of the theory appear to be hopelessly divided among themselves—on the ground that graves assigned to the B. period have been found to contain more iron than B., and that other supposed characteristics of sepulchers of the B. age are quite as common in sepulchers of the iron age. But although the threefold classification of the Scandinavian and German archaeologists cannot be relied upon for historical uses, it may be accepted as a very convenient mode of arranging archæological objects. It has been adopted, with some modifications, in the gallery of British antiquities in the British museum at London, in the national museum of the antiquaries of Scotland at Edinburgh, in the museum of the royal Irish academy at Dublin, and in other collections. For implements of bronze age, see illus., ARCHÆOLOGY, vol. I., figs. 7, 8, 13, 18, 19, 37.

BRONZE-WING, BRONZE-WINGED PIGEON, and BRONZE PIGEON, names given in the Australian colonies to certain species of pigeon (see PIGEON and COLUMBIDÆ), chiefly of the genus *peristera* of Swainson, on account of the lustrous bronze color with which their wings are variously marked. They are otherwise also birds of beautiful plumage.—The COMMON B. or bronze-winged ground dove (*columba* or *peristera chalcoptera*) is distributed over all the Australian colonies. It is often seen in flocks, feeds on the ground, and builds its nest chiefly on low branches of trees growing on meadow-lands or near water. It is a plump bird, often weighing fully a pound, and is acceptable at every table.—The BRUSH B. or little bronze pigeon (*C.* or *P. elegans*) is not so plentiful nor so widely distributed, chiefly inhabiting Tasmania and the southern parts of Australia. It inhabits low swampy grounds, never perches on trees, resembles a partridge in its habits, and makes a loud burring noise like a partridge when it takes wing on being alarmed.—The HARLEQUIN B. (*C.* or *P. histrionica*) is found in the n.w. parts of New South Wales in great flocks, feeding on seeds.—Some of the species of *geophaps*, another of the genera or sub-genera of the *columbidæ*, are also sometimes called bronze-wing. Their partridge-like appearance and habits have gained for them the name of partridge pigeon (q. v.).

BRONZING is the process of covering plaster or clay figures, and articles in ivory, metal, and wood, so as to communicate to them the appearance of ordinary bronze. Several of the materials employed are of little value, whilst others are expensive. Thus, *gold powder* is used for the finer work, and is prepared by grinding gold-leaf with honey on a stone slab till a very fine state of division is attained, then washing out the honey, and drying the gold powder. Inferior gold-leaf, or that which contains much silver and copper, yields the *German gold powder* employed in bronzing. *Copper powder* is prepared by introducing an iron bar or plate into a solution of copper, when the latter metal is precipitated as a finely-divided red powder. *Mosaic gold*, or *musivum*, is made by fusing 1 lb. of tin, introducing $\frac{1}{2}$ lb. mercury, allowing the alloy or amalgam to cool, then pulverizing and grinding up with $\frac{1}{2}$ lb. sal-ammoniac, and 7 ozs. sublimed sulphur. Ultimately, the whole is subjected to the process of sublimation, when the tin, as a brilliant yellow powder, resembling gold, is left in the subliming vessel. The color of mosaic gold may be deepened by the addition of red oxide of lead, and it then assumes a copper tint. *Gold size* is prepared by heating 1 lb. of linseed oil, and gradually adding 4 ozs. of gum animi in very fine powder. When boiled sufficiently, it assumes the consistence of tar, and may then be strained through cloth. When employed in bronzing, some vermilion is added, to make it opaque, and turpentine,

* M. Frederic Troyon, of Lausanne, one of the Swiss antiquaries who accept the three periods of their Scandinavian brethren, instances certain stone axes (now in the collection of baron Renberg, at Prague), which were found, along with their cores, at the site of a primitive manufactory of these weapons in Bohemia. "These cores," he says, "when replaced in the holes from which they had been taken (easily verified by the corresponding veins of the stone), left so little play-room, that it was evident they could only have been detached by a metal point, and not by a hollow cylinder, which could not have given to the hole its conical form, now quite apparent. Instead of the soft iron which is employed nowadays in such operations, the ancients used copper or bronze; and, of course, water and silicious sand were likewise employed in the process."

to make it thin and limpid enough to be easily laid on the plaster cast or other article with a brush, and the object may ultimately be rubbed over with soft chamois leather, which is occasionally dipped into the gold size. The other B. powders are best laid on with a solution of gum-arabic or isinglass, either of which acts as a cement.

Gun-barrels are bronzed by acting upon them with the chloride or butter of antimony (bronzing salt), or with hydrochloric or nitric acids, when the surface of the iron gets partially eaten into, and covered with a thin film of oxide; after which the gun-barrel is thoroughly cleaned, oiled, and burnished. A brownish shade is thus communicated to the barrel, which protects it from rust, and at the same time renders it less conspicuous to an enemy or to game. In the bronzing operation known as the Damascus, the barrel is treated with dilute nitric acid and vinegar, to which sulphate of copper has been added. The result is, that metallic copper is deposited irregularly over the iron surface; and when the latter is washed, oiled, and well rubbed with a hard brush, a very pretty appearance is communicated to the barrel. Articles in wood that require to be bronzed, are first coated with a mixture of size and lampblack, and dried, and then a bronze powder, consisting of very finely-divided patent yellow, raw umber, pipe-clay, lampblack, and Prussian blue, is put on with a brush. After being dried again, the article is burnished with cloth or leather, covered with a layer of Castile soap, and, lastly, cleaned up with a woollen cloth. Copper vessels, coins, etc., are bronzed by heating them in a copper boiler containing vinegar, with 2 parts of verdigris, 1 of sal-ammoniac dissolved in it, when, after sufficient boiling, a pleasant reddish-brown hue is imparted. Bronze and copper articles may have an antique appearance communicated by applying a solution of sal-ammoniac 1 part, cream of tartar 3, common salt 6, hot water 12, and more or less nitrate of copper, when an ancient greenish hue is obtained.

BROOCH (from a root signifying to pierce; comp. Eng. *to broach*; Fr. *brocher*, to spit, or to stitch; Wel. *broc*, to stab), an ornamental pin or instrument for fastening the dress, consisting for the most part either of a ring or disk or of a semicircle, there being a pin in either case passing across it, fastened at one end with a joint, and at the other with a hook. Brooches were much used in antiquity, and varied in form as much as in modern times. They were worn both by men and women, and with a view both to ornament and use, from the time of Homer to the fall of the western empire. Nay, in the early portion of the middle ages, and even amongst semi-barbarous tribes, the art of making *fibule* seems not only to have flourished, but to have attained marvelous perfection. Many of those found, both in Ireland and in Scotland, are wonderfully beautiful in workmanship, and still more so in design.

BROOKE, a co. in West Virginia, in the "Panhandle"—a narrow strip between Ohio and Pennsylvania; 84 sq.m.; pop. '90, 6660. Surface hilly, soil fertile; productions agricultural, coal, and natural gas. The Pittsburg, Cincinnati, Chicago, and St. Louis railroad passes through it. Co. seat, Wellsburg.

BROOKE, FRANCIS J., 1768-1851; a Virginian, an officer in the revolutionary army, speaker of the Virginia senate, and presiding judge of the court of appeals.

BROOKE, HENRY, dramatist and novelist, was b. about 1703, at Rantavan co., Cavan, Ireland. His father was a wealthy clergyman. In 1720 he entered Trinity College, Dublin, and in 1724 he went to study law in London, and became the chosen friend of Pope and Lyttleton. He was recalled to Ireland by a dying aunt who left him guardian of her daughter, a child of twelve, whom he afterwards married, and with whom, five or six years later, he returned to London. Here he published (1735) *Universal Beauty*, a poem, and in 1739 a play, *Gustavus Vasa*, full of the noblest sentiments, which was, however, prohibited at Drury Lane and was afterwards produced in Dublin as the *Patriot*. In 1740 Brooke was taken ill and returned to Ireland, where he published several books and a tragedy, *The Earl of Westmoreland*, which was performed at Dublin, but sank into a state of mental debility and died at Dublin, Oct. 10, 1783. The sonorous eloquence of his plays has not saved them from oblivion; and his novel, entitled *The Fool of Quality*, is the only work of his which is likely to meet the eyes of modern readers. It was originally published in five volumes, and was greatly admired by John Wesley. A new edition was published in 1859, with a preface by the Rev. C. Kingsley.

BROOKE, Sir JAMES, rajah of Sarawak, and governor of Labuan—a man strongly imbued with the spirit of the old adventurers of the Elizabethan time—was b. at Coombe Grove, near Bath, 29th April, 1803. He early entered the East India army, was seriously wounded in the Burmese war, and returning home on furlough, spent some time in travel on the continent. Shipwrecked on the voyage out to join his regiment, he was unable to reach India before his furlough had expired; his appointments consequently lapsed, and he quitted the service. He now conceived the idea of putting down piracy in the Eastern archipelago, and of carrying civilization to the savages inhabiting these islands. He purchased a yacht, which he manned with about 20 sailors, and after a three years' cruise in the Mediterranean, to test the sea-worthiness of his vessel and the seamanship of his crew, sailed from London for Sarawak, a province on the n.w. coast of Borneo, Oct., 1838. When he arrived there, Muda Hassim, the uncle of the sultan of Borneo, was engaged in a war with some rebel tribes. B. lent his assistance, and in return had the title of rajah and governor of Sarawak conferred upon him, the native

governor being forced to resign. B. immediately set about reforming the government, instituted free trade, and framed a new code of laws. The murderous custom of head-hunting, prevalent among the Dyaks, he declared to be a crime punishable with death, and vigorously set about the extirpation of piracy. This was done so draconically as to occasion great dissatisfaction in this country; and the result was, that parliament abolished the "head-money" that had been previously paid for the slaughter of pirates. Certain charges, however, brought against B. in the house of commons, in connection with this matter, were declared by a royal commission to be unsubstantiated. The head-money was received, not by B. and his associates, but by the British ships-of-war that had co-operated with him. On his return to England, B. received a warm welcome, was created a knight commander of the Bath in the year following; and the island of Labuan, near Sarawak, having been purchased by the British government, he was appointed governor and commander-in-chief, with a salary of £2000 a year. In 1857, B., who had been superseded in the governorship of Labuan, but who still acted as rajah of Sarawak for the sultan of Borneo, was attacked at night in his house by a large body of Chinese, who were irritated at his efforts to prevent opium-smuggling, and only escaped with his life by swimming across the creek. The Chinese committed great havoc on his property, but their triumph was short-lived. B. collected some natives, attacked the Chinese, defeated them in several successive fights, and ultimately forced them into the jungle, where they must have perished of starvation. Upwards of 2000 Chinese were killed, and all their flourishing settlements destroyed. Returning to England soon after this, B. lectured in several of the chief towns on the advantages likely to result to that country from a possession of Sarawak, and urged the desirableness of the British government taking it under its protection, as otherwise it was likely to fall into the hands of the Dutch. To enforce this view, an influential deputation waited upon the earl of Derby in Nov., 1858, without success. B. returned to Borneo in 1861, but visited England again twice before his death, June 11, 1868. See SARAWAK.

BROOKE, STOPFORD AUGUSTUS, b. Ireland, 1832; graduated at Trinity coll., 1856; took orders in the Anglican church, and after holding various curacies in London and its vicinity was made chaplain in ordinary to the Queen, 1872. He seceded from the Anglican communion, 1880, affirming his disbelief in the accepted doctrine of miracles. His best known works are *Life of Frederick W. Robertson*, 1865; *Theology in the English Poets*, 1874; *A Primer of English Literature*, 1875; *Sermons*, 6 vols., 1868-88; *History of Early English Literature*, 1892; *The Golden Book of Coleridge*, 1895; *The Old Testament and Modern Life*, 1896, etc.

BROOK FARM ASSOCIATION OF EDUCATION AND AGRICULTURE, a socialistic community, founded, 1841, at West Roxbury, Mass., which adopted the views of Fourier in a modified form and attempted to carry them out in action. The organizer and guiding force of the association was George Ripley. He gathered around him many persons who were then, or afterwards became, famous in literature. Chief among these were Hawthorne, Alcott, George W. Curtis, W. H. Channing, and Margaret Fuller. The aim of this assoc., as explained by Ripley, was "more effectually to promote the great purposes of human culture, to establish the external relations of life on a basis of wisdom and purity," and, especially, "to substitute a system of brotherly co-operation for one of selfish competition." It was open to all sects and welcomed all kinds of degrees and mental culture. All members, without distinction of sex, had to labor an allotted period each day for the common good, either on the farm or in the workshops attached to the main institutions. In pursuance of the attempt toward a more just recompense for labor, all employments were paid substantially alike. All shared the same food at the same table, all owned a like portion of the property belonging to the establishment, all had equal access to its educational and literary advantages. The society trafficked with the outside world, selling its surplus produce, and educating children at a low rate of compensation. But it was soon found that enough could not be earned for the needs of the establishment. Moreover many of its brightest ornaments grew weary and left it. The remainder were disheartened. On March 3, 1846, a fire destroyed one of the most important and costly buildings. The association never recovered from this blow. It lingered on for a while and finally dissolved, Oct., 1847. Much of the celebrity attached to this organization is due to Hawthorne's *Blithedale Romance*, in which under the guise of fiction he has evidently utilized many of his experiences at Brook Farm.

BROOKINGS, a co. in e. S. Dakota, on the border of Minnesota and Big Sioux river, 795 sq.m.; pop. 1890, 10,132, of whom 145 were Indians. There are several large streams and many lakes in the territory. Co. seat, Brookings.

BROOKITE, a mineral of pure native titanic anhydride. It is found in Perthshire, Scotland. A kind found in the Ozark mountains is known as *arkansite*.

BROOKLIME, *Veronica Beccabunga*, a species of speedwell (q.v.). It is common in ditches, brooks, and wet places in Europe and in the United States, where it is sometimes called American brooklime. It is a perennial plant, with mostly pedicled, ovate, or oblong leaves, and bluish flowers in axillary racemes.

BROOKLINE, a town in Norfolk co., Mass., on the Charles River and the Boston and Albany railroad, 3 miles w. of Boston, with which it is connected by electric railroad. It is a place of residence for persons doing business in Boston, was incorporated in 1705, and a part of it was annexed to Boston in 1870. There are three villages, banks, high school, a public library, and some notably beautiful churches. Pop. '90, 12,103.

BROOKLYN, former city and co. seat of Kings co., N. Y.; after Jan. 1, 1898, constituting the borough of Brooklyn in the Greater New York; situated on the western extremity of Long Island, and is separated from New York by the East river, which connects New York bay with Long Island sound; lat. (at the Navy Yard), 40° 51' 30" n.; long. 73° 59' 30" w.; 147 miles south of Albany; 226 miles northeast of Washington.

HISTORY.—Long Island was originally occupied by thirteen tribes of the Algonquin nation; the site of Brooklyn belonging to the Canarsie tribe. From them Jacques Bontyn and Willem Adriaense Bennett bought in 1636 a tract of 930 acres at Gowanus, extending from 27th Street to New Utrecht. In 1637 Joris Jansen de Rapelje, a Wallloon, bought 335 acres on Wallabout Bay, called by the settlers the "Waal-bogt." The Indian name for this region was *Meryckawick*, and their name for what is now Brooklyn Heights was *Ihpetonga*, the highlands. In 1636 Jan Evertsen Bout settled on the "maize lands of Meryckawick," and with others established Breuckelen, named for a town in Holland, about eighteen miles from Amsterdam. In 1638 the West India Company bought the land east and southeast of Wallabout Bay, where the hamlet of Boswijck sprang up. In 1642 a ferry was established from a point near the present Fulton Ferry to Peck Slip, and a hamlet called "the Ferry" sprang up about it. In 1646 Breuckelen was organized, and the "Five Towns"—Breuckelen, Wallabout, the Ferry, Gowanus and Bedford, inland—were united, and received a patent from Governor Nicolls in 1667. In 1651 Midwout, later Flatbush, was founded, and the first church was built there. In 1666 the first Dutch church was built in Breuckelen. After the province passed into the hands of the English, Long Island and Staten Island were called ridings of Yorkshire; Kings County, Staten Island and Newtown constituting the West Riding, and this designation was used until 1683. In 1698 the population amounted to 509 persons, including 65 slaves. On August 27th, 1776, the battle of Long Island was fought on the site of Brooklyn, and the village was held by the British till November, 1783. During the Revolution the British prison ships were moored in Wallabout Bay, and many patriots perished; on the "Jersey" alone it is estimated that eleven thousand died of fever or starvation. In 1799 the first newspaper in Brooklyn was started, the *Courier and New York and Long Island Advertiser*. Brooklyn was incorporated as a village in 1816, and received its charter as a city April 8th, 1834. Slavery was abolished in 1825. Williamsburg, which became a city in 1851, and Bushwick (including Greenpoint) were consolidated with Brooklyn in 1855. A new charter was granted in 1873, and amended in 1880 and 1881. In 1886 the town of New Lots was annexed; in May, 1894, the towns of Flatbush and Gravesend were annexed, and New Utrecht, on July 1st, 1894. Flatlands was taken in on January 1st, 1896, when Brooklyn comprised all of Kings co., and was the largest city in extent in the state, with an area of 65.75 sq. m. Under the act of the legislature of 1897 creating the city of Greater New York, all of the city of Brooklyn as then existing was designated as the borough of Brooklyn. For details of the consolidation, see NEW YORK.

TOPOGRAPHY.—Brooklyn extends north and south about fifteen miles and east and west about twelve miles. Its elevation above tide-water varies from 7 feet to 194 feet at Mt. Prospect. Its water front on the East River and Bay of New York extends from Newtown Creek to the point beyond Sheepshead Bay. The southern and eastern borders are crossed by a broad range of low hills extending into Queens County. Along the shore opposite the lower point of New York is an irregular bluff, rising to an elevation of 70 to 100 feet, known as Brooklyn Heights. A large part of the southern portion of the city is low. The Eastern District, formerly Williamsburg, includes the thickly settled portions north of Wallabout Bay, and contains a large number of manufactories, and the entire water front is devoted to commerce. Greenpoint, lying between Bushwick and Newtown Creeks, occupies the extreme northwestern part of the city, and contains large shipyards and manufactories.

BUILDINGS.—Fulton Street, the principal business street of Brooklyn, begins at Fulton Ferry and runs first south and then east a distance of six miles. A short distance from the ferry are the entrance to the Brooklyn Bridge (See BRIDGE), the new terminals for the elevated roads, and the plaza formed from the land acquired by the city for the purpose. The next object of interest is the City Hall, a white marble Ionic building, with a portico of six columns, approached by a long flight of steps. East of the City Hall is the Kings County Court House, a handsome marble structure in Corinthian style; and adjoining are the Municipal Buildings and the Hall of Records, a handsome edifice of white oolitic limestone, in Renaissance style, containing immense vaults for storing public documents. On the small triangular green in front of the City Hall stands a fine bronze statue of Henry Ward Beecher, by J. Q. A. Ward. At the corner of Washington and Johnson Streets, a little north of City Hall Square, is the new Post Office, a fine granite building 165 feet square, erected at a cost of \$1,886,115. It is built in Romanesque style, with numerous turrets and a tall tower, but is disadvantageously situated on a narrow street. It was opened in 1892, and is occupied by the Post Office and the Federal Courts. On the opposite corner is the new and attractive building of the Brooklyn *Eagle*, a leading newspaper of the city. Most of the financial institutions of Brooklyn centre about City Hall Square, from which Montague Street runs to the river, a distance of about four blocks, and ends in a terrace which commands a fine view of New York and the harbor. The most noteworthy buildings on this street are the Academy of Music, the Art Asso-

ciation Building, and the Brooklyn Library. The Academy is the largest place of amusement in the city, with a seating capacity of 2300. Adjoining it is the Art Association Building, of pure Gothic form, in brown stone ornamented with colored marble. In its galleries are held the exhibitions of the Art Association and of the Brooklyn Art Club. Opposite is the fine Venetian Gothic building of the Brooklyn Library, which contains a circulating library of more than 100,000 volumes, a large and valuable reference library and reading rooms. On the next corner is the beautiful Gothic church of the Holy Trinity, the leading Episcopal church in the city. It has a spire 275 feet high, remarkable for its tracery and finials. On Remsen Street is the Congregational Church of the Pilgrims, of which Dr. Storrs is pastor, and which contains a piece of the original Plymouth Rock in its walls. On the corner of Clinton Street is the handsome house of the Hamilton Club, in front of which stands the excellent bronze statue of Alexander Hamilton, designed by W. C. Partridge. On the corner of Pierrepont and Clinton Streets is the building of the Long Island Historical Society, a handsome structure of red brick with terra-cotta ornaments. It contains a lecture hall, a reference library of about 60,000 volumes, and a museum of Long Island relics. Diagonally opposite is the elaborate and costly building of the Brooklyn Bank, of white granite in classic style with red tiled roof. This region is known as the Heights, and is one of the most attractive districts of the city, and contains the principal hotels, large apartment-houses, and several of the leading clubs. Columbia Heights, a street running parallel with the river, is on the highest part of the bluff. Opposite each cross street pretty little parks have been laid out, and afford glimpses of the river and New York. At the north end of the Heights, on Orange Street, stands the famous Plymouth Church, where Henry Ward Beecher preached for forty years. It is a plain brick building, seating about 2800 persons, and contains one of the largest church organs in America. Near the City Hall, on Joralemon Street, is the well-known Packer Institute for girls. In the next street is the Polytechnic Institute for boys, for which a fine new Romanesque addition has been constructed. On Schermerhorn Street is the Germania Club-house, a Romanesque building with an elaborate and graceful façade. The handsome Romanesque Thomas Jefferson Club-house stands opposite the Hall of Records. From the City Hall to the junction of Flatbush Avenue Fulton Street is the chief retail shopping district. In this region, between Smith and Hoyt Streets, stood the first Dutch church, and here was the nucleus of the village of Brooklyn. On the corner of Bond Street is the building of the Young Men's Christian Association, one of the finest in the country. It contains a hall capable of seating 1400 persons, and a remarkably fine gymnasium. On Flatbush Avenue, a short distance above its junction with Fulton, is the Long Island Railroad Station. Near it is the attractive Young Women's Christian Association Building of buff brick, finished in 1892. A few blocks farther east is the fashionable district known as the Hill. The most beautiful streets are Clinton and Washington Avenues, which are wide and well shaded, and contain many beautiful residences. Between De Kalb and Myrtle Avenues is Washington Park, on the site of the Revolutionary earthworks known as Fort Putnam, and later as Fort Greene. It contains about 30 acres, and lies on a high ridge, on the crest of which is the site of the old redoubt. From this point the ground slopes in three beautiful grassy terraces, broken by flights of stone steps. On the second terrace is the vault containing the remains of the American soldiers who perished on the prison-ship Jersey. Some distance to the northeast is the Navy Yard, the principal naval station in the United States. It lies on Wallabout Bay, and covers about 144 acres, the yard proper including 45 acres, and has more than a mile of wharfage. Among the most interesting features are the great granite dry-docks; one 307 feet long by 98 feet wide, and costing \$2,000,000; while the newer dock is 465 feet long and 210 feet wide. On Ryerson Street, situated near De Kalb Avenue, is Pratt Institute, one of the best-equipped technical institutions in the world, founded by the late Charles Pratt in 1884, and endowed by him with funds amounting to more than \$3,690,000. The buildings are the Main Building, the High School, the Science and Technology Building and the Trade School; and include classes for instruction in all trades and useful arts. There are about 125 teachers and nearly 4000 students. The free public library of the Institute contains over 60,000 volumes. Brooklyn's chief attraction is Prospect Park, in the southwestern part of the city. It is situated on a high ridge, and commands fine views of New York, the harbor, Long Island and the ocean. It has an area of 500 acres, and though not as elaborately laid out as Central Park, has many natural beauties, in its fine old trees, wooded hills, and broad meadows. The principal features of the park are the lake, containing 61 acres, and Lookout Hill, which is 185 feet above the sea, and gives a magnificent view. Near the entrance is a fine statue of J. S. T. Stranahan, by MacMonnies. At the southern entrance is an imposing gateway, near which begins the Ocean Parkway, a magnificent drive leading to Coney Island $5\frac{1}{4}$ miles distant. It is 210 feet wide and has three separate roadways bordered by trees. Much of the fighting in the battle of Long Island took place within the limits of the Park, and is commemorated by a tablet in Battle Pass. The principal entrance is at Flatbush Avenue, and the circular Plaza in front of it is adorned by a large fountain, a bronze statue of Lincoln, and the imposing Memorial Arch, erected in honor of the soldiers and sailors of the Civil War. The Eastern Parkway, a boulevard 200 feet wide, runs from the Plaza in an easterly direction. On it, near the Plaza, is being erected the new Museum of Arts and Sciences of the Brooklyn Institute. The building, which will be in classic style, will be 480 feet square, built around four interior courts, and will cost about \$3,000,000.

EDUCATION.—There were, in 1896, 115 public schools, 2859 teachers, and 127,571 registered pupils, with an appropriation of \$2,986,261, of which \$2,000,000 was for teachers' salaries. The public school system includes a training-school for teachers, a Girls' and a Boys' High School, a Manual Training High School, and a truant school. Brooklyn is celebrated for its excellent private schools. Four are of the first rank—Packer Institute for girls, with 763 students; the Polytechnic Institute for boys, with 781 students; the Adelphi Academy for boys and girls, with 965 students; and Pratt Institute, with nearly 4000 students. There are two Roman Catholic colleges, three business colleges, the Medical School of the Long Island College Hospital, with which is connected the Hoagland Laboratory, with apparatus probably unsurpassed in the United States, the Brooklyn College of Pharmacy, and 14 free kindergartens. The principal educational organization is the Brooklyn Institute, developed from an association founded in 1823, and chartered 1843; enlarged and re-chartered 1887-1890. Its aim is the advancement of art, science and education of the people by means of lectures, classes and collections. It includes twenty-five departments, each of which holds meetings and lectures, and has a membership of 2000. The Brooklyn Art School is now affiliated with the Brooklyn Institute. Good art schools are also connected with the Adelphi Academy and with Pratt Institute.

LIBRARIES, PRESS.—The largest library is the Brooklyn, a subscription library containing 120,000 volumes. The library of the Long Island Historical Society contains 54,000 volumes. The principal free libraries are those of Pratt Institute, 60,000 volumes, the Brooklyn Institute, 15,600 volumes, the Union for Christian Work, 31,768 volumes, the Spicer Memorial, 7,500 volumes, the Y. M. C. A., 14,000 volumes, and the Y. W. C. A., 7,000 volumes. There are 5 daily and a large number of weekly and monthly periodicals.

CHURCHES AND INSTITUTIONS.—Brooklyn was long known as the City of Churches, but that title is no longer appropriate. There are now 307 Protestant and 61 Roman Catholic churches. There are 20 hospitals; the most important being Brooklyn, Long Island College, Brooklyn Homœopathic, Methodist, General, St. Mary's, St. Peter's and St. John's. Brooklyn has 5 training schools for nurses, 24 dispensaries, 11 homes for the aged, 25 orphan asylums and industrial schools, 6 nurseries, and homes for incurables and consumptives. The public institutions at Flatbush consist of the Almshouse, Hospital, and Insane Asylum. The Inebriates' Home is at Bay Ridge.

THEATRES AND CLUBS.—The leading Brooklyn clubs are the Hamilton, Montauk, Oxford, Union League, Lincoln, Jefferson, Brooklyn, Germania, Crescent Athletic—all owning handsome houses—the Riding and Driving Club, and the Midwood Club of Flatbush. The oldest theatre is the Park; the Columbia is the finest, and has a seating capacity of 2000. Among the other theatres are the Star, the Bijou, and Amphion.

PARKS AND CEMETERIES.—Besides Prospect and Washington Parks, there are 19 parks in the city, and 9 others are being laid out. Within or near Brooklyn there are thirty cemeteries, with an aggregate area of 3100 acres. The largest are Greenwood, Evergreens, Cypress Hills, Calvary and Holy Cross. Greenwood, the most beautiful burial-place in the country, is situated on a high ridge in the southern part of Brooklyn, overlooking the bay, and contains about 474 acres. At the principal entrance is an elaborate gateway, ornamented with bas-reliefs. Greenwood was opened in 1842, and since then more than 270,000 interments have been made.

MILITIA.—The National Guard of Brooklyn comprises the Thirtieth, Fourteenth, Twenty-third and Forty-seventh Regiments, the Third Battery of Artillery, a Signal Corps, the Seventeenth Separate Company, and Troop C, about 3100 men in all. The Twenty-third is the leading regiment, and has a fine armory.

FINANCE AND TRADE.—In 1896 Brooklyn contained five national banks, with capital of \$1,352,000; nineteen State banks, with capital of \$3,000,000; fifteen savings banks, with \$115,564,925 deposits; eight trust companies, 33 co-operative savings and building loan associations, and five fire insurance companies. Brooklyn is one of the largest grain and warehouse depots in the United States. Four-fifths of the grain received by the Trunk Lines and the Erie Canal are stored in the grain elevators of Brooklyn, the capacity of which exceeds 2,000,000 bushels, and the transfer capacity is 125,000 bushels per hour. The warehouses have a capacity of 90,000,000 cubic feet, and the value of articles in storage ranges from \$200,000,000 to \$450,000,000 yearly. The number of manufactories in 1890 was 10,583, with \$161,730,500 capital, employing 109,292 persons, and the value of the products was \$269,244,147. The leading industries are sugar, coffee, chemicals, meat-packing and cordage. Nearly 50 per cent. of the sugar consumed in the United States is refined in Brooklyn. The largest sugar refinery, the largest oil refinery and the largest cooperage works in the world are in Brooklyn. Brooklyn has more than twenty-six miles of wharfrage, and is famous for her docks. The Atlantic Basin lies opposite Governor's Island, and encloses an area of 40 acres, with a wharfrage of 3 miles, bordered by warehouses and elevators; 500 large vessels can be accommodated at one time. The Erie Basin encloses 60 acres and the Brooklyn Basin 40 acres. South of these are the largest dry-docks in the United States. The largest is 600 feet long and 124 feet wide, and can hold the largest vessel afloat. There are 33 lines of steamers that sail from Brooklyn, besides a large number of tramp steamers. The Brooklyn terminus of the Long Island Railroad is at the Flatbush Avenue Station. In addition there are many local railroads to the adjacent resorts.

GOVERNMENT.—The city government (1897) consisted of a mayor and board of 28

aldermen, called the Common Council. There were 15 departments, and the mayor appointed all officials except the Comptroller and the Auditor. See NEW YORK: THE GREATER NEW YORK. In 1896 the tax levy was \$15,969,579; the net city debt, \$56,048,097; assessed valuations, \$582,847,633; tax rate, \$2.90 per \$100. The receipts of the city treasury, with balance from 1895, aggregated \$30,767,016; expenditures, \$27,498,483. The police force numbers 1,745 men, and includes 29 precincts, 3 mounted squads, and has 19 patrol wagons and a patrol boat. The fire department numbers about 850 men, and has 54 engines, a water tower, 2 fire boats, 64 hose wagons and tenders, 15 hook and ladder trucks, and 129 chemical extinguishers. The water supply is drawn from streams and lakes draining an area of 75 square miles, about 20 miles distant. The water is conveyed through a stone aqueduct underground to the city. The present daily supply is 80,000,000 gallons, and will be increased to 105,000,000 gallons. There are five lines of elevated roads, and more than forty lines of electric surface cars, and one cable line. There are fourteen ferries to New York, and the Annex boats connect with Jersey City and Hoboken.

The population in 1790 was 1603; 1800, 2378; 1820, 7175; 1840, 36,233; 1850, 96,850; 1860 (after consolidation), 266,661; 1870, 396,099; 1880, 566,663; 1890, 806,343.

BROOKS, a co. in s. Georgia, bordering Florida; 529 sq. m.; pop. '90, 13,979. Co. seat, Quitman.

BROOKS, CHARLES WILLIAM SHIRLEY, b. Oxfordshire, England, in 1816; was admitted to the bar, but adopted literature as a profession, settling in London. He contributed to leading periodicals and journals, among them *Punch*; wrote several dramas, and the novels *The Gordian Knot*, *The Silver Cord*, etc. He acquired a reputation as a lecturer. On the death of Mr. Mark Lemon, in 1870, B. became the editor of *Punch*. He died in 1874. A volume of his *Wit and Humor* appeared in 1875.

BROOKS, JAMES, 1810-73; b. Maine; a journalist and politician. He graduated at Waterville college, and was principal of a Latin school in Portland; became a writer of letters to various newspapers, and originated the idea of regular correspondence from Washington. As a member of the Maine legislature in 1835, he proposed a survey for a railroad from Portland to Quebec or Montreal. In that year he made a tour of Europe on foot, sending his observations to the *Portland Advertiser*. In 1836, he established the *New York Express*, published both morning and evening, which still survives as a prominent evening newspaper. In 1847, he was a member of the state legislature, and in 1848 was elected to congress. During the native-American excitement, 1841-44, his paper was strongly in favor of that party. In 1850, he favored the compromise measures of Henry Clay, and after the outbreak of the civil war he left the party with which he had been so long identified, and was immediately returned to congress by the democrats. In 1871, after a rapid trip abroad, he published *A Seven Months' Run Up and Down and Around the World*.

BROOKS, JOHN, M.D., 1752-1825; an American patriot who, on hearing of the affair at Lexington, marched to the place from Reading with a company of minute-men just in time to see the British in retreat. He served in the war, and was frequently promoted. After the peace, he resumed the practice of medicine at Medford, and in 1816 was elected governor of Massachusetts, and re-elected annually until 1823.

BROOKS, MARIA GOWEN, 1795-1845; b. Mass.; an American poetess, by Robert Southey called "Maria del Occidente." She lost her father when young, and was protected and educated by her future husband, a Mr. Brooks, a merchant of Boston. After his death, she went to Cuba, and in 1830 visited London and Paris. Some of her works are *Judith*, *Esther*, and other Poems; *Zophiel*, or the Bride of Seven; *Idomen*, or the Vale of Yumuri; and *Ode to the Departed*.

BROOKS, PHILLIPS, D.D., b. Mass., 1835; graduate of Harvard, and in 1859-1870 rector of Episcopal churches in Philadelphia; in the latter year becoming rector of Trinity Church, Boston. He was celebrated as a pulpit orator, and as a vigorous and independent thinker. His freedom from the ordinary sectarian trammels, his liberal views of doctrine, with his profound convictions as to vital Christian truths, and his deeply spiritual yet intensely practical preaching, gave him great popular power. In 1891 he was elected bishop of Massachusetts. He died Jan. 23, 1893.

BROOKS, PRESTON SMITH, 1819-57; graduate of South Carolina college; was in the state legislature, and served in the war with Mexico. In 1853 he was a member of congress, and was re-chosen in 1854. May 22, 1856, he assaulted Senator Sumner, striking him over the head with a cane while in his chair in the senate chamber, and severely injuring him. The house of representatives did not expel him, though a committee reported in favor of doing so; but he resigned, only to be immediately re-elected by his constituents. He died suddenly before the close of the second month of his term.

BROOM, a name given to a number of species of shrubs of the closely allied genera *cytissus*, *genista*, and *spartium*, of the natural order *leguminosæ*, sub order *papilionaceæ*—all of them having long slender branches, along which are produced axillary flowers. The genera differ in the form of the standard (see *PAPILIONACEÆ*), which is roundish in *spartium*, broadly ovate in *cytissus*, and oblongo-ovate in *genista*, whilst *spartium* has also an acuminate keel, and that of *cytissus* is very obtuse, that of *genista* being oblong and not wholly including the stamens and pistil. The legume is many-seeded in all, the

calyx 2-lipped, and the filaments united in a tube.—Common B., *cytiscus scoparius*, the trivial name being from the Lat. *scopa*, long twigs, or a besom—which has by different botanists being ranked in each of the genera just named, although it possesses the characters above assigned to *cytiscus*, but has recently been made the type of a new genus, under the name of *sarothamnus scoparius* or *communis*—is a well-known native of Britain and of the continent of Europe, growing in dry soils, and ornamenting hedgebanks, hills, and bushy places, in May and June, with its large yellow flowers, which are on short stalks, drooping, solitary, but produced in considerable number along the straight slender branchlets. The whole aspect of the plant is graceful. The lower leaves have three oblong leaflets, the upper ones, or bracts, are simple; the branches are angular and of a very dark green, very tough, and much in use for making besoms. They have also been used for tanning and dyeing; and their fiber has been woven into a coarse strong cloth, and even made into paper. The whole plant is very bitter, with a peculiar nauseous taste and smell when bruised. The young tops and seeds are used in medicine, being powerfully diuretic, and very beneficial in some kinds of dropsy. They are also mildly laxative, and in large doses emetic. They are commonly administered in the form of a decoction. B. inhabits colder climates than furze, reaching to a greater elevation on mountains, and being found beyond the northern limit of furze. It varies in size from a very humble shrub to one of 20 or even 30 ft. in height, and when it reaches this size, the wood is of great value for the finer purposes of cabinet-makers and turners.—Irish B., *cytiscus* or *sarothamnus patens*, not unfrequent as an ornamental plant in British shrubberies, is not at all a native of Ireland, but of Spain and Portugal.—Portugal B., or White B., *cytiscus albus*, a native of the countries bordering on the Mediterranean, is very often planted in Britain as an ornamental shrub, and is much admired for the beauty of its fasciated white flowers, which are produced upon long filiform branches. Its leaves have three leaflets. It sometimes attains a height of 15 or 20 feet.—Spanish B., *spartium junceum*, is a native of the s. of Europe, generally growing in dry soils and rocky situations, and attaining a height of 8 ft. or upwards. Its branches are upright, round, and rush-like, a characteristic of this genus. They are smooth, and bear only a few small simple leaves, which soon drop off. The fiber of the branchlets is much used in some parts of Italy, France, and Spain, for making cloth, ropes, etc. In the s. of France, the plant is cultivated on dry unproductive soils. The branchlets are made into bundles, dried, beaten, steeped, and washed, in order to the separation of the fiber. It possesses medical properties similar to those of the common B.—A white-flowered species, *S. monospermum*, occasionally to be seen in British shrubberies, grows abundantly on the loose sands of the coasts of Spain, and produces a similar fiber. It is mentioned by Barth as growing in great abundance in Africa to the s. of the great desert. Many species somewhat resembling these are occasionally to be seen in Britain among ornamental plants, some of them often in greenhouses. The Canary isles produce some remarkable for the fragrance of their flowers. The name B. is not given to those species of *cytiscus* (q.v.) and *genista* (q.v.) which do not display in a marked degree the character of having long slender twigs.—Butcher's B. (q.v.) is a plant of an entirely different family.

BROOM-CORN, a grass cultivated in North America for the manufacture of brooms and whisk brushes, which are made of the tops of the culms and the branches of the panicle. It is regarded as a mere variety of the same species (*Sorghum saccharatum*) of which the shaloo, or sugar-grass (see SUGAR-CANE and DURRA), is another variety. It has been much longer cultivated in America than the sugar-yielding variety, and is said to have been brought from the East Indies. B.-C. often attains a height of 12-15 ft. The stalks are long and hard, and are often plowed under to serve as manure, although cattle will feed on them before they are touched by frost. Cattle are fond of the leaves as well. The seed has about the same value as oats for feeding. The usual practice in harvesting is to bend the stalks 2½-3 ft. from the ground, cut off the tops 6-8 in. below the panicle and lay them in heaps, to be conveyed to the scraper, which is wrought by horse-power and which removes the seed. For marketing, B.-C. is pressed in bales averaging about 300 lbs. each. Five hundred lbs. to the acre is a fair average yield, and the producers generally realize \$40-\$80 per ton. It is usually dried under cover to preserve its color, which, to bring the best prices, must be as green as possible. Formerly the Mohawk and Conn. river valleys furnished most of the supply in the U. S. Illinois now leads, with an annual production of about 14,000 tons, raised chiefly in the central part of the state. Kansas produces from 6000-10,000 tons; Nebraska, from 4000-6000 tons; Missouri, 1000-2000, and Ohio, about 1000. Some attention is paid to its growth in Tennessee, Iowa, Kentucky, and California. The estimated crop throughout the U. S. for 1889 was about 25,000 tons. Spain and Italy raise an inferior quality, but out of the U. S. the production is small. In the manufacture of brooms and whisks the most improved machinery is employed. The exports to Gt. Britain, the Continent, Australia, and the West Indies are large. Also there is a considerable export of the corn in bales to Australia and the West Indies.

BROOME, a co. in s. New York, on the Pennsylvania border; 685 sq.m.; pop. 1875, 42,149; in 1890, 62,973. It is drained by the Susquehanna, Chenango, Otselic, and other streams, and intersected by the New York and Erie, Albany and Susquehanna, Syracuse

and Binghamton, and Delaware, Lackawanna and Western railroads, and the Chenango canal. Productions agricultural, including an immense quantity of butter. Co. seat, Binghamton.

BROOME, WILLIAM, LL.D., 1689-1745; coadjutor of Pope in translating the *Odyssey*. For writing all the notes and translating eight books of the Greek text, B. received \$2500, a price which he considered too small. Comments on this transaction annoyed the poet so that he abused B. in the *Dunciad* and in the *Bathos*. B. published a *Miscellany of Poems*, and translated some of Anacreon's odes.

BROOMRAPE. See OROBANCHEÆ.

BROOMS. See BRUSHES AND BROOMS.

BROSE, a dish sometimes used in Scotland, made by pouring boiling water, milk, or the liquor in which meat has been boiled, on oatmeal, and mixing the ingredients by stirring till small lumps have been formed. Butter may be added, and sweet milk when the brose is made with water. It is called *kail-brose*, *water-brose*, or *beef-brose*, according to the liquid used. *Athole-brose*, a famous Highland cordial, is a compound of honey and whiskey.

BROSSES, CHARLES DE, a learned French historian, was b. at Dijon, Feb. 17, 1709. His first work was *Lettres sur l'Etat de la Ville d'Herculanæum*, the result of a tour through Italy in 1739. At the suggestion of his friend Buffon the naturalist, he wrote the *Histoire des Navigations aux Terres Australes* (1756), in which he described the supposed great southern continent under the several names of Magellania, Australia, and Polynesia. The last two of these names, now commonly used, were first employed by B. His next work was *Du Culte des Dieux Fétiches*, etc. (1760). It was followed by a *Traité de la Formation Mécanique des Langues* (1765), which, in spite of many errors, contains not a few novel and ingenious observations and conjectures. During the greater part of his life, B. was occupied in endeavoring to supply the *lacunes* in the works of Sallust; and having collected about 700 fragments by this historian, he published, with such interpolations as he deemed necessary, the *Histoire de la République Romaine dans le Cours du Septième Siècle, par Salluste* (1777). B. died as president of the parliament of Burgundy May 7, 1777. His letters from Italy, under the title *Italie il y a Cent Ans*, were edited and republished by his son René, count de Broesses, in 1834.

BROTH is an infusion or decoction of vegetable and animal substances in water. It is customary to use more or less meat, generally ox-flesh, with bone, and certain vegetables, as cabbage, greens, turnips, carrots, pease, beans, onions, etc. The whole are mixed together in cold water, heat slowly applied, and the materials allowed to simmer for some hours. The meat yields up certain ingredients, whilst others are retained in the residual flesh. The following table will illustrate this:

Ox-flesh heated with water

Yields to the Water.	
Albuminous matter.	
Gelatine.	
Kreatine.	
Extractive matters or osmazome.	
Lactic acid.	
Salts.	
Fat.	
Saccharine matter.	

Leaves in the Boiled Meat.
Fibrin.
Coagulated albumen.
Gelatinous tissue.
Fat.
Nervous matter.

The vegetables yield albuminous constituents, coloring and mucilaginous matter, and volatile oils and salts.

The real nutritive material present in B. is less than is generally thought, though it aids in satisfying the cravings of the appetite. To invalids, however, the form of B. known as beef-tea (q.v.) is of great importance, as it affords the weak and sickly stomach a light palatable article of diet at a time when stronger food would do the weakened system much harm. See NUTRITION.

BROTHERHOODS, RELIGIOUS. These were societies instituted for pious and benevolent purposes, and were numerous in the middle ages. Their origin is probably to be traced to the desire which then prevailed to imitate the spiritual orders. They were usually founded at first without ecclesiastical authorization, on account of which, several of the confraternities that either did not seek or did not obtain the recognition of the church, assumed the character of sects, and were suspected of heresy. To this class, among others, belonged the Beghards and Beguines (q.v.), the Brothers and Sisters of the Free Spirit (see below), the Apostolic Brethren (q.v.), the Flagellants (q.v.), who, tolerated by the church for a while, at last incurred its displeasure, and were severely persecuted. We may also reckon among religious B. the old building corporations, from which sprang the order of Freemasons, the religious character of whose secret societies indicated, in the opinion of the church, a peculiarly dangerous gnosis and symbolism. Others coming into existence under ecclesiastical oversight, or at least being confirmed by the church, had no *arcana*, but were simply dedicated to the promotion of religion, either by the imposition of new penances, the acceptance of new and severer devotions, or the assisting of strangers, travelers, the unprotected, the oppressed, the destitute, and

the sick. Nor can we refuse our admiration and approbation to such self-denying fraternities, when we remember how defective were the early communities in charitable institutions. They were most numerous in Italy, Rome alone boasting more than a hundred.

BROTHERS AND SISTERS OF THE FREE SPIRIT, a sect which sprang up in the Rhine country during the 13th c., and afterwards spread into France and Italy. It grounded its peculiarities on the biblical doctrine that the Holy Spirit is a spirit of "freedom." Misunderstanding the true nature of spiritual freedom, the members of this sect conceived themselves released not only from the thralldom of the church, but also from the obligations of morality. They set aside the marriage-tie, and indulged in licentiousness. A few even maintained that the deeds of the body could not possibly affect the soul. Intellectually, they are said to have been given to Pantheism. The synods of Cologne in 1306, and of Treves in 1310, decreed their suppression, and in the persecutions which ensued, they appear to have been completely dispersed.

THE BRETHREN OF SOCIAL LIFE, BRETHREN OF THE COMMON LOT, or BRETHREN OF GOOD WILL (also called **HIERONYMITES** and **GREGORIANS**, from Hieronymus and Gregory the great, whom they claimed as patrons), a fraternity founded about 1376 by Geert Groote (b. at Deventer, 1340, d. 1384) and Florentius Radewin (b. 1350, at Leerdam, in s. Holland, d. 1400). This society—which professed to be a copy of the earliest Christian communities, and was in several respects a forerunner of the subsequently formed societies of United Brethren, now sometimes styled Moravians—was composed of persons who sought after pious and spiritual exercises without any conventional distinctions of order, etc. Community of goods, ascetic habits, industry, care of the education of young persons, and the use of the vernacular language in divine service, were some of the chief points insisted on by the brethren, who were not fettered by monastic or any other vows. Perfect community of goods was a rule of their societies. Despite the persecutions which they suffered from the mendicant friars, they were recognized and sanctioned by several popes and by the council of Constance. They became most numerous in the Netherlands and n. Germany, but also spread themselves in Italy, Sicily, and Portugal, so that, in 1430, they reckoned more than 130 societies. The last was founded at Cambrai in 1505. Several brotherhoods of Gregorians assisted in the reformation. In other cases, their institutions fell into the hands of the Jesuits. Though the original founders of these societies were opposed to all learning and science which was not purely moral and practical, their followers rendered most important services to popular education, having free schools in connection with many of their houses, supporting students at other schools, and distributing useful books. They have, indeed, been not incorrectly described as pioneers of the reformation. After the revival of learning in Italy, the Brethren of Social Life entered into the spiritual activity of the time. The most important and distinguished members of the society were Gerhard Zerbold of Zütphen, Thomas-à-Kempis, and the learned cardinal Nicholas Cusa.—Female societies, of a similar character, sprung up at the same time with those of the Brethren of Social Life. At the head of each was a superior or directress, who was styled the *Martha*.

BROTHER JONATHAN, a synonym for the people of the United States, as "John Bull" is for the people of England. When Washington took command of the revolutionary forces in New England, he found an immediate necessity for arms and other war materials. Jonathan Trumbull was then governor of Connecticut, a man of excellent judgment, and a highly esteemed friend of Washington. It happened that at an important council of officers where the wants of the service were the topic under consideration, Washington remarked, in reference to some knotty question: "We must consult Brother Jonathan," meaning Governor Trumbull. The expression was repeated on occasions of difficulty, and before the war closed it was established as a convenient name for the whole people. See **TRUMBULL, JONATHAN**.

BROTHERS, a name given to a group of six or eight rocky islets immediately outside the strait of Bab-el-Mandeb, varying in height from 250 to 350 feet. They lie off the African coast about 9 m. s. of the island Perim, now occupied by England. Of the loftiest point, the lat. and long. respectively are 12° 28' n., and 43° 22' e.—Brothers is also the name given to three isolated mountains near the coast of New South Wales, between Harrington inlet to the s., and Port Macquarie to the n., or between lat. 32° and 34½° south. They are valuable as landmarks.

BROTHERS, LAW OF DESCENT AMONG. In the law of England, this was immediate, without reference to the parent as the *commune vinculum*; but by the 3 and 4 Will. IV. c. 106, s. 5, it is enacted that no brother or sister shall be considered to inherit immediately from his or her brother or sister, but every such descent shall be traced through the parent. See **INHERITANCE**.

BROTHERS, LAY, an inferior class of monks, not in holy orders, but bound by monastic rules, and employed as servants in monasteries (q.v.).

BROTHERS, RICHARD, b. Newfoundland 1757; a fanatic, whose prophecies and writings excited a sensation, was at one time a lieut. in the British navy, which he quitted in 1789. Refusing, from conscientious scruples, to take the requisite oath to enable him to receive his half-pay, he was reduced to great distress, and ultimately placed in the

workhouse. Dating his first call from 1790, he announced himself, in 1793, the apostle of a new religion, "the nephew of the Almighty, and prince of the Hebrews, appointed to lead them to the land of Canaan." In 1794, he published a book, in two parts, entitled *A Revealed Knowledge of the Prophecies and Times*, etc.; and, in 1795, an *Exposition of the Trinity*. He was the author of several other publications, marked by a strange mixture of reason and insanity. In consequence of prophesying the death of the king, and the destruction of the monarchy, he was committed to Newgate, but soon liberated. Some of his political predictions, especially in reference to the state of the continent, were either altogether or partially fulfilled; and many persons were induced to sell their goods, and prepare to accompany him to his New Jerusalem, which was to be built on both sides of the river Jordan, where he was to arrive in the year 1795. His disciples were not confined to the poor and ignorant, but even men of ability and education were deluded into believing in him, two of the most eminent being Nathaniel Brassey Halhed, esq., M.P., the orientalist, and Sharp, the celebrated engraver. As a dangerous lunatic, he was at length, by order of government, committed to Bedlam, but released April 14, 1806, and died Jan. 25, 1824.

BROTHERS AND SISTERS OF CHARITY. Under these names, there exist in the Roman Catholic church two widely ramified beneficent societies, for the nursing of the poor and sick in hospitals, without distinction of faith, rank, or nation. The order of the brothers of charity, or Compassionate Brothers, was established in 1540, at Seville, in Spain, by the Portuguese John di Dio (died 1550), who had served in Africa under Charles V. The funds for the purpose were obtained by begging. The primitive object of the society was the care of the sick, and the reformation of women of immoral character: it was composed of lay-members, under no rule. In the year 1572, the order received the papal recognition, and was subjected to the rule of St. Augustine. All the privileges of the mendicant orders were conceded to it in the year 1624, and it was then divided into a Spanish congregation, with a maj.gen. in Granada, and an Italian or extra-Spanish congregation, with a maj.gen. in Rome. To the latter belong also the brothers of charity in Switzerland, Germany (where Austria is their chief seat), Poland, the Netherlands, France, and other countries. The European members of the order clothe themselves in black; the extra-European, who are under a separate gen. of their order in America, wear brown. Their services to distressed humanity continue to be held in high estimation. The sisters of charity, formerly also, on account of their dress, called *gray sisters*—independent associations of unmarried Christian females, for the alleviation of human suffering, especially for the tending of the sick and the poor—were first called into existence in France, in 1634, by Vincent de Paul (born 1576), greatly assisted by the noble-hearted and self-devoted widow, Le Gras, by birth De Marillac. The society was recognized in 1655 by Clement IX., and in 1685 already numbered 224 convents. The French revolution sorely interrupted the abundant and benevolent labors of the sisters of charity by the suppression and proscription of their convents in France; but Napoleon restored the order in 1807 by the convocation of a general chapter of the scattered sisters, under the presidency of the empress mother, and by the grant of the necessary funds; and there exist at present more than 300 associations in France, where, in the villages, elementary education is in great part conducted by them. They attend the sick in all the great hospitals. There exists in Germany a Roman Catholic association of unmarried females, not bound by conventual rules, and possessing the right of withdrawing from the association at pleasure, but placed under a strict supervision, and occupied in the same duties as the sisters of charity. The institute of deaconesses (q.v.) in the Protestant churches of the continent of Europe is of a very similar character. See **SISTERHOODS**.

BROUGHAM, HENRY, LORD BROUGHAM AND VAUX, was b. in Edinburgh, 19th Sept., 1778. His father, Mr. Henry Brougham, was the descendant of an ancient family in Westmoreland, and his mother, Eleonora Syme, who was a woman of much talent, was a niece of Robertson the historian. B. received his education at the high school, and afterwards at the university, of Edinburgh. He gave early promise of future ability, some mathematical papers written by him at the age of eighteen having been considered worthy of publication in the transactions of the royal society. He spent some time in traveling on the continent, and in 1800 was admitted to the Scotch bar. In company with Jeffrey, Horner, and Sydney Smith, B.'s first public efforts were given to the service of the *Edinburgh Review*, and he contributed to it some of its most powerful articles. His liberal political views excluded him from the hope of promotion in Scotland, and a character which he had acquired for eccentricity and indiscretion, excluded him from all legal practice, except the unremunerative practice of the criminal courts. After seven years of vain attendance in the courts at Edinburgh, he betook himself to a field more worthy of his ambition, and in 1808 passed at the English bar.

In London, B. first attracted public notice by the admirable appearance he made at the bar of the house of commons, when he was employed on behalf of certain Liverpool merchants to ask the repeal of the orders in council. Soon after this, in 1810, he entered parliament, and within a few months of the time of taking his seat, brought in and carried his first public measure—an act making participation in the slave-trade felony. He was welcomed by the opposition leaders, to whose party he had attached himself, as a

most powerful assistant in their attacks upon the government. B. succeeded in carrying the repeal of the obnoxious orders in council shortly before the general election of 1812, and then ventured to contest, along with another whig, the membership for Liverpool against Canning and another tory. He was defeated, and remained without a seat in parliament till 1816, when he was returned for Winchelsea, and again became an active member of the opposition. By this time he had also established some reputation in the courts of law. He never, indeed, acquired a very large practice, but he repeatedly distinguished himself by speeches of great vigor and ability in the defense of persons prosecuted for libel by the crown. His most famous appearance as an advocate, however, was in defense of queen Caroline, when, along with Denman, he defended the injured queen with unequalled courage and disinterestedness, at the cost, as both well knew, of exclusion, for years to come, from all professional advancement. But his eloquence and boldness, though they forfeited for him the favor of the crown, gained him that of the people, and for the ten years between 1820 and 1830, B. was the popular idol. He made no bad use of his power. In 1822, he used it, though in vain, in support of a scheme of national education; and to his activity is owing, in great measure, the establishment of the London university, of the first mechanics' institute, and of the society for the diffusion of useful knowledge. In 1830, B. delivered a most powerful speech against slavery, and in consequence of it—as he himself believed—was invited to stand, and returned, as member for the great popular constituency of the co. of York. The aristocratically disposed whigs would—had they dared—have excluded B. from the reform ministry; but, in addition to having enormous popularity, he was virtually their leader in debate in the commons, and was thus, in spite of his unmanageableness, indispensable. After various intrigues, B. was offered, and was persuaded, against both his interests and his inclinations, to accept a peerage and the chancellorship. He took his seat in the lords in Nov., 1830, and assisted very materially in carrying through that house the great measures then proposed by the liberal ministers. He shared in the general unpopularity which afterwards attached to them, and when they were dismissed by William IV. in 1834, B. left office, never to return to it. After that time, he held in the upper house a position as nearly analogous as may be to that formerly held by him in the commons, criticising freely the conduct of successive administrations, and steadily forwarding every measure for social progress.

It will be as a law-reformer that B. will be best remembered. He took up Romilly's uncompleted task of carrying into practice the ameliorations suggested by Bentham. His efforts in this direction began as early as 1816, when he introduced into parliament a bill to remove various defects in the law of libel. In 1827, in a memorable speech which occupied six hours in delivery, B. enumerated the defects in nearly every branch of English law, and made proposals for dealing with law-reform on a proper scale. These, as might have been expected, met with little encouragement. It has been the fortune of many of his measures to be carried afterwards, in a mutilated form, by other hands. After he left office, B. also succeeded in carrying various reforms in the law, among which may be noted some very extensive changes in the law of evidence. Among the measures proposed by B., but left for future law-reformers to carry, were bills for the codification of the criminal law, for the establishment in England of a system of public prosecutors, and for the giving of compensation to parties acquitted. Lord B.'s acts and bills, as well those regarding the slave-trade, education, and other public questions, as those touching on law-reform, have been collected and published by Sir J. E. Eardly Wilmot (Lond., Longman, 1857). The large well-filled volume which they form is the most fitting monument that could be preserved of the activity, perseverance, and public spirit of the man.

As an orator, more especially as a debater in parliament, B. was, among the men of his time, inferior only to Canning. He was wont, however, to indulge in his speeches in too large an admixture of exciting elements: argument was mingled with fiery declamation; ridicule, sarcasm, invective, were freely used; and these he dealt out with a vehemence and energy that at times carried him far beyond bounds. The power of ready, rapid, and forcible diction was eminently his. In many other fields besides oratory, B. has won a high reputation. He cultivated mathematical and physical science with success, and ventured upon the domain of metaphysics, and even of theology. His miscellaneous writings are of great extent, and upon an almost incredible variety of subjects. They were, however, intended more to serve purposes of the moment, than as permanent additions to our literature; and though they display great powers of rapid comprehension and nervous clear exposition, it cannot be said that we are indebted to their author for any new truths in politics or morals, or any original discoveries in science. The honors due to men of letters B. did not fail to acquire, having successively been made lord rector of Glasgow University, president of University College, London, member of the Institute of France, chancellor of the University of Edinburgh, and lastly, D.C.L. of Oxford.

While not engaged in parliament, Lord Brougham resided chiefly at Cannes, in the s. of France, where he died May 7th, 1868. He married, in 1819, Mary Anne Eden, the granddaughter of a baronet in the co. of Durham. The issue of this marriage was two daughters, who both died before reaching womanhood. The patent of the title to the peerage was extended to make it descend to the family of his brother. B. left a memoir of his life and times, which was published in 3 vols. (1871).

BROUGHAM, JOHN, b. Ireland, 1810, d. N. Y. 1880, playwright, studied surgery for a considerable time, but was obliged to leave school on account of adversity, and went to London, where he proposed to enter the East India service; but an old man gave him a guinea, and urged him to seek some fitter employment. Happening to meet an old acquaintance, he got an engagement in the Prince of Wales theater, and there in July, 1830, he acted six parts in *Tom and Jerry*. In 1830, he was a member of the company organized by Madame Vestris. About this time he wrote his first play, a burlesque, prepared for William E. Burton, then acting in London. In 1840, he was a member of the Lyceum, for which theater he wrote a number of plays. He came to the United States in 1842, and appeared in the old Park theater in New York city. Soon after he joined Burton's company in Chambers street; and here also he wrote a number of plays, among which were *Vanity Fair*, *All is Fair in Love*, *Dombey and Son*, and the *Irish Emigrant*. Afterwards he managed Niblo's Garden, and in Dec., 1850, he opened Brougham's Lyceum on Broadway, where he produced *David Copperfield*, and a new version of the *Actress of Padua*, the latter written for Charlotte Cushman. He then connected himself with Wallack's company, in which he remained until 1860; then managed the Bowery theater, reviving *King John* with superb scenery. Meanwhile he was writing plays, among which were the *Game of Love*, *Bleak House*, *A Decided Case*, *Game of Life*, *Playing with Fire*, *Pocahontas*, *Love and Murder*, *Romance and Reality*, etc. After several seasons at Wallack's, he rejoined Burton and produced his burlesque of *Columbus*, and other plays. In 1860, he went to England, where he remained five years, and there too he was writing and adapting plays, among them the *Duke's Motto*, for Mr. Fechter. He reappeared in New York in Oct., 1865, and not long after again joined Wallack's company, with which he remained until the close of his life. Among his later plays are *John Garth*, and *The Lily of France*.

BROUGHTON, JOHN CAM HOBHOUSE, Lord, 1786-1869; an English statesman. At his death the peerage became extinct, as he left no male issue. In his school days at Cambridge he was the intimate friend of Byron, and the two made a tour of southern Europe at a later period. He was a radical, and, in 1816, wrote a book to correct certain current misrepresentations of the events of the *Hundred Days in Paris*. The work gave great offense both in England and France. The translator and printer in Paris were sentenced to fine and imprisonment for an "atrocious libel," and in London he was confined in Newgate nearly three months. As a martyr to torism, he tried for parliament in the borough of Westminster, but was defeated, though chosen by a large majority only two years later. For 12 years he was an ardent and courageous advocate of liberal measures, among them the repeal of the test and corporation acts, and Roman Catholic emancipation. In 1831, he became a baron, and in the same year was secretary of war in the Grey ministry. Subsequently he was chief commissioner of woods and forests, and president of the board of control. In 1851, he became a peer, and ceased to participate in public life. Lord B. published *Imitations and Translations from the Classics; Journey through Albania with Lord Byron*; and *Historical Illustrations of the Fourth Canto of Childe Harold*.

BROUGHTON, RHODA, a popular novelist, the daughter of a clergyman, was born in Wales in 1840, but spent much of her life in Oxford. Among her works, all of which are clever and entertaining, but of inferior literary quality, are: *Cometh up as a Flower* (1867); *Not Wisely but too Well* (1867); *Red as a Rose is She* (1870); *Nancy* (1873); *Joan* (1876); *Belinda* (1883); *Doctor Cupid* (1886); *Alas!* (1890); *Scylla or Charybdis* (1895), etc.

BROUS'SA, or **BOUR'SA**, the ancient *Prusa*, where the kings of Bithynia usually resided, situated in lat. 27° n., long. 40° e., at the foot of Mt. Olympus, in Asia Minor. Prusa is said to have been built by Prusias, king of Bithynia, who waged war with Croesus or Cyrus. Seifeddulat, of the race of Hamadan, took it in 336 of the Hegira, but it was retaken by the Greek emperor in 947 A.D. In 1356, Orkhan, son of Othman, the second emperor of Turkey, captured it, and made it the capital of his empire, and it continued so until the Sultan Amurat II. removed the capital to Adrianople. The Tartars plundered it in 1402. It successfully withstood the attack of the Karamanians in 1413, but in 1512 it was taken by Ala Eddin. Ibrahim Pasha seized it in 1833, and from 1852 to 1855 it afforded a refuge to Abdel Kader. Besides these vicissitudes it has suffered much from fire and earthquakes.

B. is most pleasantly situated, facing a beautiful and luxuriant plain, covered for many miles with plantations of mulberry-trees. The city and suburbs are about 6 m. in circumference. The town is divided from the eastern suburb by a deep channel or vale, over which there are several bridges, one of them—with shops on each side—being 90 paces long and 16 broad. The streets are remarkably clean, and the bazars very good, being supplied with European goods from Constantinople. The population of Broussa is estimated at 75,000. It contains a great number of mosques, some of which are very fine buildings. The silks of B. are much esteemed in the European markets, and great quantities were formerly exported. It is the seat of an Armenian and Greek archbishop. Meerschaum clay is found near by, and there are many hot springs on the spur of the mountain in the vicinity. The waters are mostly alkaline, and are used for bathing. On a rock near the center of the town stands the citadel. Caravans conduct the trade with the interior, but a railway connects the city with the Port of Mudania on

the Sea of Marmora. In 1855 it was nearly destroyed by an earthquake. In a neighboring village are the tombs of Orkhan and Othman. The growth of the city has been very rapid since the Russo-Turkish war, and it is still an important commercial center, although some of the manufactures for which it was formerly famous, for example that of chinaware, have declined.

BROUSSAIS, FRANÇOIS JOSEPH VICTOR, the founder of the physiological system of medicine, was b. at St. Malo, Dec. 17, 1772, and, after studying at Dinon, served for a time in the navy, and then in the army. In 1820, he was appointed first professor at the military hospital of Val-de-Grace. In 1830, he became professor of general pathology and therapeutics in the faculty of medicine in Paris, and afterwards was made a member of the institute. He died at his country residence at Vitry, Nov. 17, 1838. In 1841, a statue was erected to his memory in the court of Val-de-Grace. B.'s peculiar views are ably explained in his chief works—the *Histoire des Phlegmasies ou Inflammations Chroniques* (1808), and *Examen de la Doctrine Médicale généralement adoptée* (1816), which assert the following principles: that life is sustained only by excitation; that this excitation may be either too strong (*surexcitation*) or too weak (*adynamie*), the latter case, however, being far less frequent than the former. These abnormal conditions of surexcitation and adynamie at first manifest themselves in a specific organ of the body; but afterwards, by sympathy, are extended to other organs; that is, all diseases are originally *local*, and become *general* only by sympathy of the several organs. The organs most subject to disease are the stomach and bowels, and therefore *gastro-enteritis* (inflammation of the stomach and the intestines) is the basis of pathology; consequently, B. resorted to local phlebotomy—especially the application of numerous leeches to the region of the abdomen—as a remedy in fevers and various diseases. His theory and practice gained many adherents in France, who took the name of the “physiological school.” But a more exact knowledge of physiology has demonstrated that the views of B. were one-sided and exaggerated. Yet they have not been without use in pathology, as they have led to a more careful study of pathological anatomy and physiological sympathies, and to a more exact observation of the so-called specific morbid processes of which the existence was denied by B. and his followers. Montègre, *Notice Historique sur la Vie, les Travaux, et les Opinions de Broussais*.—His son, CASIMIR B., born 1803, professor at Val-de-Grace (1833), was a zealous adherent of the Broussais system, and is the writer of a work, *Hygiène-Morale*, based on phrenology.

BROUSSON, CLAUDE, 1647–98; a French Protestant, an advocate and legal defender of the Huguenots. His house was the rendezvous of certain leaders of an outbreak, and he was compelled to fly from the city (Toulouse), barely escaping into Switzerland. He ventured into France twice afterwards, at great peril; but in 1698 he was caught, after many escapes, and sentenced to be broken on the wheel on the charge of treasonable conspiracy with the duke of Schomberg to invade France. He was executed accordingly, Nov. 4, 1698. He left a number of works on the subjects of the period.

BROUSSONET, PIERRE MARIE AUGUSTE, 1761–1807; a French naturalist educated in medicine, and a professor at the age of 18. He labored zealously to establish the Linnæan system of botany in France, and visited England, where he was admitted to the royal society, publishing in London *Ichthyologia Decas I.* In Paris he was perpetual secretary of the society of agriculture, and a member of the electoral college of the city. Subsequently he visited Madrid and Lisbon, and went as physician to an embassy which the United States sent to the emperor of Morocco. Still later he was French consul at Teneriffe; in 1797 a member of the institute, and in charge of the botanical garden at Montpellier. He died of apoplexy soon after his election to the national legislative body. France is indebted to him for the introduction of the Merino sheep and the Angora goat.

BROUSSONETIA. See **MULBERRY**.

BROUWER, ADRIAN, about 1606–38; a Dutch painter. He was apprenticed to Franz Hals. He was improvident and dissipated, and his pictures deal chiefly with drinking scenes and tavern life. They show great skill in coloring and cleverness in characterization. The best collection is in the Munich gallery.

BROWN, a co. in Illinois, on the Illinois river; 300 sq. m.; pop. '90, 11,951. In part prairie and in part wooded with fertile and well-cultivated soil. It is intersected by the Toledo, Wabash, and Western railroad. Agriculture is the main business. Co. seat, Mount Sterling.

BROWN, a co. in s. Indiana; 330 sq. m.; pop. '90, 10,308; well wooded, and with tolerably productive soil. Agriculture is the chief occupation. Co. seat, Nashville.

BROWN, a co. in n.e. Kansas on the Nebraska border; 576 sq. m.; pop. '78, 10,446; in '90, 20,319. The co. is crossed by the Missouri Pacific and the St. Joseph and Grand Island railroads. Productions, grain, hay, butter, and cattle. Co. seat, Hiawatha.

BROWN, a co. in s. Minnesota, on the Big and Little Cottonwood; 585 sq. m.; pop. '79, 15,817; Chief business, agriculture. Co. seat, New Ulm.

BROWN, a co. in n. Nebraska; area, 1020 sq. miles; pop. '90, 4359. It is drained by Niobrara river, bounding it on the n., and crossed by the Fremont, Elkhorn and Missouri Valley railroad. Co. seat, Ainsworth.

BROWN, a co. in s.w. Ohio, on the Ohio river; 460 sq. m.; pop. '70, 30,802; in '90, 29,889. Hilly near the river, but level inland; fertile and well cultivated. Produces grain, butter, sorghum molasses, and some wine. Co. seat, Georgetown.

BROWN, a co. in n.e. S. Dakota, formed 1879 and organized 1880; 1720 sq. m.; pop. '90, 6737. It is drained by the James river. Co. seat, Aberdeen.

BROWN, a co. in c. Texas, on Colorado river; 900 sq. m.; pop. '90, 11,359. Hilly and prairie surface, with rich soil. Chief business, stock raising. Co. seat, Brownwood.

BROWN, a co. in e. Wisconsin at the head of Green bay; 530 sq. m.; pop. '90, 39,164. Uneven surface; productions agricultural. The Chicago and Northwestern and several other railroads pass through. Co. seat, Greenbay.

BROWN, BENJAMIN GRATZ, b. Ky., 1826; graduate of Yale; made his home in St. Louis, and in 1852 was a member of the legislature. In 1854, he started the *Missouri Democrat*. In the civil war he fought for the union, commanding a brigade. In 1863 he was a United States senator from Missouri, and in 1872 was the democratic candidate for vice-president. He d. 1885.

BROWN, CHARLES BROCKDEN, a celebrated American novelist, was b. at Philadelphia, Jan. 17, 1771. His early education was carried on under the care of Mr. Robert Proud, author of the *History of Pennsylvania*. Afterwards he studied for the law, but the license which he had already given to his imagination induced an unconquerable aversion to legal pursuits, and he consequently betook himself to literature. The French revolution exercised on him, as on many other ardent spirits, a considerable influence; several of his writings at this period being penetrated with the new thoughts and sentiments which sprung out of that great convulsion. In 1798, he published *Wieland*, the first of his remarkable fictions; and in 1799, *Ormond, or the Secret Witness*. His next production was *Arthur Mervyn, or Memoirs of the Year 1793*—the fatal year of yellow-fever in Philadelphia. In 1801, appeared *Edgar Huntly, or the Adventures of a Sleep-Walker*, "a romance presenting a greater variety of wild and picturesque adventure, with more copious delineations of natural scenery, than is to be found in his other works."—*Prescott*. This was followed in the same year by *Clara Howard*, and in 1804 by *Jane Talbot*, first printed in England. He died of consumption in 1810.

BROWN, FORD MADDOX, b. Calais, France, of English parents, 1821. He studied art on the continent, and in 1844 sent two cartoons to Westminster Hall which won the admiration of Haydon and of Dante Rossetti. A warm friendship resulted between Rossetti and himself, and when the former founded the Pre-Raphaelite Brotherhood, B., though he held himself aloof from actual membership in the society, was generally looked upon as one of its master spirits. Among his best known pictures are "Wicliff reading his Translation of the Scriptures," 1848; "King Lear," 1849; "Chaucer at the Court of Edward III., 1851; "Christ Washing Peter's Feet," 1852; an historical series in the Town Hall, Manchester, 1890; etc. He d. in 1893.

BROWN, FRANCIS, D.D., 1784-1820; a native of New Hampshire, and graduate of Dartmouth college, of which he became president in 1815. Some of his sermons and pamphlets have been published.

BROWN, FRANCIS; D.D., educator; b. in Hanover, N. H., Dec. 26, 1849; graduated at Dartmouth college in 1870, and at the Union theological seminary in 1877; became instructor in Biblical philology at the seminary in 1879 and associate professor in 1881; and was made professor of Hebrew and the cognate languages there in 1890. His publications include *Assyriology, its Use and Abuse in Old Testament Study*.

BROWN, SIR GEORGE, a distinguished British gen., b. at Linkwood, near Elgin, Scotland, in Aug., 1790; entered the army in 1806, became lieut. in 1807, and was present in the latter year at the capture of Copenhagen. He served in the peninsular war. At the battle of Talavera he was severely wounded, and at the storming of Badajoz was one of the forlorn-hope. He was appointed maj., May 26, and Lieut.col., Sept. 29, 1814, in which year he embarked in Maj.gen. Ross's expedition against the United States of America, and was wounded at the battle of Bladensburg. From Feb. 6, 1824, to 1842, he commanded a battalion of the rifle brigade. He was made adj.gen. of the forces, April, 1850, and lieut.gen., 1851. In the Crimean war, 1854-55, B. commanded the light division. At the battle of Inkerman, Nov. 5, 1854, he was severely wounded, and obliged to retire for a short time to Malta. In 1855, he was created a knight commander of the Bath. In the expedition to the Sea of Azof, he commanded the British troops; and in the first unsuccessful attack on the Redan of Sebastopol, he had the chief command of the storming-party. He was gazetted, April 3, 1856, "gen. in the army for distinguished service in the field." He was a knight of Hanover, received the Turkish order of the Medjidie of first class in 1855; and the grand cross of the legion of honor, 1856. In 1860, he became commander-in-chief in Ireland, and in 1862 a privy-councilor. He died in 1865.

BROWN, GEORGE, naval officer; b. in Indiana, June 19, 1835; became a midshipman in the U. S. navy 1849, commander 1866, captain 1877, commodore 1887, and rear-admiral 1893; and was commandant of the naval station and yard at Norfolk, Va., in 1893-7. He retired in 1897.

BROWN, GEORGE LORING, b. 1814 in Boston; an American painter, of whose productions the more notable are "The Crown of New England" (the White Mountains), and "The Harbor of New York." He d. 1889.

BROWN, GOOLD, 1791-1857; a grammarian; b. in Rhode Island; for 20 years a teacher in New York, and author of several elementary and progressive works on English grammar, the most important of which is his *Grammar of English Grammars*.

BROWN, HENRY ARMITT, 1844-78; b. Philadelphia; graduated at Yale coll.; was admitted to the bar, but distinguished himself chiefly as a political orator. He earnestly advocated the cause of municipal reform in Philadelphia, made numerous speeches throughout the country in favor of Rutherford B. Hayes during the presidential campaign of 1876, and delivered brilliant addresses on anniversary and festival occasions, etc. A posthumous collection of his speeches, with a memoir, appeared in 1880.

BROWN, HENRY BILLINGS, associate justice of the U. S. Supreme Court, was born at Lee, Mass., in 1836. He was graduated from Yale college in 1856, and then traveled in Europe for a year. Upon his return he studied law at the Yale and Harvard law schools, and, upon graduating, removed to Detroit, Mich., where he was admitted to the bar in 1860. For several years he was assistant United States district attorney in that district of the Federal court, and in 1868 he was, by appointment, for several months judge of the Circuit Court of Wayne county. In 1876 he was appointed by President Hayes United States district judge for the eastern district of Michigan. In 1875 he compiled a volume of admiralty reports, and in Dec., 1890, was appointed by President Harrison to the vacancy on the supreme court bench caused by the death of Justice Samuel Miller.

BROWN, HENRY KIRKE, b. Mass., 1814; an American sculptor, well known for works in bronze. He studied portrait-painting in Boston, and after spending some years in Italy, settled in Brooklyn, N. Y. He made the first bronze cast achieved in the United States. Some of his figures are "Hope," "The Pleiades," "The Four Seasons," and statues of De Witt Clinton, Washington, Nathaniel Greene, Lincoln, and Gen. Scott. He d. 1886.

BROWN, JACOB, 1775-1828; an American general commanding on the Canadian frontier in the war of 1812; he showed skill and courage in the defense of Sackett's Harbor, and in the battles of Chippewa and Niagara Falls. In 1821 he was chief in command of the United States army.

BROWN, J. APPLETON, b. Mass., 1844; landscape painter; resident of New York. He studied mainly under Lambinet, of Paris. Among his works are "Old Road near Paris," and "On the Merrimack near Newburyport."

BROWN, JAMES BALDWIN, D.D., 1820-84; b. England; for many years pastor of the Independent church at Brixton, London; was elected chairman of the Congregational Union of England and Wales, 1878. He was widely known and honored as a preacher, scholar, and author. His books have found many admiring readers in the U. S.

BROWN, JOHN, of Haddington, once the most popular, and still among the most revered, theological writers in Scotland, was b. in 1722, at Carpow, near Abernethy, in Perthshire. Deprived of both his parents when only 11 years of age, he became assistant to a venerable and pious shepherd, named John Ogilvie, who tended his flock among the neighboring hills, and nursed the religious ardor of the boy's heart. B., however, aspired to be wise as well as good. His thirst for learning was insatiable, and the most romantic yet well-accredited stories illustrative of this are related by his biographers. While still a friendless herdsman he had made great progress in a self-acquired knowledge of Greek and Latin. The extent of his acquisitions, even at this early time, may be estimated from the fact, that the country people round about believed he was in league with the devil, and that he had pledged his soul for unhallowed lore. At a later period of his life, "he knew nine or ten languages, classical, oriental, and modern, and had amassed vast stores of Puritan, Scottish, and Dutch divinity." After a brief career as a peddler—an employment which English readers will understand from Wordsworth's *Excursion* was neither mean nor degrading—B. became a volunteer in a regiment of militia raised in Fifehire during the rebellion of 1745, and in 1747, schoolmaster in the neighborhood of Kinross. During the vacations of his school, he studied philosophy and divinity under the inspection of the Associate Synod, and the superintendence of the Rev. Ebenezer Erskine and James Fisher. In 1750, he was ordained pastor of the Secession church at Haddington. Perhaps a more faithful, industrious, and holy minister never labored in Scotland. David Hume was once prevailed upon to go and hear him, and the criticism of the great skeptic was: "That old man preaches as if Christ were at his elbow." Although self-educated, he had little of the narrowness which culture so obtained generally brings along with it; he corresponded on friendly terms with Episcopalians, and often expressed a warm affection for all true Christians. Although himself a sound Presbyterian, and a tolerably strict Calvinist, "the love of the Lord" was his real and ultimate test of a man's orthodoxy. In 1758, B. first appeared as an author. His work was entitled *A Help for the Ignorant*, etc. In 1765, he published his famous *Christian Journal*, in which the common events of life are richly but quaintly, and perhaps somewhat artificially, spiritualized. In 1768, he was appointed professor of divinity under the Associate Synod, and in the same year issued his valuable *Dictionary of the Holy Bible*. In 1771, appeared his *History of the Church from the Birth of the Saviour*—a work good enough for cottage-reading, but possessing no merit otherwise; and in 1778, *The Self-interpreting Bible*. This last is B.'s *magnum opus*, and has been amazingly popu-

lar in Scotland; even high dignitaries of the English church have praised and recommended it. Besides these works, B. published a great variety of sermons, tracts, etc., which had an extensive popularity. He died on 19th June, 1787.

BROWN, JOHN, M.D., founder of the Brunonian system of medicine, the son of a day-laborer, and himself first intended for a weaver, b. in 1736, in Bunkle parish, Berwickshire, was educated at the grammar-school of Dunse, in which he was subsequently an usher. After studying medicine at the Edinburgh university, he became tutor to the children of the celebrated Dr. Cullen, and assistant in his university lectures. Conceiving himself slighted by Cullen, he commenced giving lectures himself upon a new system of medicine, according to which all diseases are divided into the sthenic, or those depending on an excess of excitement, and the asthenic, those resulting from a deficiency of it; the former to be removed by debilitating medicines, as opium, and the latter by stimulants, such as wine and brandy. His system gave rise to much opposition, but his partisans were numerous; for a time his opinions had some influence. In 1779, B. took the degree of M.D. at the university of St. Andrews, and in 1780 published his *Elementa Medicinæ*. He was also author of *Observations on the Old System of Physic*. In 1786, being overwhelmed with debt, he removed to London, where he died of apoplexy in 1788. His works, with a memoir by his son, Dr. William Cullen Brown, appeared in 1804 (3 vols. 8vo).

BROWN, JOHN, 1736-1803; merchant of Providence, R. I.; the leader of the men who destroyed the *Gaspee*, an English sloop of war, June 17, 1772. He was arrested and put in irons, but escaped. He was a member of congress from Rhode Island, and a patron of Brown university.

BROWN, JOHN, 1744-80; graduate of Yale, and king's attorney in New York. In 1775 he was an emissary in Canada to provoke the people against the English government. He was with Allen at the capture of Ticonderoga, and at Quebec when Wolfe was killed. He was killed by Indians while on the way to help Schuyler in the Mohawk valley campaign.

BROWN, JOHN, 1757-1837; b. Va; soldier in the revolutionary army. He was a student at Princeton and at William and Mary college; and after residing in Kentucky for a few years, returned to Virginia, and represented that state in congress, 1787-93. From 1793 to 1805, he was United States senator from Virginia.

BROWN, JOHN, D.D., grandson of John Brown, of Haddington, was b. 12th July, 1784, near Whitburn, Linlithgowshire. He studied at Edinburgh university, and afterwards at the theological hall of the secession church in Selkirk. In 1806, he was ordained to the pastorate of a church in Biggar, a small town in Lanarkshire, where he labored for 15 years, employing his leisure hours in those studies which subsequently enabled him to take a high rank as a biblical expositor. In 1822, he was transferred to Rose street church, Edinburgh, and in 1829 to Broughton place church in the same city. In 1834, he was appointed professor of pastoral and exegetical theology in connection with the associate synod. He died 13th Oct., 1858. As a preacher, Dr. B. was among the first of his time. For clearness of scriptural exposition, chaste and powerful language, and majestic ardor and earnestness of manner, he had no equal in his denomination, and no superior in Scotland. The attractiveness of his delivery was heightened by a countenance singularly noble, tender, and sweet. Among his works are *The Law of Christ respecting Civil Obedience*; *The Resurrection of Life*; and his important and scholarly *Expository Discourses on the Epistles of Peter, on the Epistle to the Galatians, and on the Epistle to the Romans*. See Dr. Cairns's Memoir (1860).

BROWN, JOHN, M.D., physician and author, son of the preceding, b. in 1810; studied in the university of Edinburgh, and practiced medicine in that city. His practice was successful, but not large, and his fame rests mainly on his literary works, which consist of three volumes of sketches termed *Hore Subsecivæ* ("leisure hours") in 1858-61, and *John Leech and Other Papers* in 1882. The style of these writings is humorous and pathetic, and they deal chiefly with homely subjects. The little sketches termed *Rab and his Friends* show his best qualities and have obtained great popularity for their quaintness, delicacy and clear and pleasing style. His literary motto was that an author should not publish anything "unless he has something to say and has done his best to say it aright," and for this reason he published but little, distrusting his own powers and subjecting what he wrote to the severest criticism. He died in 1882 after an uneventful and somewhat melancholy life. See *Recollections of Dr. John Brown* by A. Peddie in 1893.

BROWN, JOHN, was born in Conn., May 9, 1800; d. Dec. 2, 1859; an abolitionist, celebrated as the originator of the insurrection at Harper's Ferry. He was intended for the ministry, but was compelled to give up study on account of inflammation in his eyes. With his family he removed to Ohio, where he worked as a tanner, and engaged in the wool trade, in which he failed. He then went to Essex co., N. Y., and began as a farmer, but in 1854 followed his four sons, who had settled in Kansas, and were subjected to much persecution on account of their opposition to slavery. When the free-state men organized to repel the Missourians who were besieging Lawrence, Brown and his sons were among the foremost on the free-state side; and a little later they made a remarkable defense against vastly superior numbers near Ossawatimie. After many rough adventures in the Kansas troubles, B. formed the project of an insurrection in the south among the slaves as the surest means of securing their liberation. He drilled

a small force in Iowa in the winter of 1857, and the next spring, in Canada, drew up a new provisional constitution for the states, under which he was selected as commander-in-chief, one of his sons, and Richard Realf and John Kagi, being civil officers. The next important event was the rescue by B. of certain slaves in Missouri who had been sold and were to be taken to Texas, one of the owners of the property being slain in the conflict. Again he went to Canada, returning to the United States in the summer. His attempt to capture the arsenal at Harper's ferry was made on Sunday night, Oct. 16th, 1859. The arsenal was easily seized, several citizens were taken into custody, conspicuous houses were searched for arms, and few of the citizens knew what was going on until mid-forenoon, when they began to rally; some scattered firing followed, one colored man was killed (by Brown's men), the mayor was slightly hurt, and so was one of Brown's sons. There was no sign of a rising of negroes, and before noon Brown and his men were in the arsenal, virtually prisoners. A feeling of rage prevailed so strongly, that a man who came from the arsenal with a flag of truce was instantly killed, and one prisoner was put to death. At night Brown had three unwounded whites and a few useless negroes for his army; one of his sons lay dead, and another was badly wounded. In the morning a force of United States marines arrived, and Brown, fighting desperately to the last, was taken prisoner, being wounded once with a sword, and twice with the bayonet. All of the invaders were indicted for conspiring to incite insurrection, and for murder and treason. After a trial of three days, in which Brown was unable, on account of his wounds, to stand up; he was found guilty, and sentenced to death on the scaffold within 48 hours. He died calmly on the 2d of Dec., 1859.

BROWN, JOHN GEORGE, genre painter; b. Durham, England, 1831; educated in the Royal Scottish Academy and the National Academy of Design in New York; lived in New York after 1853; became an academician in 1863; and subsequently president of the American water-color society. He delights in portraying city and country life, with child figures.

BROWN, JOHN YOUNG, b. Ky., 1835; graduated at Centre coll., Danville, Ky., 1855; admitted to the bar, 1857. He was elected to the XXXVth congress, but not having attained the age required by the constitution of the U. S., was not allowed to take his seat until the second session. He was elected to the XLth, XLIIIrd, and XLIVth congresses; and governor of Kentucky, 1891.

BROWN, JOSEPH EMERSON, b. S. Car., 1821; graduated at Yale law school; began practice, 1846; elected to the state senate, 1849; elected gov. of Ga. by the democrats, 1857; re-elected, 1859; and again elected, 1861, over two opposing candidates. He was active as a war governor during the rebellion, opposing pres. Davis on the conscript act. After the war B. became a prominent reconstructionist, voting for Gen. Grant, against the wishes of the majority of his party. He suffered the only political defeat of his life in 1868, when, as the republican candidate for U. S. senator, he was beaten by Joshua Hill, dem. He was appointed chief justice of the Supreme court of Ga., became a reconstructionist democrat, was elected to the U. S. senate, 1879, 1884, and gave \$50,000 each to the university of Georgia and the Southern Baptist Theological Seminary, He d. in 1894.

BROWN, NICHOLAS, 1769-1841; b. R. I.; the chief patron of Brown university, which in 1804 changed its name in his honor from Rhode Island college.

BROWN, or BROWNE, ROBERT, 1549-1632; an English clergyman, founder of the sect of Brownists, was born at Toilethorpe, Devonshire; was educated at Benet (Corpus Christi) college, Cambridge, and after serving as domestic chaplain to the duke of Norfolk, taught school in Southwark and gave private religious instruction, then returned to Cambridge, where he was offered a pulpit, but refused to be licensed by a bishop, and soon was inhibited from preaching at all. In 1579 he formed at Norwich a Separatist church, and after being imprisoned for his opinions, emigrated, 1580, with his flock to Middleburg, Zeeland, where he published (1582-83) several controversial books, including *A Treatise of Reformation without Tarrying for Anie*, and *A Booke which Sheweth the Life and Manners of all true Christians*. Dissensions arising in his congregation, he repaired to Scotland, 1583, where he assailed the order and discipline of the Presbyterian church, then returning to England, was excommunicated (about 1586), which led him to become "reconciled" to the English church. He was elected master of St. Olave's grammar school, Southwark, and in 1591 was made rector of a church near Oundle, Northamptonshire. Some writers represent him as ever hot-headed and quarrelsome (he was imprisoned on various charges thirty-two times); others, as an ambitious fanatic. Dexter, *Congregationalism of the Last Three Hundred Years*, defends the sincerity of his aims in early life, and avers that "he anticipated, by two generations, Roger Williams as an advocate of the doctrine of toleration and of liberty of conscience." Brown and his followers objected to certain doctrines of the established church, as well as to its government, nor would they commune with other reformed churches, because they tolerated "unregenerate" persons as members. They held marriage to be a civil contract, refused the baptism of the children of those not church members, rejected forms of prayer, and would have every church independent, and place all power in the hands of the laity. See BROWNISTS and INDEPENDENTS.

BROWN, ROBERT, an eminent botanist, the son of an Episcopal clergyman, was b. at Montrose, Scotland, Dec. 21, 1773, and educated at Marischal college, Aberdeen. Having studied medicine at the university of Edinburgh, he became, in 1795, ensign and assistant-surgeon in a Scottish fencible regiment, with which he went to Ireland. Devoting himself to the study of botany, he resigned his commissions in 1800, and the following year was, on the recommendation of sir Joseph Banks, engaged as naturalist in the expedition sent out under Capt. Flinders for the survey of the Australian coasts. On his return, in 1805, he brought home nearly 4000 species of Australian plants, a large proportion of which were new to science. Soon after, he was appointed librarian to the Linnean society. To the *Transactions* of the Edinburgh Wernerian society and those of the Linnean society, he contributed memoirs on *Asclepiades* and *Proteaceæ*, and published *Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen's*, vol. i. 1810; a supplement to this work appeared in 1830, relating to the *Proteaceæ* only. He also wrote the *General Remarks, Geographical and Systematical, on the Botany of Terra Australis*, attached to the narrative of Capt. Flinders' expedition, 1814. His adoption of the natural system of Jussieu, the French botanist, led to its general substitution in place of the Linnean method. B.'s numerous memoirs in transactions of societies, and other contributions to botanical science, secured for universal approval the title conferred on him by Alexander von Humboldt of *Botanicorum facile Princeps*. In 1810, B. received the charge of the library and splendid collections of sir Joseph Banks, which, in 1827, were transferred to the British museum, when he was appointed keeper of the botanical department in that establishment. In 1811, he was elected F.R.S.; in 1832, D.C.L. of Oxford; and in 1833 was elected one of the 18 foreign associates of the academy of sciences of the institute of France. In 1839, the royal society awarded him their Copley medal for his *Discoveries during a Series of Years on the Subject of Vegetable Impregnation*. He was president of the Linnean society from 1849 to 1853. He died in London, June 10, 1858. A collected edition of B.'s works, in 5 vols. 8vo, has been published in Germany.

BROWN, Sir SAMUEL, 1776-1852; b. in London, England; engineer. He served with distinction in the navy through the French war; became a retired captain in 1842; and is best known for his method of making iron chain cables, and as the designer and builder of the first iron suspension bridge in England, across the Tweed at Berwick, opened in 1820. He also designed the suspension pier at Brighton.

BROWN, SAMUEL GILMAN, D.D., LL.D., b. Maine, 1813; graduated at Dartmouth college and Andover theological seminary; traveled in Europe; was professor in Dartmouth of oratory and intellectual philosophy; elected president of Hamilton college in 1867, and resigned the position in 1880. Dr. B. published a *Life of Rufus Choate*; *Biography of Self-Taught Men*; etc. He d. 1885.

BROWN, SAMUEL R., D.D., 1810-80; b. Conn. His mother was the author of the familiar hymn, *I love to steal a while away*. The family removed in early childhood to Monson, Mass. Dr. B., as an American missionary, founded the first Protestant Christian school in China, at which Yung Wing, former member of the embassy from China to the United States, and chief of the educational commission which had 120 Chinese youths in New England schools and colleges, was educated. Graduated from Yale in 1832, Dr. Brown sailed for China, 1838, and was manager of the Morrison Chinese school for boys, at Canton, 1838-47. He was in the United States, 1847-59; and in 1859, was stationed at Yokohama, Japan, as one of the first missionaries. He was translator of the Bible into Japanese, and of several Japanese books; author of *Colloquial Japanese*, a grammar; *Prendergast's Mastery System*, adapted to the study of English or Japanese; and of many articles on Chinese and Japanese subjects. He returned to the United States in feeble health, in 1879, and died in Monson, Mass.

BROWN, THOMAS, a Scottish metaphysician, son of the Rev. Samuel Brown, was b. in 1778, at the manse of Kirkmabreck, Kirkcudbrightshire. After being some time at school in England, he went to Edinburgh in 1792, and for several years attended the lectures of Playfair, Black, Robison, and Dugald Stewart. He began the study of law, but shortly abandoned it for medicine; and having taken his diploma of M.D., in 1803, he became (1806) the partner of Dr. Gregory in his large practice. But his strong bent was for literature and philosophical speculation. At the age of 18, he had published a refutation of Darwin's *Zoonomia*; was a member of an academy of physics, or society for "the investigation of the laws of nature," formed in 1797, and embracing the names of Erskine, Brougham, Leyden, Jeffrey, Smith, and others; and contributed at the outset to the *Edinburgh Review*. In 1804, appeared his essay on *Cause and Effect*, in which he holds that there is nothing in a cause but the fact of immediate and invariable antecedence to the change called its effect. Dugald Stewart, professor of moral philosophy in the university, being obliged, from bad health, to retire in 1810, got Dr. B. appointed assistant and successor, which office he continued to discharge till his death, in 1820. He was popular as a professor; and his *Lectures*, published after his death, have gone through a great many editions, though of late they have somewhat fallen out of notice. He also wrote a good deal of poetry, which is now forgotten. Dr. B. attempted to overturn the psychological system of his predecessors, Reid and Stewart, and to substitute

a new and simplified scheme of mental phenomena. The greater part of this new philosophy was the production of his first session as professor, the writing of each lecture being begun on the evening previous to its delivery. A philosophic system thus improvised could not but be crude and inconsistent, however acute and imaginative its author might be. B.'s chief contribution to psychology is the establishment of a sixth or *muscular sense*.

BROWN, THOMAS ALEXANDER (pen name, Rolf Boldrewood), b. in England, in 1826; went to Australia in 1830; was active in the early public life of Melbourne and Sydney; and after 1865 was a police magistrate and gold fields commissioner. His best known works are *Ups and Downs*; *The Miner's Right*; *Robbery under Arms*; *The Squatter's Dream*; *A Sydney-Side Saxon*; *An Australian Squire*; *A Colonial Reformer*; *A Modern Buccaneer* (1894), *Old Melbourne Memories* (1896), etc.

BROWN, ULYSSES MAXIMILIAN, 1705-57; after studying at Limerick, Rome, and Prague, he entered the Austrian army, serving with distinction in Corsica and Italy, and rising rapidly in rank. In 1739 he was field-marshal lieutenant, and one of the aulic council. He was field-marshal in the seven years' war, repulsed the Prussians at Lowositz, and was mortally wounded in the great battle of Prague.

BROWN, SIR WILLIAM, founder of the free public library at Liverpool, b. at Ballymena, Ireland, 1784; was educated at Catterick, near Richmond, Yorkshire; and in his 16th year accompanied his parents to the United States. Employed in the counting-house of his father, who was engaged in the linen trade in Baltimore, in a few years he was admitted a partner. Returning to England in 1809, he established a branch of the business at Liverpool, and laid the foundation of one of the largest mercantile firms in the world. Embarking in the American trade, he became an extensive importer of cotton, and by his rare energy, quick business habits, and sterling integrity, soon became distinguished for the magnitude of his dealings. A liberal reformer, he took a prominent part in local and public affairs, and unceasingly promoted the education of the people. In 1844, he contested s. Lancashire upon the anti-corn-law league interest without success, but was returned to parliament for that division of the country in 1846, and was subsequently three times re-elected. A series of letters in defense of free-trade, which, in 1850, he contributed to the *Pennsylvanian* (Boston newspaper), attracted much attention. He was also an able advocate for the adoption of a decimal coinage. In 1857, he munificently subscribed £30,000 for the establishment of a free public library at Liverpool, and the noble building erected for the purpose owes its existence entirely to his generosity. He died in 1864.

BROWN, WILLIAM LAWRENCE, 1755-1830; minister of the English church at Utrecht, and successor of his father and uncle. He was also professor of moral philosophy and ecclesiastical history in the university, to which was added a professorship of the law of nature. After the French revolution he escaped to England, and at a later period became principal of Marischal college, Aberdeen. In 1800, he was chaplain to the king, and in 1804 dean of the chapel royal. His best known works are *Essay on the Natural Equality of Man*; *On the Existence of the Supreme Creator*; and on the existing religions with regard to their moral tendency.

BROWN COAL, a mineral substance of vegetable origin, like common coal, but differing from it in its more distinctly fibrous or woody formation, which is sometimes so perfect that the original structure of the wood can be discerned by the microscope, whilst its external form is also not unfrequently preserved. In this state, it is often called *wood coal*; and it sometimes occurs so little mineralized, that it may be used for the purposes of wood, as at Vitry, on the banks of the Seine, where the wood-work of a house has been made of it. From this to the most perfectly mineralized state, it occurs in all different stages. It is often brown or brownish-black, more rarely gray. It burns without swelling or running, with a weaker flame than coal; emits in burning a smell like that of peat, and leaves an ash more resembling that of wood than of coal. Wherever it occurs in sufficient abundance, it is used for fuel, although very inferior to common coal. *Bovey coal*, so called from Bovey Tracey, in Devonshire, where extensive beds of it occur, and where it has long been wrought, is B. C., and often exhibits the woody structure very beautifully. B. C. occurs in a number of other places in Britain, and more abundantly near Paris, and in Liguria and Hanover, where it forms thick beds in alluvial deposits.—The *surturbrand* (q.v.) of Iceland is regarded as a variety of it. *Jet* (q.v.) is also sometimes regarded as a variety of brown coal. Although bearing the name coal, B. C. is rather a kind of *lignite* (q.v.) than of coal.

BROWNE, CHARLES FARRAR, an American humorist, better known as "ARTEMUS WARD," was b. in Waterford, Me., in 1834, and after passing through the free village school entered a printing-office. As a printer's boy, he worked in all the principal towns in New England, until settled at Boston, where he began to write comic stories and essays. A roving disposition carried him to the west, and he was engaged as local editor in Toledo, and later in Cleveland, Ohio, where his letters from "Artemus Ward, showman," a pretended exhibitor of wax figures and wild beasts, first attracted general attention. In 1860, he became a contributor to *Vanity Fair*, a New York comic weekly

paper; and, being invited to lecture, soon became very popular and attractive. As a lecturer, in 1863 he visited California, making the overland trip, visiting Salt Lake City, the Mormon capital, and drawing crowds in every town he visited. In 1864, he opened his illustrated lectures on California and Utah in New York, with immense success; and in 1866 was induced to visit England, where he became a contributor to *Punch*, and gave his lecture on the Mormons in the metropolis, at the Egyptian hall, Piccadilly. But while convulsing crowded audiences with laughter, he was wasting with pulmonary disease. Early in 1867, he went to Jersey for a milder air, but with no benefit; and was about to embark for America, when he died at Southampton, Mar. 6, 1867. He was tall, slender, with striking features, and a most amiable character, which attracted and attached to him many friends. By his will, after providing for his mother, leaving legacies to his friends, and his library to the best boy in the school of his native village, he left the bulk of his property in trust to Horace Greeley to provide an asylum for printers. His collected writings, which have had a wide circulation in America and England, are *Artemus Ward His Book*; *Artemus Ward among the Mormons*; *Artemus Ward among the Fenians*; and a posthumous collection and biography entitled *Artemus Ward in England*.

BROWNE, EDWARD HAROLD, D.D., an English bishop, b. 1811; educated at Cambridge, and holding various professorships until in 1864 he was consecrated bishop of Ely; transferred to Winchester, 1873; resigned the office, owing to ill health, in 1890. He published *An Exposition of the Thirty-nine Articles*; *Aids to Faith*, etc. D. 1891.

BROWNE, HABLOT KNIGHT, 1815-82; an English caricaturist and book illustrator, well known under his pseudonym of "Phiz." He first came into prominence in 1835, when he succeeded Seymour as the illustrator of the *Pickwick Papers*; subsequently he illustrated a number of the novels of Dickens, Lever, Mayhew, and Ainsworth, besides contributing to comic serials, etc.

BROWNE, ISAAC HAWKINS, an English poet, 1705-60; educated at Cambridge; then engaging in the law. He was twice chosen to parliament; but his reputation rests exclusively upon his poems, such as *Design and Beauty*, and *The Pipe of Tobacco*, in which he imitates Cibber, Pope, Young, Swift, and others, all of whom were living when it was published. *De Anima Immortalitate*, a close imitation of Lucretius, was his most important work.

BROWNE, JOHN ROSS, b. 1817; an emigrant from Ireland to the United States when a child. He learned shorthand writing, and became a reporter in the United States senate. Having a desire to travel, he went first on a whale-ship, and on his return published a book of observations in Zanzibar. He next went on government business to California in 1849. Two years later he went as correspondent of a newspaper to Europe, traveling through Italy, Sicily, and Palestine, and giving an account in *Yusef*. After further service in the north-western territories and on the Pacific coast, he went to Algeria, Iceland, Poland, and Russia, and published *The Land of Thor*, and *An American Family in Germany*. In 1869, he published an elaborate report on the *Resources of the Pacific Slope*. He was minister to China for a short time, appointed in 1868, but recalled two years later. He died in 1875.

BROWNE, Sir THOMAS, antiquary and physician, was b. in London, 1605. His father, a merchant, left him an ample fortune, and he was educated at Winchester and Oxford. He began the study of medicine, then traveled over France and Italy, and after taking the degree of M.D. at Leyden, returned and settled (1636) at Norwich, where he continued to practice as a physician. He was knighted in 1671 by Charles II., and died 1682. His chief works are: *Religio Medici* (1642); *Inquiries into Vulgar and Common Errors* (1646); and a *Discourse on Sepulchral Urns* (1648). He wrote also *The Garden of Cyrus*, or the *Quincunxial Lozenge*; besides a variety of tracts, published after his death. His writings are highly prized by many for their genial fancy, pleasing quaintness of style, and varied erudition.

BROWNE, WILLIAM, an English poet, b. 1591, of whose life little is known, save that he was in Exeter college, Oxford, and was a tutor to an earl of Carnarvon. He was of the school of Spenser, and author of *Britannia's Pastorals*, and *The Shepherd's Pipe*. He d. about 1643.

BROWNELL, HENRY HOWARD, 1820-72; b. Rhode Island; educated at Trinity college, Hartford, and intended for the bar, but devoted himself to teaching and authorship. In 1847, he issued a volume of poems, after which came *The People's Handbook of Ancient and Modern History*; *The Discoverers, Pioneers, and Settlers of North and South America*, etc. Near the close of the civil war he was acting ensign on admiral Farragut's staff, and after the war accompanied the admiral to Europe. In 1866 he issued the volume *War Lyrics and other Poems*.

BROWNELL, THOMAS CHURCH, D.D., LL.D., 1779-1865; b. Mass.; graduated at Union college in 1804, where he was tutor and professor of chemistry and mineralogy. In 1810, he traveled in England and Ireland; and in 1816 was ordained a minister of the Protestant Episcopal church. In 1818 he was assistant minister of Trinity church in New York city, and in 1819 made bishop of Connecticut. It was under his care that Washington (now Trinity) college was founded, he being the first president. He was the author of *The Family Prayer Book*, and author and compiler of *Religion of the Heart and Life*.

BROWNIAN MOVEMENTS. The motion of non-living particles as seen through the microscope, often mistaken for motions of living matter. The cause of the movements has not been satisfactorily shown, but it has been surmised that heat is the motive power.

BROWNIE, a good-natured and invisible goblin in the old popular superstitions of Scotland, who attached himself to farm-houses and other country dwellings, and while the inmates were asleep performed their labors, churning, thrashing, etc., for them. In Cornwall, a similar *Brownie* was evoked to assist at the swarming of bees. The resemblance to the Robin Goodfellow (q.v.) of the English, and the Kobold of the Germans is conspicuous.

BROWNING, ELIZABETH BARRETT, one of England's most distinguished poets, was the eldest daughter of Edward Moulton, or Moulton-Barrett as he afterward wrote his name, and Mary Graham, and was born in Durham, March 6, 1806. Soon after, the family settled in Herefordshire. Elizabeth early displayed great precocity, eagerly read books beyond the comprehension of most children, and before she was eleven years of age, composed an "epic poem," *The Battle of Marathon*. Taking up the study of the classics in the original, she became intimately familiar with Greek literature, nor was she less acquainted with that of her own country and with philosophy and science. She began writing for literary periodicals in 1825, and in 1826 published anonymously *An Essay on Mind and other Poems*. In 1833 another anonymous volume appeared, *Prometheus Bound and Miscellaneous Poems*, giving evidence of unusual powers. After residing in Devonshire for a time, the family removed to London where Miss Barrett established her reputation by the publication of *The Seraphim and other Poems* (1838). The bursting of a blood-vessel in the lungs, added to the shock caused by the death in 1840 of a favorite brother, endangered her life, and for seven years she was confined to her room; but even here she resumed her labors and in 1844 published *Poems* including "The Cry of the Children," and "Lady Geraldine's Courtship" in which she praised Robert Browning's verse. Early in 1846 she met that distinguished poet and in Sept. they were married, against her father's wishes. Proceeding to Italy they made Florence their home, and there in 1849, a son was born, Robert Wiedemann Barrett, now known as an artist and poet. In 1850 a second edition of the *Poems* printed in 1844 came out, containing a new translation of the *Prometheus Bound* of Æschylus, and in 1851 *Aurora Leigh*, a semi-autobiographical poem. *Casa Guidi Windows* (1851) and *Poems before Congress* (1860) were inspired by her ardent sympathy with the movement to free Italy. By this time her health had begun to fail, and on June 30, 1861, she passed peacefully away. In 1862 Mr. Browning published a volume of verses by his wife, *Last Poems*; in 1863 her *Greek Christian Poets and the English Poets*; and in 1866 *Selections from the Poems of Elizabeth Barrett Browning* (2d series, 1880). The married life of these brilliant poets was singularly happy, and their mutual influence is clearly seen in their verse. Mrs. Browning was slight in figure, had brilliant eyes and an expressive face, was deeply spiritual, as all her writings show, was fascinating in conversation, and was erudite without being pedantic. Composing with great ease, she often employed false metres and fell into affectations, but it was well said of her that her diction was "at times sublime, and always musical and beautiful." The "Sonnets from the Portuguese," so called, written after her engagement to Mr. Browning, are unrivaled, of their kind, in the English language. See her *Letters to R. H. Horne*, edited by Mayer (1876); the *Life* by Ingram (Boston, 1888); Bayne's *Two Great Englishwomen*; and Sharp's *Life of Robert Browning* (1890).

BROWNING, ROBERT, one of England's most original and subtle poets, was born at Peckham, parish of Camberwell, a southern suburb of London, May 7, 1812, and was the son of Robert Browning a clerk in the Bank of England, and Sarianna Wiedemann, daughter of a shipowner at Dundee. The family was an ancient one, belonging to Dorsetshire, and according to the poet, the original name was De Bruni, while there is some reason for believing that the ancestral line comprised the Capt. Browning who commanded the ship which conveyed Henry V. to France before the battle of Agincourt, and Capt. Micajah Browning who raised the siege of Derry in 1689 by springing the boom across Lough Foyle and perished in the act. Physically a typical Englishman, mentally Browning was the product of several races, his parental grandmother having been a West Indian Creole, his maternal grandmother, a Scotchwoman, and his great grandfather Wiedemann, a German from Hamburg. Mr. Browning, senior, who out of hatred for slavery had sacrificed the sugar plantation at St. Kitts inherited from his mother, and had accepted the somewhat humble position of bank clerk, was a student of liberal education, an amateur poet and artist of more than average ability, and is described as having an extraordinary analytical faculty in elucidating complex criminal cases. Mrs. Browning, on her side, inherited from her father, who was an accomplished draughtsman and musician, intellectual and musical tastes, and was, withal, of an exalted and lovely character. In religious matters both the Brownings and Wiedemanns were Congregationalists. The future poet had a happy childhood, encouraged by his parents in his refined tastes and learning more from them than from the academy which he entered at the age of ten and where he remained four years. He had already at the age

of eight, read Pope's translation of Homer, and by the time he was twelve (1824) had written verses enough in a Byronic vein to form a volume. Fortunately, this failed to find a publisher, for in that same year the works of Shelley and Keats came into his hands and by revealing the possibilities of poetry, dissipated his youthful ideals and quickened his own development. After leaving the academy, Browning studied under a tutor, then attended a few lectures at University College, London, deciding to complete his education by travel on the continent and a more intimate acquaintance with foreign literature. His sympathetic father had left him free to choose his life work, and although he was at this time known as an artist and musician rather than a writer, evidently he had long felt a stronger drawing in the direction of authorship, and an early desire to produce a series of monodramatic epics illustrating the life of typical souls now revived itself urgently. Early in January, 1833, he put forth anonymously his first book, *Pauline*, written the year before; a poem showing the influence of Shelley, and immature as a whole, but abounding in passages of great beauty as John Stuart Mill and a few others were quick to acknowledge. In the autumn Browning went to Russia and from thence to Italy, returning in 1834 to Camberwell, where he began his *Paracelsus* (q.v.), a metaphysical drama, defending that brave but maligned scientist. This, published in 1835, was hailed by John Forster (q.v.) as a work of genius, and secured Browning the friendship of Macready the actor, for whom he wrote the historical drama *Stratford* (1837), which was successful but short-lived on the stage, owing to the financial condition of the theatre, and when revived in 1886 met with moderate success. From this time on until his marriage, Browning lived in London and its neighborhood, studying life, nature, and books, and at one time seriously thinking of combining literary work with the Independent ministry. In 1840 he published *Sordello*, the second in his series of dramatic monologues, but dating its inception back to 1834. This involved and, as it has been termed, wearisome but seductive poem, comprising 11,000 verses, and narrating the development of a typical poetic soul, was the favorite child of its author. The period 1841-46 was well filled by a series of pamphlets bearing the collective title *Bells and Pomegranates*, and beginning with *Pippa Passes*, a lyrical drama showing the power of unconscious influence, which received warm praise from Miss Barrett, afterwards Mrs. Browning. This remarkable group embraced the plays *King Victor and King Charles* (1842); *The Return of the Druses* (1843); *Colombe's Birthday* (1844), successfully acted in 1852; the tragedy *A Blot in the 'Scutcheon* (1843), produced at Drury Lane that same year; *Dramatic Lyrics* (1842), among them "Cavalier Tunes" and "In a Balcony"; *Dramatic Romances and Lyrics* (1845), including "How they brought the Good News," "A Lost Leader," and "The Flight of the Duchess," and closed with *A Soul's Tragedy* (1846). In 1846 Browning was married to Elizabeth Barrett, as related in the foregoing article, and after that date resided in Italy, spending with his wife some months in England and Paris, 1851-52, and in Normandy, 1858, and returning with his son to England after Mrs. Browning's death in 1861. Before this sad termination of an ideal married life, Mr. Browning had published (1850) *Christmas-Eve and Easter-Day*, a poem defending catholicity in religion; *Introductory Essay to Letters of Percy Bysshe Shelley* (1852); and *Men and Women* (1855), including "Evelyn Hope," "Fra Lippo Lippi," and other now well-known lyrics. Then followed *Dramatis Personæ*, containing, among other poems, "Gold Hair" and "Rabbi Ben Ezra"; *The Ring and the Book* (1868-69), an epic in 21,116 lines, dealing with the tyranny of the passions, and generally considered his masterpiece; *Balaustion's Adventure* (1871), including an English version of the *Alkestis* of Euripides; *Prince Hohenstiel Schwangau* (1871), a defense by the prince (Napoleon III.) of the doctrine of expediency; *Fifine at the Fair* (1872), a powerful discussion of a question in morals; *Red Cotton Night-Cap Country* (1873), the story of a famous Norman law case; *Aristophanes' Apology* (1875), including a transcript from Euripides; *The Inn Album* (1875), a tragic story of betrayal and suicide; *Packiarotto and other Poems* (1876), including "Hervé Riel"; *The Agamemnon of Æschylus* (1877); *La Saisiaz and The Two Poets of Croisic* (1878), the former asserting his belief in a future life; *Dramatic Idyls* (two vols., 1879-80); *Jocoseria* (1883), a number of narrative poems; *Ferishtah's Fancies* (1884), both Ferishtah and his stories being inventions; *Parleyings with Certain People* (1887), the characters serving as mouth-pieces for the poet's opinions on literary, artistic, and philosophical questions; *Asolando* (1889), poems on various subjects. The first complete edition of Browning's works (six vols.) was published in 1868.

From 1866 on, the poet lived in England, his sister Sarianna making her home with him, busying himself in many ways, but deeming no year complete without a trip to Italy or France. In 1867 he was elected an honorary fellow of Balliol College, Oxford, and also M.A. of the university, and at a late period received the honorary degree of LL.D. from Cambridge. In the autumn of 1889 he went to Venice to visit his son, and here a stealthily increasing affection of the heart culminated, and after a few days' illness he died quietly, on the 12th of December. His body, borne by a stately funeral procession of gondolas to the Isle of the Dead, was finally removed to England and interred, December 31st, with still more imposing ceremonies in the Poets' Corner in Westminster Abbey.

Browning was below the medium height, inclining to stoutness, with a ruddy complexion, large and bright gray eyes, fine features, a quickness of speech and gait, and a magnetic address which together with his liberal sympathy with humanity enabled him

to mingle freely with all classes. His love for Italy was as deep and intelligent as that of his wife, and like her he prized the society of Americans. He never lost his attachment for dissent, and was often a worshiper in churches of different non-conformist denominations. His religious faith was buoyant and unwavering and his optimism was in marked contrast to that of most of his literary contemporaries. Browning was one of the most erudite of poets, and those who rank him next to Shakespeare for his insight into the human mind declare that in the double capacity of poet and thinker he has had a powerful influence upon the spiritual and mental life of our age. Those who compare him with his friend and contemporary, Tennyson, grant that the former is more musical in versification and more artistic in style, but claim that Browning has more passion and more brilliancy and vigor of thought. Opposed to these are critics who, conceding Browning's eminence as a thinker, refuse to give him a high place among poets, insisting that he deliberately disobeyed the rules of his art by valuing substance above form, and that most of his subjects were essentially inartistic in their nature. The involved and inharmonic structure of much of Browning's verse, its supposed obscurity, its frequent pedantic digressions, forced rhymes, and affectations fatigue or repel the average reader, with whom he can never become popular; but he could write clearly and artistically, as many a splendid descriptive passage shows, and the fire, the pathos, and the music of many of his lyrics do not require a cultured mind to appreciate them. The "Browning Society" established in London in 1881 and the similar organizations formed throughout England and her colonies and the United States, have by their discussions and publications done much to increase the poet's popularity. See the *Browning Society Papers*; Furnivall's *Browning Bibliography*; Mrs. Sutherland Orr's *Handbook to the Works of Robert Browning* (1885); minor works by Symons and by Fotheringham (1887); the *Life*, with bibliography by Sharp (1890); and that by Mrs. Sutherland Orr (2 vols. 1891).

BROWNISTS, a name current in England toward the end of the sixteenth century and applied indiscriminately to all seceders from the established church, among whom Robert Browne, or Brown (q.v.), was especially prominent. His writings (1582-83) were widely read and did much to foster those principles upon which the Separatist churches of England and Holland and the later Independent and Congregational churches of England and America were founded, but the extreme independency he advocated together with his illiberality was so distasteful, and his return to the church of England was regarded as such a disgraceful relapse, that, in general, the Separatists repudiated the appellation "Brownists" as inappropriate and slanderous.

BROWNLOW, WILLIAM GANNAWAY, 1805-77; b. Va. He was bred to the carpenter's trade, but in 1826 became a Methodist minister, and was for 10 years an itinerant. He took part in politics, advocating the election of Adams in 1828. In 1837, he was editor of the *Knowville Whig*, and his bold and quaint utterances soon gave him a wide reputation. In 1856, he defended the Methodist church in a work called *The Iron Wheel Examined and its Spokes Extracted*. Two years later, with Rev. A. Pryne of New York, he discussed the question, "Ought American Slavery to be Perpetuated?" Brownlow defended slavery. In the secession he clung to the union as the best means of upholding the institutions of the south. For this he was arrested by the confederate government and sent out of their lines. He returned to Tennessee in 1864, and the next year was elected governor, and in 1869 was sent to the United States senate. He was ardent, fearless, and resolute, caring little for refinement in speech or action. He was popularly known as "Parson Brownlow," and as the "fighting parson."

BROWN PIGMENTS, a term in art applied to those substances in which the three primary colors unite in unequal proportions, red being in excess. B. P. are chiefly mineral, and are used sometimes in a raw but usually in a burned state. The most important are bister, asphaltum, umber, terra di sienna, Mars brown, Cassel earth, and brown madder. According to the pigment, the character of the color is a yellow-brown, red-brown, purple-brown, etc. See DYEING.

BROWN-SÉQUARD, CHARLES EDWARD, a French-American physiologist born in Mauritius, 1813. His father, Edward Brown, was a native of Philadelphia; his mother was French, of the name of Séquard. He took the degree of M.D. at Paris, 1846, and afterwards spent much of his time in America, investigating and lecturing. His researches have been extensive, furnishing many of the most important facts in physiology, particularly in regard to the nervous system. It was formerly supposed that Longet had shown that the posterior columns of the spinal cord conducted sensation to the brain, while the anterior columns transmitted motor impulses to the muscles. Belingeri, however, in 1823, claimed to have demonstrated that sensation was conveyed to the brain by the gray substance of the cord only. These observations have been confirmed by Brown-Séquard, who was also the first to demonstrate that the decussation of the sensory conductors is in the cord itself; and he has the reputation of having created the physiology of the sensory tract of the spinal cord. His experiments upon the transfusion of blood are also of great interest. Detached muscular parts of animals, after losing their irritability, were revived for a considerable time by injecting fresh, oxygenated blood into them. A remarkable experiment was the transfusion, into the carotid artery of a dog just dead from peritonitis, of blood from a living dog. The dead dog was sufficiently restored to be able to stand upon his feet and wag his tail, and make other motions. He died a second time, twelve and a half hours after. Insufflation was also employed. In

1864 Dr. Brown-Séguard was appointed professor of physiology and pathology of the nervous system, in Harvard university. Returning to France in 1869, he was appointed professor of experimental and comparative physiology at Paris. He was founder and editor of the *Journal de la Physiologie de l'Homme et des Animaux* from 1858 to 1863. He established *Archives de la Physiologie Normale et Pathologique* in 1869. In 1873 he practiced medicine in New York, and with Dr. E. C. Seguin published the *Archives of Scientific and Practical Medicine*. In 1878 he succeeded Claude Bernard as prof. of experimental medicine at the collège de France. He published *Lectures on the Diagnosis and Treatment of the Principal Forms of Paralysis of the Lower Extremities*, 8vo, London, 1861. In 1889, after a series of successful experiments upon himself, he advocated the use of vitalizing fluids in the bodies of animals as a means of prolonging and invigorating human life. He died April 2, 1894.

BROWNSON, ORESTES AUGUSTUS, LL.D., 1803-76; b. Vermont; a theologian and author. He was at first a Presbyterian, but soon became a Universalist preacher, and was an indefatigable writer in support of whatever he for the time adopted. In 1828, he went into politics and tried to establish a workingmen's party in New York, moved thereto by the ideas of Robert Owen. In 1832, he was enthusiastic over Dr. Channing, and became a Unitarian preacher; in 1836, he organized in Boston "The Society of Christian Progress," as a church of which he was pastor. About this time he published *New Views of Christianity, Society, and the Church*, which was a moderate attack on Protestantism. In 1838, he started the *Boston Quarterly Review*, which had existence for about five years, and was then merged in the *New York Democratic Review*. In 1840, he published *Charles Elwood, or the Infidel Converted*, a treatise in the form of a story, in favor of the Roman Catholic church, towards which the author was drifting, and which he joined in 1844. His *Works* were published in 19 vols. (New York, 1883-5).

BROWN SPAR, a name often given by mineralogists to certain varieties of dolomite (q. v.), or magnesia limestone, of not unfrequent occurrence, distinguished by a brownish or reddish color, and a pearly luster, upon account of which they are also sometimes called *pearl spar*.

BROWN'S TRACT, a tract of land, containing 210,000 acres, in the Adirondack mountain region in n. N. Y., extending across Herkimer co., and into Hamilton on the e. and Lewis on the w. It was purchased by Mr. N. Brown, the patron of Brown univ., R. I., from Alexander McComb, who had bought from the state abt. 4,000,000 acres at 8d. per acre, with the result of financial ruin to himself. The tract is magnificently wooded.

BROWNSVILLE, a borough in Fayette co., Penn., 55 m. s. of Pittsburg; pop. '90, 1417. The borough is on the Monongahela river, over which there is a large and expensive bridge, and is principally engaged in coal mining and manufacturing.

BROWNSVILLE, city and co. seat of Haywood co., Tenn., on the Louisville and Nashville railroad, 57 m. n.e. of Memphis; pop. '90, 2516. Brownsville is in a rich cotton district, and has a good trade; has also Wesleyan Female College, Brownsville Female College (Bapt.), and weekly newspapers.

BROWNSVILLE, a city, port of entry and co. seat of Cameron co., Texas; on the Rio Grande, and the Rio Grande railroad; opposite Matamoras, Mexico, with which it has a large trade. It has a Roman Catholic cathedral, a Convent of the Incarnate Word, churches of other denominations, private and public schools, newspapers, a federal building, and important commercial and stock raising interests. Fort Brown, a garrisoned United States post, is near by. Pop. '90, 6134.

BROWN UNIVERSITY, at Providence, R. I., founded in 1764, is the seventh American college in order of date. Its origin is due to the desire of the Philadelphia Baptist Association to secure for the ministry of the denomination an education free from the restrictive influences prevailing at the existing colonial colleges.

In 1762 the Rev. Morgan Edwards was chosen to take the preliminary steps, and in 1763 the Rev. James Manning was sent to Newport to obtain support for the college. Rhode Island was selected not only on account of the numbers and influence of the Baptists among its population, but especially because it offered absolute religious freedom. Here, after some difficulties, a charter was obtained in 1764. Its principal provisions are: that no religious tests shall ever be allowed for admission of applicants; all sectarian teachings forever excluded from the college course; equal privileges for all Protestant denominations; professors chosen without regard to denominational views; the president always to be a Baptist; the government to be by a Board of Fellows consisting of twelve members, eight of whom, including the president, are to be Baptists, and by a Board of Trustees, of thirty-six members, of whom twenty-two must be Baptists; five, Quakers; four, Congregationalists; and five, Episcopalians. Within recent years an Advisory Committee composed of the secretaries of the various alumni associations has been instituted. In April 1764, Mr. Manning settled in Warren, and opened a Latin school, preparatory to a beginning of college instruction, and, the next year, was appointed president. He was not only a graduate of Princeton, but a young man of superior ability, and the school soon became a flourishing affair. In 1767 Mr. Edwards went to England to solicit aid for the college, and, as he said, "considering the feeling on account of the stamp act," was very successful. In 1769, the first class, consisting of seven young men, was graduated. The commencement exercises awakened anew the

interest felt in the college, and the contest as to its permanent location was finally settled by the proposition that it should go to the county raising the most money. Providence raised over \$20,000, and in 1770 the school removed there. That spring the foundations of the first college building, University Hall, were laid on the crest of a hill overlooking the town, bay, and surrounding country. The plot consisted of eight acres originally owned by Chad. Brown, associate and friend of Roger Williams. The preparatory school was also transferred to Providence, and under the name of the University Grammar School still continues as an auxiliary of the college. College instruction was suspended from 1776 to 1782 on account of the war, and the building was occupied by troops. In 1804 the name of the institution was changed from Rhode Island College to Brown University, in honor of Nicholas Brown, of the class of 1786, whose benefactions in all amounted to \$200,000.

The academic year consists of three terms with two recesses. It begins on the third Wednesday in September and ends on the third Wednesday in June, and covers about thirty-six weeks. The courses of instruction form a system of required and elective study. The studies of the freshman year are nearly all required. Since 1894, candidates for the degrees of Bachelor of Arts and Bachelor of Philosophy have been allowed large liberty in the choice of studies. Candidates for the degree of Bachelor of Science are allowed less freedom of election, in order that they may thoroughly master the branches necessary to a proper equipment in science, while to candidates for the strictly professional degrees of Civil Engineer and Mechanical Engineer no option is allowed. The elective studies, which are very numerous, are so placed in the curriculum as to give all the freedom of choice which the necessary limitations of the schedule of lectures allow. This schedule provides a number of parallel courses, each unitary and progressive and extending through the last three years. Every student is advised to adopt, in the main, one of these courses. The income of about one hundred scholarships is available for needy but deserving students. There is also an aid fund, the income of which may be employed as a gift or a loan.

The libraries number 90,000 volumes besides 20,000 pamphlets. They include the main library and the various department libraries, of which the most important are the Harkness Classical Seminary Library, the Romance Seminary Library, the Chemical Department Library, the Bancroft English Library, and the Conant German Seminary Library, the last containing over 6,500 choice volumes. In the main library is included the Harris Collection of American Poetry, numbering 6,000 volumes. The library fund amounts to \$57,000, including three special funds for works on History and Botany. The Jenks Museum of Zoology, the Museum of Anthropology, the Olney Herbarium, and the Museum of Classical Archaeology are all well equipped with illustrative material for the work of the departments represented. An important collection of historical portraits is exhibited in Sayles Hall. The Ladd Astronomical Observatory is furnished with a 12-inch equatorial and necessary minor apparatus. The Physical Laboratory occupies a new and costly building of its own. The Anatomical, Chemical, Botanical, Psychological and Mechanical Engineering Departments all have important laboratories. The Gymnasium is of recent construction and well equipped. Exercise is required of all students. The buildings are fifteen in number, ranging in date from 1770 to 1897. The endowments amount to \$1,100,000.

The Women's College was founded in 1892. All instruction is given by the University faculty, and all examinations, degrees, and graduate courses are open to women. The present number of woman students is 157. The total number of students in the University in 1897 is 908. The total number of graduates is 4,646, of whom 2,174 are living. The officers of instruction number 80.

The presidents have been: James Manning, 1764-91; Jonathan Maxcy, 1792-1802; Asa Messer, 1802-26; Francis Wayland, 1827-55; Barnas Sears, 1856-67; Alexis Caswell, 1868-72; E. G. Robinson, 1872-89; E. B. Andrews, 1889-97. See *Manning and Brown University*, 1864; and *History of Brown University*, 1897, by R. A. Guild; also *History of Higher Education in R. I.*, 1894, by W. H. Tolman.

BRUCE, BLANCHE K., born in slavery in Prince Edward co., Va., in 1841; was educated in his master's house; taught school in Mo.; studied at Oberlin college and privately; removed to Mississippi, and in 1869 became a planter; served as sheriff of Bolivar co. 1871-74; was co. supt. education 1872-73; U. S. Senator 1875-81; register of U. S. treasury 1881-85; and was appointed recorder of deeds in the District of Columbia in 1890.

BRUCE, the surname of a family illustrious in Scottish history, descended from Robert de Brui, a Norman knight, who accompanied William the Conqueror to England in 1066, and died soon after. His younger son, Adam, who acquired large possessions in Yorkshire, left a son, Robert de Brus of Cleveland, a companion in arms of prince David of Scotland, afterwards David I., from whom he received a grant of the lordship of Annandale, held by the tenure of military service. At the commencement of the war in England between Stephen and Matilda, niece of the king of Scots, Robert de B. adhered to the former, and renounced his allegiance to David, resigning his lands in Annandale to his son Robert. In 1138, he was sent by the barons of the north of England to negotiate with David, who had advanced in support of his niece's claims as far as Northallerton, Yorkshire. In the battle of the Standard which followed, he took prisoner his son Robert, then 14 years of age, who, as lord of Annandale, fought on the Scottish side. He died in 1141. His English estates were inherited by his eldest son, Adam, whose male line terminated in Peter de B. of Skelton, constable of Scarborough castle in 1271. Robert de B., 2d lord of Annandale, had two sons: Robert—who married a natural

daughter of William the Lion, and died, without issue, before 1191—and William, whose son, Robert, 4th lord of Annandale, married Isobel, 2d daughter of David, earl of Huntingdon and Chester, brother of William the Lion, and thus laid the foundation of the royal house of Bruce. He died in 1245.

BRUCE, DAVID, son of king Robert Bruce, succeeded his father, in 1329, as David II., when only 5 years old. In terms of the treaty of Northampton, he had married, when 4 years old, Joanna, daughter of Edward II. of England, and on 14th Nov., 1331, he was crowned with her at Scone. In 1333, the success of Edward Baliol and the English party obliged David's guardians to send him and his consort to France; but on the dispersion of Baliol's adherents, David returned to Scotland in 1341. He made three unsuccessful inroads into England, and on a fourth invasion, in 1346, was taken prisoner at the battle of Neville's Cross, near Durham, and conveyed to the tower of London. Thence he was removed to Odiham, in Hampshire, and not released till 1357, when his ransom was fixed at 100,000 marks. His queen dying in 1362, he married Margaret Logie, a Scottish gentlewoman of singular beauty, whom he divorced in 1370. He had no issue; and in his latter years, he was engaged in several intrigues with England, with the view of excluding his nephew, Robert, the steward of Scotland, the next heir, from the throne. He died at Edinburgh castle, Feb. 22, 1371.

BRUCE, EDWARD, king of Ireland, uncle to the above, a chivalrous but rash and impetuous prince, was actively engaged in the struggle for Scotland's independence; and in 1308, after defeating the English twice, made himself master of Galloway. In 1315, the chieftains of Ulster tendered to him the crown of Ireland, on condition of his assisting them to expel the English from the island. With a small army of 6000 men, he embarked at Ayr, and reached Carrickfergus, May 25th of that year, accompanied by sir Thomas Randolph, earl of Moray, sir John of Soules, sir John the Stewart, sir Fergus of Ardrossan, and other Scottish knights of renown. His rapid victories soon made him master of the province of Ulster, and he was crowned king of Ireland, May 2, 1316, but was slain at the battle of Dundalk, in 1318.

BRUCE, GEORGE, 1781-1866; b. Scotland, went to Philadelphia in 1795 as a printer, and in 1803 became publisher of the *New York Advertiser*. In 1812, he and his brother introduced the art of stereotyping, and followed that and type-founding thereafter. One of the nephews was the inventor of a machine for casting types.

BRUCE, JAMES, a celebrated traveler, born at Kinnaird house, Stirlingshire, Dec. 14, 1730, was the eldest son of David Bruce, esq., of Kinnaird, and Marion Graham of Airth. Educated at Harrow, he was sent, in the winter of 1747, to the university of Edinburgh, with the intention of studying law; but changing his views, he went to London, and having, in Feb., 1754, married the daughter of a wine-merchant's widow, became a partner in the business. His wife dying within a year, he made a tour on the continent, and on his father's death in 1758, he succeeded to the estate of Kinnaird. In 1761, he retired from the wine-trade, and in 1763 was appointed consul-general at Algiers. He remained there about two years, studying the oriental languages, and acquiring the rudiments of surgery. He then went to Aleppo, where he took further instructions in the medical art, being resolved to travel in the character of a physician. In June, 1768, he proceeded to Alexandria and from Cairo set out on his famous journey to Abyssinia, which forms an epoch in the annals of discovery. Sailing up the Nile to Syene, he crossed the desert to Cosseir, and arrived at Jeddah in April, 1769. After various detentions he reached Gondar, the capital of Abyssinia, in Feb., 1770; and on Nov. 14 of that year, succeeded in reaching the sources of the Abawi, then considered the main stream of the Nile. This accomplishment of the chief object of his journey filled him with the greatest exultation. He remained about two years in Abyssinia, and returning by way of Sennaar and the desert of Assouan, after great hardship reached Alexandria, whence he embarked, Mar., 1773, for Marseilles. In France he spent a considerable time, visiting the celebrated count de Buffon, and other distinguished men, and in 1774, he returned to Scotland. In 1776, he married Mary, daughter of Thomas Dundas, esq., of Fingask, by whom he had two sons and one daughter. His long-expected *Travels to Discover the Sources of the Nile, in the Years 1768-73*, were published in 1790, in 5 large 4to vols. with plates and charts. The work contained such curious accounts of the manners and habits of the people of Abyssinia, that it startled the belief of many, and some of them were set down as fabrications. Among other doubters were De Tott in France, and Dr. Johnson in England. Modern travelers, including Salt, Pearce, Burckhardt, Belzoni, and others, have, however, fully confirmed his statements. B. died April 27, 1794, at Kinnaird, of a fall down stairs.

BRUCE, MICHAEL, a minor Scottish poet, the son of a weaver, b. at Kinnesswood, Kinross-shire, Scotland, Mar. 27, 1746, was, in his younger years, employed as a herdsboy. In 1762, he was sent to Edinburgh University to study for the ministry, and when not at college, was engaged as a village schoolmaster. He had all his life to struggle with poverty, and his frame being weak, melancholy took possession of his mind, and his constitution began visibly to decline. He died of consumption, July 6, 1767, aged 21. His poems, few in number, and of a tender and pathetic description, were published by the Rev. John Logan, his fellow-student and associate at college, at Edinburgh in 1770. His last composition was a touching elegy on his own approaching death.

BRUCE, ROBERT, the most heroic of the Scottish kings, was b. Mar. 21, 1274. In his youth he favored the English interests, in the expectation, doubtless, of his father being preferred to the Scottish throne. In 1296, as earl of Carrick, he swore fealty to Edward I. at Berwick, and the following year he renewed his oath of homage at Carlisle. Shortly after, he abandoned the cause of Edward, and, with his Carrick vassals, joined the Scottish leaders in arms for the independence of their country. On the defeat of the Scots, a few months afterwards, at Irvine, B. made his peace with the English monarch. After Wallace's defeat at Falkirk, B. burned the castle of Ayr to the ground, to prevent its falling into the hands of the English, and retired into the recesses of Carrick. In 1299, the year after Wallace had resigned the regency, B., then in his 25th year, was admitted one of the four regents, who ruled the kingdom in the name of Baliol. In the three campaigns which subsequently took place, previous to the final subjugation of Scotland, B. continued faithful to Edward, and in 1305 was consulted in the settlement of the government. With John Comyn, called the Red Comyn, the nephew of Baliol, he appears to have entered into some agreement as to their rival claims to the throne. In an interview between them, in the church of the Minorite Friars, Dumfries, Feb. 4, 1305-06, a quarrel took place, and B., in a paroxysm of passion, stabbed Comyn with his dagger. Rushing out to his attendants, he exclaimed: "I doubt I have slain the Red Comyn." "You doubt!" cried one of them; "I mak sikker!" (i.e., sure), and, running into the church with some others, slew Comyn and his brother, who attempted to defend him. B. hastened to Lochmaben castle, assembled his vassals, and asserted his right to the throne. Two months after (Mar. 27), he was crowned king at Scone. An English army, under the earl of Pembroke, nominated by Edward governor of Scotland, took possession of Perth, and on the night of the 18th June, attacked B. in the wood of Methven, compelling him to retreat into the wilds of Athole. At Dalry, near the head of Loch Tay, B. was attacked by Alexander, lord of Lorn, chief of the Macdougals, husband of the aunt of the Red Comyn, and compelled to retire. Sending his queen and her ladies to Kildrummie castle, Aberdeenshire, under the charge of Nigel Bruce and the earl of Athole, he, with 200 followers, crossed Loch Lomond, and had recourse for subsistence to the chase. B. next took refuge in the little island of Rathlin, on the n. coast of Ireland, where he remained all winter, and was supposed to be dead. In his absence, the English took the castle of Kildrummie, hanged Nigel Bruce and other chiefs who had defended it, and tore the queen and princess Marjory from the sanctuary of St. Duthac, Ross-shire. All B.'s estates were confiscated, and himself and adherents excommunicated by the pope's legate at Carlisle. In the spring of 1307, with about 300 men, B. landed in Carrick, and at midnight surprised the English garrison in his own castle of Turnberry; but before a superior force he retired into the mountainous districts of Ayrshire. At Loudon hill, May 10, 1307, he defeated the English under the earl of Pembroke, and, three days after, overthrew another party under the earl of Gloucester. In less than two years he wrested from the English nearly the whole of Scotland. His authority being now established, in 1309 B. advanced to Durham, laying waste the country. The same year, Edward II. of England invaded Scotland, but was compelled to retreat from Edinburgh to Berwick-upon-Tweed. In the harvest of 1312, the Scots again invaded England, but unsuccessfully. B. now reduced the Isle of Man also. On his return, in the autumn of 1313, he found his brother, Edward Bruce, engaged in the siege of Stirling castle, held by sir Philip Mowbray for the English. A treaty was entered into, by which Mowbray bound himself to surrender it, if not relieved before 24th June following. This led to the memorable battle of Bannockburn, 24th June, 1314, at which B. commanded in person. The English, under Edward II., amounting, it is said, to about 100,000 men, were totally routed, leaving 30,000 dead upon the field; while the Scots, numbering only 30,000, and 15,000 camp-followers, lost about 5000. In 1317, B. passed over to Ireland, to assist his brother, Edward, elected king of that country, and defeated the Anglo-Irish under the baron of Clare; and in the spring of 1318 the Scots army invaded England by Northumberland. Another invasion of Scotland by the English king, who was compelled to retreat, was followed by B. again marching into England. After besieging Norham castle, he defeated Edward once more at Biland abbey, Yorkshire. A truce was, in consequence, ratified between the two kingdoms at Berwick, June 7, 1323, to last for 13 years. On the accession of Edward III., in 1327, hostilities recommenced; and the Scots being again victorious, a final treaty was ratified in a parliament at Northampton, Mar. 4, 1328, recognizing the independence of Scotland, and B.'s right to the throne. His warfare was now accomplished, and, suffering under the disease of leprosy, he spent the last two years of his life at Cardross castle, on the northern shore of the firth of Clyde. He died June 7, 1329, in his 55th year, and the 23d of his reign. His heart, extracted and embalmed, was delivered to sir James Douglas, to be carried to Palestine and buried in Jerusalem. Douglas was killed fighting against the Moors in Spain, and the sacred relic of B., with the body of its devoted champion, was brought to Scotland, and buried in the monastery of Melrose. B.'s body was interred in the abbey church of Dunfermline; and, in clearing the foundations for a third church on the same spot in 1818, his bones were discovered. He was twice married: (1) to Isabella, daughter of Donald, tenth Earl of Mar—issue, a daughter, Marjory, wife of Walter the high steward, whose son ascended the throne as Robert II.; and (2) to Elizabeth, daugh-

ter of Aymer de Burgh, earl of Ulster—issue, one son, who succeeded him as David II., and two daughters.

BRUCE, ROBERT DE, fifth lord of Annandale, son of the fourth lord above mentioned, and the competitor with John Baliol for the crown of Scotland, was b. in 1210. On the death of his mother, the princess Isobel, in 1252, he did homage to Henry III. for her lands in England, and in 1255 was made sheriff of Cumberland, and constable of the castle of Carlisle. About the same time he was appointed one of the fifteen regents of Scotland, in the minority of Alexander III. In 1264, he led, with Comyn and Baliol, the Scottish auxiliaries to the assistance of the English monarch at the battle of Lewes, where he was taken prisoner, but released after the battle of Evesham, the following year. On the Scottish throne becoming vacant at the death, in 1290, of Margaret, the "maiden of Norway," granddaughter of Alexander III., Baliol and Bruce claimed the succession, the former as great-grandson of David, earl of Huntingdon, by his eldest daughter, Margaret; the latter as grandson, by his second daughter, Isobel. Edward I. of England, to whom the dispute was referred, decided in favor of Baliol, 19th Nov., 1292. To avoid swearing fealty to his successful rival, B. resigned Annandale to his eldest son, Robert de B., earl of Carrick. He died at his castle of Lochmaben, Dumfriesshire, in 1295, leaving three sons and a daughter.

BRUCEA, a genus of shrubs somewhat doubtfully referred to one of the allied natural orders *rutaceæ* (q.v.), *simarubaceæ* (q.v.), and *xanthoxylaceæ* (see *XANTHOXYLUM*).—*B. antidysenterica*, or *feruginea*, is an Abyssinian species, the leaves of which are said to be tonic, astringent, and useful in dysentery. Those of *B. Sumatrana*, a native of the Indian archipelago, China, etc., possess the same medicinal properties. They are intensely bitter.—The Abyssinian species acquired a factitious importance in the beginning of the 19th c., from a mistaken belief that it produced the dangerous false Angostura bark (see *ANGOSTURA BARK*), and in this belief the name *brucine* (q.v.) was given to an alkaloid really produced by the *nux vomica* (q.v.) and other species of *strychnos* (q.v.).

BRUCH, MAX, b. Cologne, 1838; at an early age showed remarkable talents for musical composition; held the Mozart scholarship, 1853-57; and in 1863 brought out the opera of *Lorelei*, on Geibel's libretto, written for and partly set by Mendelssohn. In 1865 he was made musical director of the Concert-Institution in Coblenz, and in 1867 became kapellmeister to the prince of Schwarzburg-Sondershausen. In 1870 he went to Berlin, and has since lived there and at Bonn. He visited the United States in 1883, and conducted his oratorio, *Arminius* in Boston. Max Bruch ranks among the first musicians of Germany as the representative of the epic cantata. His works include orchestral and chamber-music; the operas *Jungfrau von Orleans*, Cologne, 1859; and *Hermione*, Berlin, 1872; *Römischer Triumphgesang*, for male chorus and orchestra, op. 19; the cantatas *Frithjof*, *Salamis*, *Normannenzug*, *Die Flucht der heiligen Familie*, op. 20; *Schön Ellen*, op. 24; *Odysseus*, op. 41; *Das Lied von der Glocke* (Schiller's poem), op. 45; and *Achilleus*, op. 50. The *Scenes from the Frithjof Saga* are the best known of his orchestral works.

BRUCHSAL, a t. of the grand duchy of Baden, situated on the Salzbach, and on the railway between Heidelberg and Karlsruhe, 12 m. n.e. of the latter place. B., which is a place of considerable antiquity, has three suburbs. The old castle of the prince-bishops of Speier, who took up their residence here early in the 11th c., is still standing, and in the church of St. Peter are some ancient tombs. B. has a penitentiary organized on a modified form of the Pennsylvanian system. It is an important railway centre. Pop. '90, 11,902.

BRUCINE is one of the alkaloids (q.v.) present in *strychnos nux vomica* along with strychnine, etc. It is not so abundant as the strychnine, nor is it so poisonous. It is mainly characterized by giving a blood-red color with concentrated commercial nitric acid, and, indeed, the red color always yielded by *nux vomica*, and occasionally by strychnine when treated with nitric acid, is due to the presence of brucine.

BRUCITE, a native magnesian hydrate, found in serpentine in New Jersey, and in the chrome mines in Texas. Syn. MgH_2O_2 .

BRÜCKENAU, a village of Bavaria, on the Sinn, 36 m. n.e. of Würzburg. It is famous in connection with the baths of B., which are picturesquely situated in a beautiful part of the valley of the Sinn, about 2 m. w. from the village. The grounds are tastefully laid out in gardens, and charming walks traverse the surrounding woods. The place is a favorite summer-resort of the Bavarian court. B. has paper-mills. Pop. 2000.

BRUCKER, JOHANN JAKOB, a German theologian and historian, 1696-1770. He was educated at Jena, where he took the degree of A.M. in 1718, and devoted himself to the study of the history of philosophy. In 1723 came *Historia philosophica doctrinæ de ideis*, and in 1731 he was chosen a member of the Berlin academy of sciences. Thence he went to Augsburg as pastor of the church of St. Ulric, where he published dissertations on the history of philosophy, and still later a history of philosophy in dialogue form. In 1741 came the first volume of his great work on the critical history of philo-

sophy, completed in 1744, a work that had an immense success. He wrote many other works on philosophical subjects, and superintended and corrected an edition of Luther's translation of the New Testament, but did not live to complete it.

BRUGES (Ger. *Brügge*), a city of Belgium, capital of the province of West Flanders, is situated in a fertile plain about 8 m. from the sea, with which it is connected by the three canals from Ghent, L'Ecluse, and Ostend, the latter admitting the largest sea-going ships. Lat. 51° 12' n., long. 3° 14' e. B. derives its name from its many bridges, all opening in the middle to admit of the passage of vessels. The ramparts surrounding the city are an agreeable promenade. The streets have a venerable and picturesque appearance, but they no longer present the scene of activity which characterized the city in the later Middle Ages, when it was one of the trading posts of the Hanseatic League. Among the most interesting buildings are the town-hall, with a lofty tower and a celebrated set of 48 bells; a Gothic senate-house, built about the close of the 14th c.; a court of justice, containing a famous carved chimney-piece of the date 1559; the church of Notre Dame, with its spire 450 ft. high, its many valuable paintings, and a statue of the Virgin (said to be by Michael Angelo), for which Horace Walpole offered 30,000 florins, and its splendid monuments of Charles the Bold and his daughter Mary, wife of the emperor Maximilian; the cathedral of St. Sauveur, not remarkable for its exterior, but containing paintings by eminent masters; St. John's hospital, with celebrated pictures by Memling, etc. The academy of painting contains several fine pictures by J. van Eyck. B. is still an important commercial port, and has various manufactures and shipbuilding yards. Railways connect B. with Ostend, Ghent, and other cities of Belgium and the continent. Its population in 1894 was 49,342. B. is a very ancient city. Here, it is said, St. Chrysolus preached the gospel as early as the 3d century. In the 7th c., B. was the capital of the surrounding district called Flanders, and before the conquest of England by the Normans its commercial importance was established. In the beginning of the 13th c., it was the central mart of the Hanseatic league; and in the following century it may be said to have become the metropolis of the world's commerce. Commercial agents from 17 different kingdoms resided here, and no less than 20 ministers from foreign courts had mansions within its walls. Its population at this time amounted to upwards of 200,000. In 1488, the citizens rose in insurrection against the archduke Maximilian, and with the harsh measures of repression which ensued, commenced the commercial decline of Bruges. Many of the traders and manufacturers, driven forth from their own country, settled in England, and from this time may be dated the beginning of English manufacturing superiority. In the 16th c., however, the tapestry of B. was still celebrated throughout Europe, and the famous Gobelin tapestry of Paris is said to owe its origin to a manufacturer of Bruges. The city was taken by the French in 1794, and soon after incorporated with the French empire; but in 1815 it became a part of the kingdom of the United Netherlands, and in 1830 of the Belgian monarchy.

BRUGG, or **BRUCK**, a village of Switzerland, in the canton of Aargau, on the right bank of the Aar, and near the mouth of the Reuss, about 9 m. n.e. of Aarau. It is interesting as the birthplace of many theologians, being known as the "Prophets' Town" during the Reformation; and also as the cradle of the house of Hapsburg, to whom, in early times, it belonged. Pop. about 2000.

BRUGMANN, KARL, was born in Wiesbaden, in 1849, studied at Halle, Leipsic, and Bonn; from 1872-77 he was instructor in the gymnasium, and in 1877 entered Leipsic university in the department of Sanscrit and comparative philology. Here he was appointed professor in 1882; was called to Freiburg in 1884, and in 1887 returned to Leipsic. With Osthoff (of Heidelberg), Brugmann is the most active representative of the so-called *junggrammatischen* movement, which, as well as physiology of sound, must be regarded as the result of physical factors; since, according to Brugmann's and Osthoff's view, these affect all sound-waves and acoustics, as well as all so-called formations by analogy. Moreover, this new movement accords with the following laws of Leskien: (1) all sound-changes, produced mechanically, develop according to laws without exceptions; (2) new language formation by analogy, as it plays an important part in the life of modern languages, must be recognized and expected in earlier as well as the earliest periods. On these principles rest Brugmann's *Morphologischen Unterforschungen auf dem Gebiet der indogermanischen Sprachen*, published in connection with Osthoff. Among Brugmann's works on special subjects are: *Vergleichende Grammatik der indogermanischen Sprachen*, and also a number of articles which he contributed to Curtius' *Studien zur griechischen und lateinischen Grammatik*.

He has also written a work on the text criticism of Homer (1876); on the popular songs and stories of the Prussian and Russian Lithuanians (1885). His great treatise on the comparative grammar of the Indo-Germanic languages has been translated into English, the first volume appearing in 1888. The discoveries and deductions of Brugmann, Ascoli, Verner, and Osthoff have wrought a complete revolution in the science of comparative philology, more especially in the views held concerning the vocalization of the original tongue. He also became one of the editors of the *Indogermanische Forschungen*.

BRUGMANS, SEBALDUS JUSTINUS, 1763-1819; a Dutch naturalist and physician, professor of philosophy and physical sciences at Franeker, Holland, where he founded a museum of comparative anatomy. He organized and became chief director of the

sanitary institutions of Holland. He improved the condition of military hospitals, and by his effort the 20,000 soldiers wounded at Waterloo were properly cared for.

BRUGSCH, HEINRICH KARL, PH.D., b. 1827; a German Egyptologist, and director of the Egyptian museum in Berlin. He made two visits to Egypt for archaeological purposes, and was a member of the Prussian embassy to Persia in 1860. In 1864, he founded at Leipsic a periodical devoted to Egyptian archaeology. At Göttingen he was professor in 1868-70, when he became director of an Egyptological school at Cairo. He received the titles of Bey and of Pasha, and in 1881 succeeded M. Mariette as keeper of the Egyptian collections at Boulak. His principal works are *Egyptian Monuments*, 1862-66; *History of Egypt from the Earliest Times to the Present Day*, vol. I., 1859; *A Dictionary of Hieroglyphics*, 1867-68; *The Exodus and the Egyptian Monuments*, 1875, etc. He died Sept. 10, 1894.

BRÜHL, a t. of Rhenish Prussia, about 9 m. s.s.w. of Cologne, on the railway to Bonn. It is surrounded by old walls, and has a splendid château, erected in the early part of the 18th c. by the elector Clement Augustus of Bavaria. Pop. 4000.

BRÜHL, HEINRICH, Count von BRÜHL, prime-minister of Augustus III., king of Poland, and elector of Saxony, deserves a place in history as a signal example of an unworthy minister and venal statesman. He was born in 1700, at Weissenfels, and in early life entered, as a page, into the service of the duchess of Sachsen-Weissenfels. His winning address and tact gained for him rapid promotion through several offices of state, until, in 1747, he became prime-minister to that idle and unpatriotic ruler, Augustus III. Never was a ruler more slavishly obeyed by a statesman. B. would follow the prince, as he strolled about smoking, without speaking a word for a whole day; or, when his majesty lazily inquired: "Brühl, have you any money for me?" "Yes, sire," would be the constant reply; but in order to be able to give this answer as frequently as it was demanded, B. drained the coffers of the state, and burdened the country with debt. He, however, contrived to enrich himself, and to accumulate honors and titles. By Elizabeth of Russia, he was invested with the order of St. Andrew, and by Charles VI. of Austria, he was made a count of the empire. He kept 200 servants, paid his body-guard better than Augustus did his, furnished the costliest table, possessed the finest wardrobe, and, in short, maintained the most splendid establishment in the kingdom. "Of all statesmen," said Frederick II., "Brühl has collected the greatest quantity of fine clothes, watches, lace, boots, shoes, and slippers!" The effect of B.'s reckless robbery of the national finances to gratify the dissolute Augustus and himself, made itself felt at the outbreak of the seven years' war, when the country could only furnish 17,000 men to oppose Frederick of Prussia, who surprised and captured the whole Saxon army in its camp at Pirna. Augustus and B. fled to Warsaw. When peace was concluded, they returned to Dresden, where Augustus died on the 5th Oct., 1763, and was followed by his worthless parasite, 28th October.

BRUISE, or **CONTUSION**, signifies an injury inflicted by a blow or sudden pressure, in which the skin is not wounded, and no bone is broken or dislocated. Both terms, and especially the latter, are employed in surgery to include all such injuries in their widest range, from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood-vessels, which occasions the discoloration that is always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissue, vessels, etc.—are more or less ruptured, and in extreme cases, are thoroughly crushed, and usually become gangrenous. The quantity of blood that is extravasated mainly depends upon the size and number of the ruptured blood-vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favors the escape of blood into the surrounding parts. Moreover, the constitution of the patient has some influence, and many persons, especially (according to Mr. Paget, in his article on "Contusions" in Holmes's *System of Surgery*, vol. i.) pallid, fatty, soft-skinned women, though suffering from no apparent disease, are subject to extravasations, and consequently to discolorations, very disproportionate to the injuries that cause them.

The most characteristic signs of a recent contusion are more or less shock (q.v.), pain, swelling, and discoloration of the surface from effused blood (commonly known as *echymosis*, q.v.). There is nothing special in the character of the shock, but it is worthy of notice that it is most severely felt in injuries of special parts—as the testes, the breasts, and the larger joints, which are often followed by remarkable general depression, faintness, loss of muscular power, and nausea. The immediate pain following the blow is succeeded by a feeling of numbness, which, after a varying time, unless the part is killed, gives place to a heavy, aching pain. Although some depression may usually be observed immediately after the infliction of the blow, swelling of the parts rapidly follows, as may be well seen in the case of a child receiving a blow on the head, or of the wale that rises after the lash of a whip. In lax parts, such as the eyelids, the swelling is often considerable, and may remain for a week or more; but in other parts, it usually subsides in two or three days. The discoloration of the skin consequent on blows is of a more or less purple tint, varying from black to crimson or pink. "Black-

ness," says Mr. Paget (*op. cit.*), "usually indicating intense injury, is probably due to cure, and there is no inflammation or sloughing, the effused blood is generally absorbed, the liquid portion rapidly disappearing, while the blood-cells are more slowly removed. In some cases, it is probable that the effused blood becomes organized into vascular connective tissue, which takes part in the repair of the injured tissue. We need not follow the course of a B. in which active inflammation with suppuration ensues, or in which sloughing takes place, as these complications must be treated according to the ordinary rules of those affections. There are, however, one or two ill consequences following partial recovery, which require notice. Thus, in some organs, as the breast, abscess may ensue long after a blow; or a sensitive indurated lump may remain; or (more commonly) there may be long-continued pain, without change of texture; or, lastly, cancer may ensue. Blows on superficial bones, as those of the skull, are not unfrequently followed by very painful thickening of the periosteum; and a muscle violently struck may be paralyzed, and rapidly waste away; and constitutional diseases, such as gout and rheumatism, are well known to localize themselves with special severity in parts that have once been seriously bruised.

With regard to treatment, simple and not very severe bruises require little treatment but the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid.

BRULÉ, a co. in S. Dakota; formed 1875. Area, 825 sq.m.; pop. 1890, 237. Co. seat, Chamberlain.

BRÜLL, IGNAZ, pianist and composer, b. in Prossnitz, Moravia, Nov. 7, 1846. He studied the pianoforte under Epstein, and composition under Ruffinatscha and Dessoff, and appeared in concerts in Vienna and London with success. His works for the orchestra have given him fame as a composer, and he has also written chamber-music and several operas, which have taken a place in the modern repertory. These include: *Das goldene Kreuz* (Berlin; 1875); *Königin Marietta* (Munich, 1883); and *Das Steinerner Herz* (Vienna, 1888).

BRUMAIRE (Lat. *bruma*, winter), a division of the year in the republican calendar of France. It includes the time from Oct. 22 to Nov. 20. The celebrated 18th B., which witnessed the overthrow of the directory and the establishment of the sway of Napoleon, corresponds with Nov. 9, 1799, of the Gregorian calendar. See CALENDAR.

BRUMIDI, CONSTANTINE, 1805-80; a native of Rome, Italy, son of a Greek father and an Italian mother, widely known as a fresco painter. He was educated in the college of fine arts at Rome, and came to the United States in 1852. His first work, "The Crucifixion," was in St. Stephen's church in New York. Thence he went to Philadelphia and to the city of Mexico, at both places employing himself in church decoration. In 1854 he arrived in Washington, and was at once employed on the bare walls and ceilings of the national Capitol, the rotunda of which contains many fine pieces from his hand, combining mythology, allegory, and history. He left untouched or unfinished several accepted cartoons in his series, including "Oglethorpe and the Indians," "The Battle of Lexington," "Surrender of Cornwallis," "Decatur at Tripoli," "The Death of Tecumseh," "Entrance of General Scott into Mexico," and "The Discovery of Gold."

BRUMMAGEM, a corruption of the name of Birmingham, the manufacturing town in England. Of the many ways of spelling the name of this city, the oldest is that given in *Domesday Book*—namely, Birmingeham. This was corrupted into Brummagem, a term which has become synonymous with worthless wares with a glittering outside, since various kinds of cheap sham ware, especially jewelry, are manufactured at Birmingham.

BRUMMELL, GEORGE BRYAN, 1778-1840 (better known as "Beau" Brummell); a man of wealth and fashion, who became an intimate companion of the prince of Wales, and was looked upon by the society of his day as the "glass of fashion and the mold of form." He was the arbiter in all matters of fashion, and was considered the very top of perfection in taste, especially in dress. As long as his fortune lasted or the prince of Wales would contribute, he kept up an elegant bachelor-establishment in London; but finally he lost the favor of his royal friend, became poor, gambled recklessly, fled from his creditors, and died in France in a hospital for mendicants.

BRUNCK, RICHARD FRANÇOIS PHILIPPE, one of the most ingenious critics and philologists of modern times, was born at Strasburg, Dec. 30, 1729. He was educated under the Jesuits in Paris; but abandoned his studies, and for some time was engaged as a military commissary during the seven years' war. A professor in Giessen, with whom B. happened to lodge while the army was in winter quarters, revived in him the love of classical studies. Returning to Strasburg, he devoted all his spare time to Greek, and soon distinguished himself as an able but adventurous critic and emendator. His belief that all inaccuracies in ancient Greek writings were introduced by copyists, often led B. astray; but, since the revival of learning, few critics have done more for the progress of Greek literature. His first work, *Analecta Veterum Poëtarum Græcorum* (1772-76), was followed by several editions of Anacreon (1778-86), and

editions of Apollonius Rhodius (1780) and Aristophanes (1781-83), *Poëta Gnomici* (1784), Virgil (1785), and Sophocles (1786-89). The last of these established a new era in the criticism of the tragic writers. The outbreak of the French revolution interrupted B.'s studies. He ardently attached himself to the popular side. During the reign of terror, he was imprisoned, but was liberated after the downfall of Robespierre. His means, however, had been so much reduced that he was compelled to sell his valuable library. From this time, 1801, he turned his attention from Greek to Latin literature, and published editions of Plautus and Terence. He died June 12, 1803.

BRUNDUSIUM. See BRINDISI.

BRUNE, GUILLAUME MARIE ANNE, a French marshal of the first empire, was b. at Brives-la-Gaillarde, 13th Mar., 1763. His education brought him at an early period into connection with the men of the revolution. Along with Danton, he helped to establish the Cordeliers' club. After the conquest of Belgium, he was sent as civil commissary to that country, but his warlike aspirations soon induced him to enter the military service. In 1797, he became brigadier under Napoleon in the army of Italy, and distinguished himself at Arcola and Rivoli, where he was made gen. of division and leader of the advance-guard. Sent by the directory to Switzerland in 1798, he executed his orders with brilliant success. In 1799, he was appointed to the command of the army of Holland, where he achieved the reputation of being one of the best generals of his age. He vanquished the Anglo-Russians at Bergen on the 19th of Sept., 1799, and on the 19th of Oct., forced the duke of York, commander-in-chief of the combined armies, to capitulate at Alkmaar, under humiliating circumstances. In 1803, he was named ambassador to the Ottoman porte, and was received by Selim III. with great distinction. In 1804, he obtained the dignity of marshal, and in 1805 returned to France. Two years afterwards, B. became governor-general of the Hanseatic towns, and was charged with the conquest of Pomerania; but circumstances having occurred which unnecessarily excited the distrust of Napoleon, he was recalled, and his future services dispensed with. After the fall of the emperor, he declared for the Bourbons, but his offers were rejected, and in consequence he joined Napoleon after his return from Elba. He was now made a peer, but the battle of Waterloo completely destroyed his prospects. He again made his submission, but was barbarously assassinated at Avignon, 2d Aug., 1815, by the populace, who were infuriated against him on account of certain crimes laid to his charge, of which, however, he seems to have been entirely guiltless.

BRUNEHAUT, or **BRUNEHILDE**, 534-613; daughter of Athanagild, king of the Visigoths and wife of Sigebert, king of Austrasia. Her sister Galsunda, the wife of Chilperic, king of Neustria and the brother of Sigebert, had been abandoned and murdered by Chilperic at the demand of his mistress, Fredegonda, who became queen. Brunehaut induced her husband (Sigebert) to invade Neustria, where, while besieging Tournay, he was slain by emissaries of Fredegonda, and Brunehaut was taken prisoner by Chilperic. At Rouen she persuaded one of Chilperic's sons to marry her, and, with the help of the bishop of the place, she escaped to Austrasia, which was then ruled by Chilperic; but she recovered her authority. After the death of Childebert she provoked war between her grandsons, heirs to the throne, in which one was killed, and she was about to take the throne when a son of Fredegonda, Clothaire II., interposed and captured her easily, as her army refused to fight. She was for three days exposed to torture and insult, and then tied to the tail of a wild horse and dragged to death, after which the body was burned and the ashes scattered to the air.

BRUNEL, ISAMBARD KINGDOM, an eminent engineer, son of Sir Mark Isambard B., b. at Portsmouth, England, in 1806, was educated at the college of Henri Quatre, Caen, in France. He commenced practical engineering in 1826, under his father at the Thames tunnel, and in the progress of that great work was often exposed to danger from the water breaking in and flooding the excavations, having more than once to save his life by swimming. He assisted in his father's experiments for making carbonic acid gas a motive power, and was designer and civil engineer of the *Great Western*, the first steamship built to cross the Atlantic; and of the *Great Britain*, the first ocean screw-steamer. The *Great Eastern*, the largest vessel ever built in the world, was erected under his sole direction. In 1833, B. was appointed chief engineer to the Great Western railway, and designed and constructed the whole of the tunnels, bridges, viaducts, and arches on this line, and extension branches. Among other docks at English seaports, in the improvement and construction of which he was engaged, may be mentioned the Bute docks at Cardiff, and the old North dock at Sunderland. In 1842, he was employed by government to construct the Hungerford suspension-bridge across the Thames at Charing Cross, London. In 1850-53, he constructed the works of the Tuscan portion of the Sardinian railway. He died suddenly, Sept. 14, 1859.

BRUNEL, SIR MARK ISAMBARD, the celebrated engineer of the Thames tunnel, son of an agriculturist, was born at Haqueville, near Rouen, in France, April 25, 1769. He early showed an inclination for mechanics, and at school preferred the study of the exact sciences to the classics. His most remarkable undertaking was the Thames tunnel,

formed beneath the bed of the river, and which, commenced in Mar., 1825, was opened to the public in Mar., 1843. Assisted by his son, the subject of the previous article, he for ten years pursued a course of experiments for employing carbonic acid gas as a motive-power, but the cost of the machinery prevented its introduction as a substitute for steam. Among the less important of B.'s inventions, were machines for making wooden boxes; for ruling paper; for shuffling a pack of cards without using the hands; for the manufacture of nails; and for making seamless shoes for the army—the latter, tried for two years, was abandoned from economical motives. Elected a fellow of the royal society in 1814, he was appointed vice-president in 1832. He was knighted in 1841; and died, Dec. 12, 1849.

BRUNELLESCHI, FILIPPO, one of the greatest Italian architects, was b. at Florence, in 1377. He first learned the art of a goldsmith; next, that of a sculptor; and finally, devoted himself to architecture. He also studied zealously both mechanical and mathematical science, and is reckoned the first who established, on a sound basis, the theory of perspective. When still a young man, B. went to Rome, where he acquired a profound knowledge of ancient architecture, the result of which was that two ideas completely possessed his mind: the one was to revive the ancient style of architecture; the other was, to make himself master of the mechanical knowledge of the ancient architects. In 1407, he returned to Florence. In 1420, it was proposed to complete the structure of the cathedral of Santa Maria del Fiore, founded in 1296, and then only wanting a dome. A great assembly of architects from all quarters was convened to determine how it might be practicable to cover the vast octangular area. While the debate was going on, B. was earnestly elaborating his own designs; but when he first came forward and proposed his plan, it was so ill received, on account of its supposed absurdity, that B. was "lifted off his legs, and carried out of the room." He, however, obstinately persisted in explaining his scheme, and at last succeeded in convincing every one of its feasibility. The work was intrusted to him, and finished, with the exception of the lantern, with which he intended to crown the whole, but was prevented by his death in 1446. B.'s dome, measured diametrically, is the largest in the world, and served as a model to Michael Angelo for that of St. Peter's. Besides this *chef d'œuvre*, B. executed several other great works, such as the churches of San Spirito and San Lorenzo, as well as the designs for the Pitti palace, which originated the beautiful style of Tuscan palace-architecture in the 15th century.

BRUNETIÈRE, FERDINAND, editor, b. in Toulon, France, in 1849; engaged in critical literature in 1870; became professor of the French language and literature at the Superior Normal School of Paris in 1886; member of the Legion of Honor in 1887; and in 1893 was appointed lecturer at the Sorbonne, elected to the French academy, and succeeded M. Buloz as editor-in-chief of the *Revue des Deux Mondes*. In 1897 he visited the United States and lectured before the students of Johns Hopkins and Columbia universities.

BRUNI, the name of an island to the s.e. of Tasmania, lying between Storm Bay and d'Entrecasteaux channel. The island is long and irregular in shape, being divided by a narrow isthmus into North and South Bruni island. The latter has a revolving light 335 feet from the sea level.

BRUNI, LEONARDO, a native of Arezzo, and hence styled *Aretino*, was b. in 1369. He merits notice as one of the most learned men who flourished during the epoch of the revival of Greek learning in Italy. He first studied law at Florence and Ravenna, but afterwards turned his attention to classical literature. He then went to Rome, where he filled several offices at the papal court. In 1414 he attended John XXII. to the council of Constance. On the deposition of that pope, he returned to Florence, where he was of service to the republic in several important matters. His *Historia Florentina* procured for him the rights of citizenship, and at a later period, through the favor of of the Medicean family, he was appointed state-secretary. He died 9th Mar., 1444. Florence and Arezzo vied with each other in the splendor with which they celebrated his obsequies. B. aided in advancing the study of Greek literature mainly by his literal translations into Latin of Aristotle, Demosthenes, Plutarch, and others. Of his original works, which are very numerous, we may mention *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476); *De Origine Urbis Mantuæ*; *De Romæ Origine*; *Epistolæ Familiæres*; and *Vite di Dante e del Petrarca*.

BRÜNN, a fortified city of the Austrian empire, capital of the government of Moravia, is beautifully situated, partly on the slope of a hill, and partly in a pleasant valley, at the confluence of the Schwarzawa and the Zwittawa, in lat. 49° 12' n., and long. 16° 37' east. Behind the city, on an eminence, is situated the castle of Spielberg, formerly the citadel, but now used as a state-prison, and noteworthy as the place in which Silvio Pellico was confined from 1822–30. Among the most interesting buildings of B. are the cathedral of St. Peter; St. James's church, a Gothic edifice, with a tower 276 ft. in height, and a valuable collection of ancient printed books; the church of the Minorites; and the Augustine convent. There are also several fine palatial residences belonging to the old

nobility. B. is one of the most important manufacturing towns in the Austrian dominions. Its woollens are specially celebrated, and it has a variety of other manufactures. The Rossitz coal mines are in the vicinity. Pop. in 1890, 95,342. Napoleon made B. his headquarters before the battle of Austerlitz.

BRUNNEN, a village of Switzerland, in the canton of Schwyz, of which it forms the port, near the mouth of the Muotta, in the lake of Lucerne. It is beautifully situated at the south-eastern bend of the lake, and is celebrated in history as the place where, in Dec., 1315, the deputies of the forest cantons, who, eight years before, had formed a plan for the liberation of their country from the Austrian yoke, laid the basis of the Helvetic republic.

BRUNNER, OR **BRUNN**, JOHANN CONRAD, 1653-1727; a German anatomist, professor in the university of Heidelberg, and physician to the elector palatine. He made many anatomical investigations, particularly in the pancreas, the small intestines, and the duodenum. His name lives in the *Brunner's Glands*.

BRUNNER, SEBASTIAN, b. 1814; chaplain of the university of Vienna, where he studied theology. In 1848, he established the *Vienna Church Gazette*. Soon after, he published, under the name *Nebelfungen-Lied*, a satire upon Hegel's doctrines. His entire works have been collected in 20 vols. Among them is a sharp criticism of Renan's *Life of Christ*. In all his writings he is of the ultramontane Roman Catholic school.

BRUNNOW, Count, ERNEST PHIL. VON, a Russian diplomatist, was b. at Dresden, 1797, and studied at the university of Leipsic. At the time of the congress of Aix-la-Chapelle, he entered the Russian service, and the ministers Nesselrode and Capo d'Istrias recognized at once his fitness for a diplomatic career. Among other posts, he attended the congresses of Troppau and Laybach, acted one year as secretary to the embassy in London, went to the congress of Verona, and then occupied for a time a high office in St. Petersburg. He was present, in a civil capacity, in the campaigns of 1828 and 1829 against the Turks. In the autumn of 1839, he was sent on a special mission to London, to take advantage of the unpleasant feeling between Great Britain and France for drawing the cabinets of St. Petersburg and London closer together, and in the following spring was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the war in 1854, he represented Russia in Frankfurt, and, along with count Orloff, was sent to the conference of Paris, Feb., 1856. Immediately after the treaty of peace had been concluded, he was sent on a special mission to London, to re-establish friendly relations between the courts of St. Petersburg and St. James's. He was afterwards appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he was a great favorite. He represented Russia at the conferences in London in 1864 and 1871. In recognition of his services, he was raised by the emperor of Russia to the rank of count in April, 1871. In 1874, he retired to Darmstadt, where he died in the following year.

BRUNO, SAINT, the founder of the Carthusian order of monks, was b. at Cologne 1051, and received his earliest education in the school attached to the collegiate church of St. Cunibert. Subsequently, he studied at Rheims, where he distinguished himself so greatly, that bishop Gervasius appointed him director of all the schools in his diocese. B., however, soon began to be troubled by the wickedness of his time, and, anxious to escape from what seemed to him the general pollution, he took refuge, along with six pious friends, in a desert place near Chartreuse, in the diocese of Grenoble. Here, in 1086, he founded one of the most austere of all the monkish orders, which received its name from the locality whence it had sprung. See **CARTHUSIANS**. B. and his companions had each a separate cell, in which they practiced the severities of the rule of St. Benedict, keeping silence during six days of the week, and only seeing one another on Sundays. Pope Urban II., who was one of B.'s most eminent scholars, in 1089 summoned the saint to Rome. B. obeyed the call reluctantly, and steadily refused all offers of preferment. In 1094, he established a second Carthusian monastery, called La Torre, in a solitary district of Calabria, where he died in 1101. He was not canonized until 1628. B. left no written regulations for his followers. These first made their appearance in a complete form in 1581, and were enjoined on all Carthusians by Innocent IX.

BRUNO, THE GREAT, Archbishop of Cologne, and Duke of Lorraine, one of the most eminent men of his time, was b. about 928 A.D. He was the third son of Henry the Fowler, and the brother of Otto I., emperor of Germany. Baldrich, bishop of Utrecht, and afterwards Israel Scottigena, and others, were his tutors. His surprising knowledge, sagacity, and eloquence secured for him an immense influence over the bishops and clergy, while, on the other hand, his liberality, meekness, and great earnestness of heart won the affections and reverence of the laity. Summoned by Otto to the imperial palace, he quickly assumed an influential position among the chroniclers, poets, and philosophers of the court. At a later period he was appointed archbishop of Cologne, and lord high chancellor of the empire. He accompanied Otto to Italy in 951, and honorably distinguished himself by his fidelity to his brother, when Otto's own son, Conrad, and others of his kindred rebelled against him. As a reward, the emperor appointed

him duke of Lorraine. B. died at Rheims, 11th Oct., 965. He wrote a commentary on the Pentateuch, and several lives of saints.

BRUNO, GIORDANO, the precursor of the school of modern pantheistic philosophers, was born at Nola, in the kingdom of Naples, about the middle of the 16th century. He entered, at an early age, the order of the Dominicans, but soon began to express his doubts in regard to the doctrines of transubstantiation and of the immaculate conception, in consequence of which he was obliged to flee from his convent. Henceforth, his life was unsettled. In 1580, he went to Geneva, where he spent two years, but having excited the suspicion and dislike of the strict Calvinists of that city by his general skepticism, he judged it prudent to betake himself to Paris, where he delivered prelections on the "great art" (logic) of Raymond Lully. His disputes with the bigoted Aristotelians of the university of Paris compelled him, however, to leave France. He passed over into England, where he resided for two years in comparative quiet, enjoying the friendship of sir Philip Sidney and the protection of the French ambassador, Michel de Châteaufort de la Mauvissière. Here he composed his most important works, but at last, having incurred the displeasure of the clergy by his vehement denunciation of the Aristotelian philosophy, and other grave heresies, he returned to Paris in 1585. In 1586, he proceeded to the university of Marburg, where he matriculated; and to Wittenberg, where he became professor; but being asked to join the Lutheran communion, he refused. On his departure from the city, he pronounced an impassioned panegyric on Luther. After spending some time in Prague, Brunswick, Helmstadt, and Frankfort-on-the-Main, he resolved to go back to Italy. He fixed his residence at Padua; but after a stay of two years, he went to Venice, where he was arrested by the officers of the inquisition, and conveyed to Rome in 1593. He was now subjected for two years to persecution, in the vain hope that he would recant; but when all the endeavors of his enemies proved ineffectual, he was brought to the stake on the 17th Feb., 1600, and burned as an obstinate heretic. On this spot a statue was erected in 1889.

B.'s writings, of which the most valuable are composed in Italian, display throughout a strong, courageous, excitable soul, susceptible of deep enthusiasm, but vainly laboring to attain perspicacity. The *Cena delle Ceneri*, or evening conversations on Ash-Wednesday, is an apology for the Copernican astronomy; the *Spaccio della Bestia Trionfante*, or expulsion of the triumphant beast (Par. 1584), is a satirical but somewhat heavy allegory in the style of the times. His greatest works are metaphysical, such as the *Della Causa Principio ed Uno* (On the One Sole Cause of Things) and the *Del Infinito Universo e Mondi* (On the Infinity of the Universe and of Worlds). The doctrine enunciated in these is pantheistic. B. held that the infinite soul of God did not merely inhabit or pervade the universe, but that the universe was simply a manifestation of him, and therefore itself divine. God was therefore, in the most literal and physical sense, all in all. B.'s philosophy, in later times, was quite unappreciated, and even neglected, until Jacobi drew public attention to it in his *Letters on the Doctrine of Spinoza*. Both Spinoza and Descartes were much indebted to Bruno. Original editions of B.'s works are very rare. Those in Italian were published by Wagner in 1830: some Latin ones by Gfrörer in 1836. See Bartholomés's *Bruno* (1846); Frith's *Life of Bruno* (1887).

BRUNONIAN SYSTEM OF MEDICINE. See BROWN, JOHN.

BRUNSWICK, a co. in s.e. North Carolina, on the ocean and cape Fear and Waccamaw rivers; 890 sq. m.; pop. '90, 10,900. Co. seat, Southport.

BRUNSWICK, a co. in s.e. Virginia, on North Carolina, watered by the Roanoke and Nottaway rivers; 600 sq. m.; pop. '90, 17,245. Co. seat, Lawrenceville.

BRUNSWICK, a city and port of entry in Glynn co., Ga., on St. Simon's Sound, and the Plant System and the Southern railroads; 8 miles from the ocean, 80 miles s.w. of Savannah. It is more than a century old, but has attained its present importance since 1870. It has a spacious harbor with a lighthouse; exports cotton, phosphates, tar, rosin, turpentine, and pine lumber; is connected by steamers with New York, Fernandina, and Savannah; has churches, banking facilities, Glynn co. academy, and daily and weekly newspapers; and is supplied with water from artesian wells. Pop. '90, 8459.

BRUNSWICK, a town in Cumberland co., Me.; on the Androscoggin river and the Maine Central railroad; 8 miles w. of Bath, and opposite Topsham, with which it is connected by a bridge. It is at the head of navigation; is principally engaged in the lumber trade and in cotton manufacturing; and contains Bowdoin College (q.v.), the Maine State Medical School, several national and savings banks, an insurance company, board of trade, high school, public library, and weekly newspapers. It was settled in 1628. Pop. '90, 6012.

BRUNSWICK, DUCHY OF (Ger. *Braunschweig*), a state of northern Germany, consisting of three larger and five smaller distinct parts, and lying mostly within lat. 51° 38' to 52° 28' n., and long. 9° 23' to 11° 30' east. Its entire area amounts to 1424 square miles. Pop. in 1895, 494,213. For administrative purposes, B. is divided into six circles—viz., Brunswick, Wolfenbüttel, Helmstedt, Gandersheim, Holzminden, and Blankenburg. Of the three larger parts, the principal one, forming the circle of Wolfenbüttel, and including the capital, lies between Prussia and Hanover; the second, extending e. and w. from Prussia to the Weser, divides Hanover into two parts; and the third, forming the circle

of Blankenburg, lies to the s.e. between Hanover, Anhalt, and Prussia. The smaller parts are the isolated bailiwicks of Calvörde in the e., Thedinghausen in the w. (not far from Bremen), and some very small demesnes in the Hanoverian boundaries. B. belongs mostly to the basin of the Weser, which serves as a boundary on the west. The surface is mostly mountainous, particularly in the southern portions of the country, but B. has nevertheless level tracts of considerable extent. The rivers, with the exception of the Weser, are comparatively unimportant, though advantage is taken of one or two for the transport of timber. The climate in the low lands resembles the general climate of northern Germany; but in the Harz district it is so much colder, that harvest is generally a month later than in the plains.

The mines and quarries of B. produce marble, alabaster, limestone, gypsum, alum, iron, copper, lead, sulphur, and salt in large quantities, with some portions of gold and silver. Agriculture, which is carried on with intelligence and energy, constitutes the chief wealth of the duchy. The products include, beside the ordinary cereals, large quantities of leguminous plants, potatoes, tobacco, and beet-root. The pasture-land is extensive, and great attention is paid to the rearing of cattle, and especially to the breeding of sheep, wool being an important article of commerce. A large number of persons are employed in the cutting and preparation of timber. The chief manufactures of B. are of linen, stockings, woolen cloth, metals, porcelain, paper, sugar, glass, beer, etc.

The inhabitants are mostly Saxons, and nearly all Lutherans (16,419 Catholics in 1890). The people in the rural districts speak a broad low-German dialect. The government is a limited monarchy. As a state of the German empire, Brunswick has two votes in the Bundesrath (confederate council), and sends three deputies to the Reichstag. The budget is voted for a period of two years. The revenue for 1896-7 was given at 12,930,000 marks, the expenditure at 13,726,900. The public debt in 1895 amounted to 28,396,288 marks, four-fifths of it contracted for the establishment of railroads.

B. was included, as a part of Saxony, under the empire of Charlemagne. In 1235, B., with Lüneburg, was made a duchy under Otto, who died in 1252, and was succeeded, in 1267, by his son Albrecht, founder of the older line of Wolfenbüttel. John, another son of Otto, was the founder of the older Lüneburg line, which became extinct with William of Lüneburg in 1369. In 1569, Henry, who styled himself duke of Brunswick-Lüneburg-Dannenberg, founded the new house of Brunswick-Wolfenbüttel; and his brother William founded the new line of Brunswick-Lüneburg, which, in 1815, became the kingdom of Hanover. At the death of the childless duke William in 1884, the succession passed to the duke of Cumberland, son of George V. the dethroned king of Hanover, but as he refused to recognize the new constitution of the German empire, the imperial government declined to allow the succession to take place and an interregnum occurred. In October, 1885, Prince Albrecht, a nephew of the emperor, was elected regent of the duchy by the diet.

BRUNSWICK, the capital of the duchy of Brunswick, is situated on the Oker, in a level and fertile district, in lat. 52° 46' n., and long. 10° 4' east. B., which is a very old place, is supposed to have been first walled about the 9th c., by Bruno, duke of Ostfalen. But Henry the Lion, in the 12th c., so greatly beautified and extended the city that he may be almost said to be its founder. In the 13th c., B. became a member of the Hanse league, and soon attained considerable commercial prosperity, but its importance declined with the decay of the league. The town is most irregularly built, with narrow and crooked streets, but possesses the advantages of good causeways and an abundant supply of water. The cathedral—in which are preserved some interesting relics brought by Henry the lion from the Holy Land—with the churches of St. Martin, St. Catharine, and St. Andrew, with its steeple 316 ft. high, are among the principal buildings. In the museum are some interesting antiquities and works of art by Jan Steens, Albert Dürer, Holbein, Rembrandt, Raphael, Guido, Ruysdael, Michael Angelo, and Benvenuto Cellini. The industry of B. consists chiefly in manufactures of woolen and linen, chicory, beet-sugar, tobacco, *papier-mâché*, lackered wares, etc. Its great annual fair, founded in 1498, is important. The old fortifications of B. have been demolished, and their site converted into pleasant promenades. A fine avenue of linden-trees leads to the duke's palace, an imposing edifice, built in 1869. Pop. 1895, 115,138.

BRUNSWICK, HOUSE OF. Henry the Lion, who held the united duchies of Bavaria and Saxony in the 12th c., may properly be called the immediate ancestor of this house, though they can trace their lineage back to Albert Azo I., margrave of Este in Italy, who died in 964. The eldest son of Henry the Lion became count palatine by marriage; his second son, Otho, died in 1218 after having been crowned German emperor, and it was therefore William, a younger son, who succeeded to the Brunswick inheritance. Otho, a grandson of Henry the Lion, was invested in 1235 with these domains as a fief of the empire and recognized as the first duke of Brunswick. Ernest the Pious, or the Confessor, who died in 1546, inherited the principalities of Brunswick-Lüneburg, and was the founder of both branches of the existing dynasty; he took an active part in the reformation and signed the confession of Augsburg. His descendant, Ernest Augustus, duke of Brunswick-Lüneburg, was raised to the dignity of ninth elector of the empire in

1692, by his marriage with Sophia, a grand-daughter of James I. of England. His son George Lewis succeeded to the crown of Great Britain in 1714. Ferdinand, a later duke of this house, entered the Prussian service in 1740, distinguished himself in the seven years' war, decided the battle of Prague, and gained the victories of Corfeld and Mindon. The ducal residence, which had been at Wolfenbützel, was in 1754 removed to Brunswick by duke Charles; he founded the famous Collegium Carolinum, and was a faithful ally of England during the seven years' war. He died 1780. His successor, Charles William Ferdinand, was a nephew of Frederick the great, and married Augusta, daughter of George III. of England. He fought in the seven years' war, and played an important part at the battle of Krefeld in 1758. In 1792 he was commander-in-chief of the allied armies of Austria and Prussia against France. He marched into Champagne, but was compelled to conclude an armistice with Dumouriez after trying in vain to force the position of Valmy. In 1806 he was called to lead the Prussian troops against Napoleon, who defeated him at Jena and Auerstadt; he retired broken-hearted, and died soon afterwards from the effects of his wounds. Napoleon incorporated his duchy with the new kingdom of Westphalia, but after the battle of Leipzig it was restored to his son Frederick William, who had distinguished himself in the campaigns of 1792, 1793, 1806, and who fell at the head of his troops at the battle of Quatre-Bras in 1815. His son Charles Frederick was a minor, and up to 1823 George IV. of England acted as prince-regent. The people of B. endured the misrule of Charles Frederick for seven years; then they revolted and drove him out of his duchy in 1830. He died childless at Geneva in 1873. By an act of the Germanic diet the duchy was transferred to his brother William, prince of Oels (b. 1806), who assumed the government, April 25, 1831. He d. childless, 1884, and the succession passed to the duke of Cumberland, son of George V., the dethroned king of Hanover. As the heir refused to recognize the new constitution of the German government, his claim was rejected, and the nephew of emperor William, prince Albert of Prussia, was elected regent.

BRUNSWICK BLACK is a varnish employed for coating over coarsely finished iron grates, fenders, etc. It is mainly compounded of lamp-black and turpentine, and when applied with a brush, quickly dries, and leaves a shining jet-black surface.

BRUNSWICK GREEN is a pigment used in the arts, and consisting of the hydrated chloride and oxide of copper, CuCl_2 , $3\text{CuO} \cdot 4\text{H}_2\text{O}$. It may be prepared (1) by acting upon metallic copper with common salt and diluted sulphuric acid, (2) by acting upon metallic copper with moistened sal-ammoniac, or (3) by mixing sulphate of copper and common salt into a paste with water. It is found native at Atacama, in Chili, in the form of a green sand, hence the name atacamite (q.v.).

BRUSA, or **BURSA**. See **BROUSSA**.

BRUSASOR/CI, or **DOMENICO RICCIO**, 1494-1567; an Italian painter noted for his close imitation of Titian. He worked chiefly in fresco, and on mythological themes. The "Coronation of Charles V.," the "Procession," "Phaethon," and the "Martyrdom of St. Barbara," are among his more important achievements.

BRUSH, **CHARLES FRANCIS**, electrician; b. in Euclid, O., March 17, 1849; graduated at the university of Michigan in 1869; appointed a chevalier of the Legion of Honor in 1881; inventor of a dynamo for electric lighting, a lamp for use on a large electric circuit, and of many devices for the perfection of electric lighting.

BRUSH, **GEORGE JARVIS**, b. New York, 1831; educated at Yale, and at Munich, and the Freiberg mining academy; chief of the Sheffield scientific school (of Yale), and professor of mineralogy and metallurgy in Yale college. He has written upon various scientific subjects in the *American Journal of Science*, and assisted in editing Dana's *Mineralogy*.

BRUSHES AND BROOMS, implements of vegetable fiber or hair of very early use, mentioned by Homer. Brushes with single tufts, such as are used by artists, are made of the but one tuft, and are such as hair pencils and painters' brushes. The compound have more than a single tuft. Where they are placed side by side on flat boards they are called stock brushes. Those with single tufts, such as are used by artists, are made of the hair of the camel, goat, badger, and of hog's bristles. The hairs for pencils are arranged so as to form a point in the center, and are fixed in a quill or other small tube. Compound brushes are of set or pan work, and of drawn work. The ordinary house broom is an example of pan work, into the stock of which holes are bored of the size desired. The bristles, hairs, or fibers needed to fill each hole are collected, the thick ends dipped into molten cement, usually pitch, bound with thread, dipped again, and with a quick twist set into the hole. In drawn brushes, those intended for shoes, teeth, nails, etc., and clothes, the holes are more carefully bored, and have smaller ones at the top communicating with the back of the brush, through which a loop of wire passes from the back of the stock. Half the number of hairs or fibers needed to fill the holes are passed around the wire, which is then smartly drawn up so as to double the hairs and force them as far as possible into the hole. The outside ends are made even with trimming, and the backs of the brushes are covered with veneer to conceal the wire-work. Bristles are imported from Poland, Russia, and other countries. In 1808, the manufacture of brushes from the fibers of whalebone, and in 1810, from twigs of broom, rushes, and other plants, was patented. In 1842, split quills were added, and in 1872, horn and other substances. The great staple in the United States is broom-corn, a considerable amount being raised in the state of New York, and manufactured by the Shakers. Revolving

brushes were patented in 1811; and in 1862, revolving hair brushes, for the use of barbers, were introduced, but they have never become popular. As long ago as 1699, there was invented "a new engine for sweeping the streets of London, or of any city or town." But nothing of the kind was put in use until 1825, when revolving brooms were used. A great many improvements followed, and at the present time street-sweeping by such machines is common in large cities. The most important recent invention in brush-making is of American origin, the Woodbury machine for bunching, wiring, and inserting bristles in the stock. In this machine a metal comb of uniform thickness is filled with bristles, holding them by the middle, so that one half of the bristles appear above the surface of the comb, and the other half underneath. The comb thus charged moves in guide-ways, and discharges bristles from each division successively into a channel in which they are brought into a horizontal position and a proper quantity taken up to form a tuft. This tuft is moved along an incline against the end of a cylinder, when a plunger doubles the bristles into a loop, which is seized by wire, and in an instant securely fastened.

BRUSH TURKEY, the native name of an Australian bird of the megapodidae family, of which a dozen species are known; called also the New Holland vulture, jungle fowl, and native pheasant. It is the only wild fowl known that is gregarious in the duty of hatching. Before the time for laying eggs, several pairs of these birds unite in building an enormous pyramidal heap of vegetable matter in part decayed. In this muck-heap of leaves, grass, and rotting wood the females deposit their eggs, which are placed about a foot from each other and covered 2 ft. deep. The hatching is done by the heat of the decaying matter, and the young appear full feathered and able to take care of themselves from the first. Nests have been found that contained a bushel of eggs. Some species of the brush turkey place their eggs in sand, some construct huge mounds of earth, and some make excavations on the sea-shore. In size and general appearance it much resembles the common domestic turkey.

BRUSSELS (Fr. *Bruxelles*), the capital of Belgium, is situated on the small river Senne, a tributary of the Dyle, in lat. 50° 51' n., and long. 4° 21' east. It communicates with Antwerp and the Baltic sea, by means of the Scheldt canal, and railways connect it with Germany, France, and Holland, as well as with all the principal towns of Belgium. The city is built partly on the side of a hill, and partly on a fertile plain; and though some of the streets are so steep that they can be ascended only by means of stairs, B., on the whole, may be pronounced one of the finest cities in Europe. The upper town, situated on the side of the hill, is the newest and most fashionable, and is the residence chiefly of the great and wealthy. The king's palace, public offices, chief hotels, and mansions of foreign ministers are here. It is also much more healthy than the lower town, which, stretching along the canal and the Senne, is greatly subject to fogs. But the latter, with its numerous handsome old buildings, formerly belonging to the Brabant nobility, but now occupied by merchants and traders, has a fine picturesque appearance, while some of its public edifices are unrivaled as specimens of Gothic architecture. This part has also several noble churches, but it is now wholly given over to trade. French is spoken in the upper part of B.; but in the lower, Flemish is prevalent, and in one quarter the Walloon dialect is spoken. The English language, owing to the large number of English who reside in B. for economy, is also very common. The walls which formerly surrounded B. have been removed, and their place is now occupied by pleasant boulevards, shaded by alleys of trees, extending several miles. The *Allée Verte*—a double avenue along the Scheldt canal—forms a splendid promenade, and leads towards the palace of *Laeken*, the suburban residence of the royal family, 3 m. n. of the city. Besides the fine park in the upper town, covering an area of some 17 acres, ornamented with fountains and statues, and surrounded by the king's palace, the "palace of the prince of Orange," the chamber of representatives, and other buildings, B. has several other squares or places, among which the most noteworthy are—the *Place Royale*, with its colossal monument of Godfrey of Bouillon; the *Grande Place*, in which is situated the Hôtel de Ville, a splendid Gothic structure, erected in the beginning of the 15th c., with a pyramidal tower 364 ft. high, surmounted by a statue of St. Michael, the patron saint of B., and where, in 1568, the patriot counts, Egmont and Horn, were beheaded by order of the duke of Alba; and the *Place des Martyrs*, where a memorial has been erected to those who fell here in the revolution of 1830. Among the churches of B., the largest and finest is the cathedral of St. Gudule, which dates from the 12th c., and is built in the pointed Gothic style, with two towers of more modern date, rising on each side to a height of 264 ft., many richly painted windows, a pulpit, considered the masterpiece of Verbruggen, and monuments of the dukes of Brabant and other distinguished persons. In the *Palais des Beaux Arts* is the picture-gallery, containing the finest specimens of the Flemish school of painting; the public library, with a great number of old MSS., collected by the dukes of Burgundy—MSS. interesting and valuable not only for their contents, but for the beautiful miniature paintings with which the scholars of Van Eyck adorned them. The observatory is one of the finest in Europe. The educational establishments of B. are numerous, the principal being the free university, founded in 1834, with four faculties—viz., law, medicine, mathematical and physical sciences, and philosophy, and having a special school of

pharmacy attached. It has also numerous charitable and benevolent institutions; and is the seat of the provincial government of s. Brabant, as well as of the general government of the kingdom. B. is one of the chief centers of the industry of the country. Its lace is particularly famous. Of the esteemed carpets which pass under the name of B. carpets, only a few are manufactured here, most of those of Belgic make being produced at Tournai. It has also manufactures of damask, linen, ribbons, paper, jewelry, hats, soap, porcelain, mathematical and musical instruments, etc. Carriage-building is also an important branch of industry. Printing and lithographic establishments are numerous; and about a dozen newspapers, of which the *Indépendance Belge* has a European reputation, are published daily. Pop. in 1895, with suburbs, 518,387.

As early as the 8th c., we find B. (*Bruchsellia*), then probably a villa of the Frank kings, mentioned in old chronicles, and that a church existed here in 966 is proved by a deed of the emperor Otho I. Under Charles V., B. was made the court-residence in the Netherlands, and became afterwards, under Philip II., the chief arena of the revolution, and of the atrocities committed by the duke of Alba and the inquisition. B. suffered greatly in the war of Spain against Louis XIV.—in whose reign it was bombarded by marshal Villeroi, and upwards of 4000 buildings destroyed—and in that of Austria against Louis XV.; but still more from the continual prevalence of party animosities caused by the policy of Austria. Under the mild rule of Maria Theresa, B. flourished greatly, and in this time, many of its best institutions and public buildings were founded. In 1789 occurred the Brabant revolution under Joseph II., and scarcely had Austrian rule been re-established, after a brief time of independence, when B. fell into the hands of the French, 1792. After other changes of fortune, B., with the other parts of Belgium, was incorporated with the kingdom of the Netherlands in 1815, and so remained until the revolution of 1830, by which it became the capital of the independent kingdom of Belgium.

BRUSSELS CARPETS. See CARPETS.

BRUSSELS SPROUTS, one of the many cultivated varieties of *brassica oleracea* (see CABBAGE). It is distinguished by producing, in the axils of the leaves, little clusters of leaves which close together and form miniature cabbages. These are used, like other greens of this species, for the table, and are very delicate. The plant is cultivated much in the same way as cabbage or kale, requiring, however, less space than most of the varieties. It may be planted in shady situations, or between the rows of crops, such as pease, beans, scarlet-runners, etc., which are to be removed from the ground in autumn. The sprouts are fit for use chiefly in winter and spring. The stem sometimes attains a height of 4 ft., and the head resembles a small, imperfectly boiled savoy; but there is a subvariety with shorter stems, preferable for many situations. In some places, it is customary to remove the head early in winter, in order to promote the development of the lateral shoots in spring; but if the head is allowed to remain, the plant becomes taller, and new shoots are formed as the lower ones are removed. The seed is sown in Feb. or March. Seed is very generally exported from Belgium, as this vegetable is said to degenerate in Britain. Its use has of late rapidly extended, and none of the many varieties of the species to which it belongs is better deserving of cultivation.

BRUTTIUM, an ancient division of Italy, comprising the s. portion, now Calabria. The people known as Bruttians became rulers in the peninsula about 356 B.C. Before that period the people seem to have been of some Pelasgian races, but at an early date Greek adventurers started settlements on the coast, of which the more important were Crotona, Rhegium, and Locri. The warlike Greeks subjected the natives and held them in slavery until after the Peloponnesian war. At that period the Lucunians came in from the n. and still further oppressed the natives. At last, about the middle of the 4th c. B.C., the people rising against oppression became their own masters; they gained power rapidly, captured some of the Greek cities, and, assisted by the Lucanians, held their own against the Grecian arms. The B. were powerful until after their participation in the Samnite war against Rome, 282 B.C. Not long afterwards they were subjected to Rome and gave up much of their territory. In the second Punic war they revolted and assisted Hannibal, for which they were punished by Rome in the sacrifice of what little they had left of independence. At that time the Brutti as a nation disappeared from history.

BRUTUS, LUCIUS JUNIUS, figures in the legendary history of early Rome, as the hero who overturned the monarchical, and established the republican form of government. The legend runs that he was the son of a rich Roman. On his father's death, Tarquin the proud took possession of the property, and put an elder brother to death, and B. himself only escaped the same fate by feigning idiocy (hence the name *Brutus*, stupid). The oracle of Delphi foretold that he should govern in Rome. Remembering his own wrongs, and gifted with the strength and wisdom of one who was fulfilling the decrees of fate, B., when the foul rape committed by one of the royal family upon Lucretia had shocked the people, convoked them, placed himself at their head, and drove the kings from Rome. He is said to have been then elected one of the two first consuls (509 B.C.). That his character as a stern old Roman hero might be complete, the legend adds that he sacrificed to the new republic his own sons, detected in a conspiracy to restore the

monarchy; and that at last he fell in mortal combat repelling an attack led on by one of the sons of Tarquin. Little more, however, can be said to be established upon sufficient historical evidence with regard to B., than that there existed a person of that name who held high office in Rome at a very early period.

BRUTUS, MARCUS JUNIUS, b. 85 B.C., appears to have spent the early years of manhood in exclusive devotion to literary pursuits, and not to have taken part in the political dissensions agitating Rome till he had attained a mature age. When the civil war broke out between Pompey and Cæsar, he sided with the former; but after the battle of Pharsalia, made his submission to the latter, and, in the following year, was appointed governor of Cisalpine Gaul. On returning to Rome, he divorced his wife, in order to marry Portia, the daughter of Cato, of whose principles in politics he professed to be a disciple. The influence of Cassius prevailed upon him to join the conspiracy which ended in the murder of Cæsar. The efforts of B. to retain popular favor afterwards being unavailing to counteract the effects of the eloquence of Antony, he was forced to leave first Rome, and then Italy. The remainder of his life was spent partly in Athens, partly in Asia Minor, and partly as the leader of a marauding force which maintained itself by plundering the inhabitants of the eastern shores of the Adriatic. Defeated by Antony and Octavianus (Augustus) at Philippi (42 B.C.), he terminated his life by falling upon his sword.

BRÜX, a t. of Bohemia, situated on the Bila, about 14 m. n. of Saatz. In its vicinity are extensive coal-mines, and the famous mineral springs of Püllna and Seidlitz, from which the inhabitants of B. prepare a considerable quantity of salts. Pop. of commune, '90, 14,894.

BRUYÈRE, JEAN LA. See LABRUYÈRE.

BRUYS, or **BRUIS**, PETER DE, a priest of southern France supposed to have been one of Abelard's pupils, founder of a sect by the name of Petrobrussians. He opposed the church as it was, seeking to restore the Christian religion to its original simplicity and freedom from symbols, denied the authority of any established hierarchy and the necessity of any priestly ministration, opposed infant baptism and the communion, and held that, as prayer could be offered anywhere, churches were useless. His followers destroyed images, burnt crosses, and maltreated priests. After many years of non-molestation B. was burnt at the stake at St. Gilles about 1126. The sect existed for a long time under the name of Henricians, from Henry of Lausanne, one of their leaders.

BRYAN, a co. of e. Georgia, on the sea-coast; 400 sq. m.; pop. '90, 5520, incl. colored. The soil is level and mostly of sand, and in a large degree covered with pine forests. The Savannah, Florida, and Western railroad passes through the county. Productions, rice, corn, cotton, etc. Co. seat, Clyde.

BRYAN, MICHAEL, 1757-1821; an English art critic and connoisseur, author of a *Dictionary of Painters and Engravers*, a recognized standard work. In 1794, he was employed by several English noblemen to purchase the Orleans gallery of paintings.

BRYAN, WILLIAM JENNINGS, politician; b. in Salem, Ill., March 19, 1860; educated at Illinois college and the Union college of law at Chicago; removed to Lincoln, Neb., in 1887; elected to congress in 1890 and 1892; became editor of *The World-Herald* in 1894; and was the unsuccessful candidate of the Democratic and Populist parties for president of the United States, in 1896, receiving 176 electoral votes.

BRYANT, JACOB, an eminent English scholar, was b. at Plymouth in 1715. He was educated at Eton and King's college, Cambridge, where he took his degree of M.A. in 1744. In 1756 he became private secretary to the duke of Marlborough, and accompanied his grace to the continent. Substantial proofs of the duke's esteem raised him above the region of pecuniary cares, and enabled him to devote his whole life to letters. He d. 14th Nov., 1804. Among his numerous publications may be mentioned: *Observations and Inquiries relating to various Parts of Ancient History* (Cambridge, 1767); *A New System or Analysis of Ancient Mythology* (1774-76); *Vindicia Flavianæ* (a defense of Josephus's testimony in regard to Christ), (1780); *Treatise on the Authenticity of the Scriptures and the Truth of the Christian Religion* (1792); *A Dissertation concerning the War of Troy*, etc. (1796); *The Sentiments of Philo-Judeus concerning the Logos* (1797); and a variety of dissertations on the difficult passages of Scripture (1803).

BRYANT, WILLIAM CULLEN, a distinguished American poet and journalist, was born in Cummington, a mountain town of Hampshire co., Mass., Nov. 3, 1794, and on both sides of his house was descended from old families of Plymouth co. His father, Peter Bryant, a physician of more than ordinary culture, who took great pains to educate his children, encouraged William in his attempts to compose, urging him to imitate Pope, and when ten years of age the boy contributed a poem relating to school-life to a county newspaper. In 1807 he acquired wider fame, friends having published in Boston *The Embargo*, or *Sketches of the Times*; a *Satire by a Youth of Thirteen*. In 1809 a second and enlarged edition appeared, including *The Spanish Revolution*, and a preface assuring the incredulous public that the author was really a youth. Bryant entered the sopho-

more class at Williams College in 1810, but before the year was ended withdrew, intending to enter the junior class at Yale. His father's means not permitting this, he began the study of law in the adjoining town of Worthington, but continued to cultivate his gifts, producing the noble poem *Thanatopsis*, one of the most impressive known in the English language. In 1814 he removed to Bridgewater, Plymouth co., his father's birth-place, to finish his studies, and in 1815 was admitted to the bar at Plymouth. Returning to Hampshire co., he practiced for eight months at Plainfield, and then removed to a wider field, Great Barrington, where he distinguished himself as a lawyer and orator, and where, in 1821, he married Miss Frances Fairchild. *Thanatopsis* was published, in 1817, in the *North American Review*, exciting general admiration, and among other contributions to the same periodical was his first ambitious prose composition, an *Essay on American Poetry*. In 1821 he read, by invitation, a didactic poem, *The Ages*, before the Phi Beta Kappa Society of Harvard College, and in that same year published at Cambridge a volume of his collected poems. His distaste for the law increasing, he decided to give literature the preference, and by the advice of friends removed to New York, in 1825, to become the editor of the *New York Review*, an unsuccessful venture.

In 1826 he was made assistant editor of the *Evening Post*, and in 1829 editor-in-chief. Under him the paper became decidedly democratic, but its editor entered warmly into the anti-slavery struggle, and in 1856 aided in forming the Republican Party, giving most efficient support to the government during the civil war. Chiefly owing to Bryant, the *Post* early became noted for its dignity and high moral tone, and for its bold advocacy of free-trade and of international copyright laws. From 1827 to 1830 Bryant aided in editing *The Talisman*, a popular annual. In 1832 a complete collection of his poems appeared, which was reprinted in London with a flattering preface by Washington Irving. This received high praise from English critics, and was followed by *The Fountain and Other Poems* (1842); *The White-Footed Deer and Other Poems* (1844); an illustrated edition of his poems (1846); a complete edition in two vols. (1855); *Thirty Poems* (1864); a translation of the *Iliad* (1870); and of the *Odyssey* (1871), work on these having been commenced in 1866. After 1845 Roslyn, L.I., was one of Bryant's summer homes, Cummington and its beautiful scenery still keeping their hold upon his affections. In 1834, 1845, 1849, and 1857 Bryant visited Europe. In 1849 extending his travels to Egypt and Syria; and his letters to the *Post* were republished as *Letters of a Traveler*, and *Letters from Spain and other Countries*. Among other works, original or compiled, were *The Library of Poetry and Song* (1876); with Sidney Howard Gay, a *Popular Illustrated History of the United States* (1878-82), and with E. A. Duyckinck, a new edition of *Shakespeare*. Few men in public life were as widely honored for culture, wisdom and probity as Bryant, and he was frequently called on to address assemblies gathered to commemorate the lives and works of eminent persons. His literary friends found expression for their esteem by a festival at the Century club in 1864, on the completion of his seventieth birthday, and again in 1876, when he was presented with a beautiful silver vase, ornamented with designs representing the flowers and birds about which he had so lovingly written. He died from the effects of a fall, June 12, 1878.

In his *Poets and Poetry of America*, Griswold characterizes Bryant's poetry as "permeated by a pure and genial philosophy, a solemn and religious tone that influences the fancy, the understanding and the heart." His prose is marked by the same elegance, clearness, vigor, and purity of diction, and a feature of both is an intimate and loving acquaintance with nature. See the complete edition of his works (4 vols., 1883-84); the *Life*, by his son-in-law, Parke Godwin (2 vols., 1883); *Prose Writings of William Cullen Bryant* (2 vols., 1884); *Bryant and His Friends*, by James Grant Wilson (1886).

BRYAXIS, a Greek sculptor, contemporary of Praxiteles and Scopas, with whom he participated in the work on the mausoleum at Halicarnassus about 345 B.C. He also created five colossal figures of the gods at Rhodes, of Bacchus at Cnidus, of Æsculapius and Hygeia at Megara, Apollo in the grove of Daphne at Antioch, a statue of Paspiphæ, and a portrait of Seleucus. It is thought that B. was the first to produce statues of Æsculapius and Serapis.

BRYCE, JAMES, b. Belfast, 1838; educated at Glasgow University and at Trinity coll., Oxford. He was called to the bar in 1877; was Regius prof. of civil law, Oxford, in 1870-93; became a member of the House of Commons, 1880; parliamentary secretary of foreign affairs in 1886; and President of the Board of Trade in 1894. He is the author of *The Holy Roman Empire*; *Travels in Transcaucasia*; *The American Commonwealth* (1889).

BRYDGES, Sir SAMUEL EGERTON, 1762-1837; an English author, bred to the law. He was a prolific writer, and is said to have produced 2000 sonnets in a single year. His more important works are *Censura Literaria* in 10 vols., *The British Bibliographer* (4 vols., 1810-14), and his own *Autobiography, Times and Opinions*.

BRYENNIOS, PHILOTHEOS, b. of Greek parents near Constantinople, 1833; educated in the Patriarchal seminary at Chalce, and attended courses at the universities of Berlin, Leipsic, and Munich, where he became familiar with German theology. He consorted with western theologians more frequently than is customary for Greek

ecclesiastics, and attended the Bonn conference of Old Catholics, 1875. He was prof. of church history at Chalc; metropolitan of Serra; and afterward metropolitan of Nicomedia, in ancient Mesopotamia. He was the discoverer of two *Epistles of Clement*, and of *The Teaching of the Twelve Apostles*, the publication of the latter, in 1883, being one of the most notable theological events of the day. Both manuscripts were found in the monastery of the Holy Sepulchre, Constantinople. See TEACHING OF THE TWELVE APOSTLES.

BRYN MAWR COLLEGE, at Bryn Mawr, Pa., five miles from Philadelphia, was founded by Joseph W. Taylor, M.D., a member of the Society of Friends, of Burlington, N. J. Dr. Taylor's object was to found an institution for the advanced education of women. In 1879 he purchased land and began the erection of buildings. At his death in 1880, he bequeathed \$800,000 to the college. The officers of administration and instruction were chosen in 1884, and in the fall of 1885 the college opened with 44 students. The trustees are members of the Society of Friends, but the students may be of any denomination. The buildings of the college include Taylor Hall, which contains lecture-rooms, chemical, physical, and biological laboratories, and the offices of administration; and five halls of residence, two of which, Pembroke Hall and Denbigh Hall, accommodating 132 and 60 students respectively were opened in 1891 and 1894 respectively. A third hall of residence, known as Denbigh Hall, was opened in the fall of 1890. A well-equipped gymnasium with swimming pool is open to the students. The library contains 25,000 bound volumes and 7000 pamphlets. The number of students in the year 1896-7 was 289, of whom 46 were graduates, the remaining 243 undergraduates. The number of professors is 15, of other instructors 34. Eleven fellowships, in Greek, English, mathematics, history, and biology, are awarded annually, and there are three European Fellowships conferred upon members of the graduating class, who receive the sum of \$500 to defray the expenses of a year's study in some foreign university.

BRYOLOGY (Gr. *bruon*, a moss; *logos*, discourse), a subdivision of botany; that part of the science of botany which treats of mosses. The term *muscology* (from Latin *muscus*, moss) is also employed as synonymous with bryology.

BRY'ONY, *Bryonia*, a genus of plants of the natural order *cucurbitaceæ*, distinguished by triadelphous stamens, with distinct anthers, a trifid style, and a few-seeded fruit destitute of hard rind. The stems climb by means of lateral tendrils, the leaves are angular or 3 to 5-lobed, and the flowers campanulate, 5-partite, unisexual, and generally yellow. The COMMON BRYONY (*B. dioica*), the only British species, is frequent in hedgerows in England, but is not indigenous to Scotland. It has cordate palmate leaves, axillary bunches of flowers, and red berries about the size of a pea. It abounds in a fetid and acrid juice. The root is perennial, very large, white and branched, has a repulsive smell, and is acrid, purgative, and emetic. *B. alba*, common in the middle parts of Europe, possesses similar properties. The root of both is applied topically to bruises, and was formerly very much in use as a purgative. It is now again much employed in homeopathic practice. A decoction made of 1 lb. of the fresh root is said by Withering to be "the best purge for horned cattle." It contains a bitter extractive, called *bryonaine*, to which it seems to owe its properties. The young shoots of both species are, however, so free from acrid and dangerous qualities, that they may be used as pot-herbs.—The roots of other species of the genus are also acrid and purgative; but it is said that the root of *B. Abyssinica*, when cooked, is eaten without danger.—BLACK BRYONY (*tamus communis*) is a plant of a different natural order (*dioscoreaceæ*, q. v.).

BRYOPHYLLUM (Gr. *bryon*, blossom, and *phyllon*, leaf), a genus of plants of the natural order *crassulaceæ* (q. v.). *B. calycinum*, a succulent shrubby plant, a native of the Moluccas, with quinate or almost pinnate leaves, oblong deeply-crenulated leaflets, and panicles of large pendulous greenish-yellow flowers, is not unfrequent in American hot-houses, being regarded as an object of interest, upon account of its producing buds on the edges of the leaves more frequently than almost any other plant. These buds are capable of forming independent plants. This curious mode of propagation is found also in the bog orchis (*malaxis paludosa*), a plant of a very different natural order. See BUD and LEAVES.

BRYOZO'A. See ZOOPHYTES.

BRY'UM (Gr. *bryon*, moss), a genus of mosses (q. v.) distinguished by a terminal fruit-stalk, a double *peristome* (see MOSSES)—the outer one of 16 teeth, the inner a membrane cut into 16 equal segments—and a dimidiate *calyptra*. The species are very numerous, and many of them are natives of Britain. They are all small, their stems short, and their leaves forming little rosettes, from the center of which the fruit stalk springs. They very generally grow in dense patches on wet rocks, wet earth, the bark of trees, etc., beautifully clothing them with bright green.

BRZESC, or BREST LITOVSKI, a walled t. of Russia, in the government of Grodno, about 108 m. s. from the city of the same name. Being advantageously situated on the right bank of the Bug, it has an extensive trade. It was the scene of a battle between the Russians and Poles in 1794. Pop. '92, 44,140.

BRZE'ZAN, a t. of Galicia, situated on the Zlota-Lipa, about 50 m. s.e. of Lemberg. It has an old castle and a gymnasium, and manufactures of linen, sail-cloth, and leather. Pop. '90, 11,221.

BUACHE, or **GARDEN ISLAND**, an island of Western Australia, near the mouth of Swan river, in lat. $32^{\circ} 10'$ s., and long. $115^{\circ} 40'$ east. Though measuring only 6 m. by 1, it is yet important as sheltering from the open ocean the deep and spacious anchorage of Cockburn sound, which flows between it and the mainland of the colony.

BUANSUAH, a wild dog of India, conjectured to be the progenitor of the domestic animal. It is very shy, lives in thick woods, and, like the wolf, hunts in packs. In companies of a dozen these animals do not fear to attack the tiger. If captured young they are easily tamed.

BU'AZE, a s. African plant, of which the botanical characters and relations are not yet known, but which is likely to prove of importance on account of its fiber. Dr. Livingstone found it growing in large quantities in the Maravi country, n. of the Zambezi; but he could not procure any specimen in flower or fruit, and Dr. Hooker did not recognize the specimens of branches and leaves. It is not cultivated, and the only use to which it is put by the natives is to afford threads for stringing beads on; but Dr. Livingstone thinks its fiber stronger and finer than flax, and says that a firm thread of it feels like catgut in the hand, and would rather cut the fingers than break.

BU'BALUS, **BU'BALIS**, or **BU'BALÉ**, *Antelope bubalus*, supposed to be the *bubalus* of the ancients—although that name is now generally appropriated to the buffalo (q.v.)—a species of antelope, of that section of the genus which is characterized as *bovi*-form or *ox*-like. The Arabic name is *bekker-el-wash*, which signifies wild ox. It is an animal about the size of a large stag, with very ox-like head and muzzle—the head, however, remarkably long; the horns about as long as the head, surrounded by a succession of thickened rings, curved so as somewhat to resemble the sides of a lyre, the points directed backward. The general color is yellowish-brown, but the tail is terminated by a black tuft. The B. is an animal of rather coarse appearance, very destitute of the gracefulness of the typical antelopes. It inhabits Barbary, and occasional wanderers make their way to the banks of the Nile. It is figured on the monuments of ancient Egypt. It is gregarious in its habits. It is said to be easily domesticated. The most nearly related species to this, of other antelopes known, is the *kaama* (q.v.) of s. Africa.

BUBASTIS, a goddess of the Egyptians, was, in their mythology, the child of Isis and Osiris, and the sister of Horus. She was identified by the Greeks with Artemis (Diana), though upon what grounds is unknown, as the best information with regard to her is, that she was the goddess who presided over pregnancy and childbirth. The chief temple erected to B. was at Bubastis (q.v.). B. is represented on monuments as having the head of a cat, an animal which was sacred to her.

BUBASTIS (the *Pi-beseth* of Scripture, and modern *Tel Basta*), a ruined city of Egypt, about 14 m. n. of Belbeys, in lat. $30^{\circ} 36'$ n., and long. $31^{\circ} 33'$ east. B. derived its name from the Egyptian goddess Bubastis, in whose honor a temple was erected here, which, if not so large and magnificent as some Egyptian temples, was, according to Herodotus, one of the most beautiful, and vast numbers of persons were wont to make annual pilgrimages to it. Nothing but some stones of the temple, which are of the finest red granite, now remain. There are some other ruins, and mounds of great extent, consisting chiefly of the remains of brick houses and heaps of broken pottery.

BUBBLE, as a term, is defined by Blackstone as an unwarrantable undertaking by unlawful subscriptions, subjecting the parties who originate and put them in operation to the penalties of *premunire* (q.v.). The *South-sea scheme* (q.v.) was a terrible example of such a bubble.—The **BUBBLE ACT** is the name given to the 6 Geo. I. c. 18, "enacted," says Blackstone, "in the year after the infamous South-sea project had beggared half the nation," and which public fraud the act was intended to punish. But it was repealed by the 6 Geo. IV. c. 91, which at the same time left such companies to be dealt with by the common law.

BUBBLE SHELL. See **BULLA**.

BUBO, an inflammatory tumor, seated in the groin or the armpit. See **SYPHILIS**.

BUBO. See **OWL**.

BUCCANEERS, a celebrated association of piratical adventurers, who, from the commencement of the second quarter of the 16th c., to the end of the 17th, maintained themselves in the Caribbean seas, at first by systematic reprisals on the Spaniards, latterly, by less justifiable and indiscriminate piracy. The name is derived from the Caribbee *boucan*, a term for preserved meat, smoke-dried in a peculiar manner. From this the French adventurers formed the verb *boucaner* and the noun *boucanier*, which was adopted by the English; while, singularly enough, the French used, in preference, the word *flibustier* (see **FLIBUSTER**). a corruption of our "freebooter." The B. were also sometimes called "brethren of the coast." The arrogant assumption by the Spaniards of a divine right—sanctioned by the pope's bull—to the whole new world, was not, of course, to be tolerated by the enterprising mariners of England and France; and the enormous cruelties practiced by them upon all foreign interlopers, of which the history of that time is full, naturally led to an association for mutual defense among the adventurers of all other nations, but particularly among the English and French. The fundamental principles of their policy—for they, in course of time, formed distinct commu-

nities—were close mutual alliance, and mortal war with all that was Spanish. Their simple code of laws bound them to a common participation in the necessities of life; locks and bars were proscribed as an insult to the general honor; and every man had his comrade, who stood by him when alive, and succeeded to his property after his death. The principal center of their wild and predatory life was for some time the island of Tortuga, near St. Domingo. When they were not hunting Spaniards, or being hunted themselves, their chief occupation and means of subsistence was the chase. From the flesh of wild cattle they made their "boucan;" their skins and tallow they sold or bartered to Dutch and other traders. The history of these men embraces, as may be supposed, narratives of cruelty and bloodshed unsurpassed in the annals of crime. It has, however, not a few stories of high and romantic adventure, of chivalrous valor, and brilliant generalship. Among the "great captains" whose names figure most prominently in the records of buccaneering, were the Frenchman Montbars, surnamed by the terrible title of "the exterminator;" his countrymen, Peter of Dieppe, surnamed "the great"—as truly, perhaps, as others so distinguished—and L'Olonnas, Michael de Busco, and Bartolomeo de Portuguez, Mansvelt, and Van Horn. Pre-eminent, however, among them all was the Welshman, Henry Morgan, who organized fleets and armies, took strong fortresses and rich cities, and displayed throughout the bold genius of a born commander. He it was that led the way for the B. to the southern ocean, by his daring march in 1670 across the isthmus of Panama to the city of that name, which he took and plundered after a desperate battle. This brilliant but most unscrupulous personage was knighted by Charles II., and became deputy-governor of Jamaica. A higher subordination of the love of gold to the passion for dominion in him, might probably have made him emperor of the West Indies, some dream of which seems at one time to have occupied his mind. In 1680 and 1689, extensive buccaneering expeditions were made to the Pacific, even as far as the coasts of China, of which the best record is preserved in the lively pages of William Dampier, himself an important partner in these bold adventures. The war between France and Britain, after the accession of William III., dissolved the ancient alliance of the French and English buccaneers. After the peace of Ryswick, and the accession of the Bourbon Philip V. to the Spanish crown (1701), they finally disappeared, to make way for a race of mere cut-throats and vulgar desperadoes, not yet utterly extinct. The last great event in their history was the capture of Carthagena in 1697, where the booty was enormous. See the *History of Burney*; Thornbury, *Monarchs of the Main* (1855); Dampier's *Voyages*; *Les Filibustiers au XVII^e Siècle* (Limoges, 1884); Pyle, *Buccaneers and Marooners* (N. Y. 1891).

BUCCA'RI, or **BAKAR**, a free port of Austrian Croatia, on an inlet of the gulf of Quarnero, 5 m. e.s.e. from Fiume. It is beautifully situated on the slope of a hill, and has a small but very good and safe harbor. The linen manufacture is carried on here, and ship-building is actively prosecuted; but the inhabitants are principally sailors and fishermen. The tunny fishery is the chief fishery of this part of the Adriatic. The vine is extensively cultivated in the neighborhood of B., and good wine is made. Pop. about 2000.

BUCCINA TOR (from Lat. *buccinare*, to sound a trumpet), the name of a muscle, situated in the substance of the cheeks; it is so called because, when the cheeks are distended with air, the contraction of the B. muscles forces it out.

BUCCI'NO, a t. of s. Italy, in the province of Salerno, pleasantly situated on the Botta, which at this point is crossed by an old Roman bridge, about 14 m. e. from Campagna. In its vicinity are quarries yielding fine marble. Pop. between 6000 and 7000.

BUCCINUM. See **WHEELK**.

BUCCLEUCH'. The Scotts, dukes of B., are one of the oldest and most distinguished families in Scotland. The family traces its descent from sir Richard le Scott, in the reign of Alexander III. (1249-85); but the ancestor who first becomes historically conspicuous is sir Walter Scott of Braxholm and B., a brave and powerful chieftain on the border. B., which from this early period was destined to be associated with the family title, is a lonely estate in the vale of Rankleburn, at the head of Etrick, Selkirkshire. The sir Walter alluded to flourished in the reign of James V., and on some incidents in his life, his great namesake founded the *Lay of the Last Minstrel*. Sir Walter fought bravely at the battle of Pinkie, 1547, and was slain in an encounter with sir Walter Kerr of Cessford in the streets of Edinburgh, 1552. He was succeeded by his grandson, sir Walter Scott of B., a knight "wise, true, and modest," who was succeeded by his only son, who bore the same name. This sir Walter is celebrated for his military exploits on the border, not the least daring of his enterprises being the rescue of one of his attendants, Kinmont Willie, from the castle of Carlisle. (See *Minstrelsy of the Scottish Border*.) For his services to the state, in which is to be reckoned his carrying away of large numbers of the border marauders to foreign wars, he was raised to the peerage, 1606, as lord Scott of Buccleuch. Dying in 1611, he was succeeded by his only son, Walter, who, in 1619, received an elevation in the peerage, as lord Whitchester and Eskdale, and earl of Buccleuch. Through his son Francis, the second earl, the family, by a grant, acquired the extensive domain of Liddesdale, formerly belonging to the house of Bothwell; also, by purchase, large territories in Eskdale; and in 1642, the barony of Dalkeith from the

Morton family. Francis left only two daughters, the eldest of whom dying without issue, the titles and estates went to her sister, Anne, who, in 1663, was married to James, duke of Monmouth, an illegitimate son of Charles II. In 1673, this pair were created duke and duchess of B., earl and countess of Dalkeith, etc. After a marriage of twenty-two years, the unhappy duke, on a charge of rebellion, was tried and beheaded, 1685; the duchess, however, retaining her honors, title, and estates, as in her own right. The duke left a family of four sons and two daughters. The duchess afterwards married Lord Cornwallis, by whom she had a son and two daughters, and died in 1732, at Dalkeith house, where she had occasionally resided in princely splendor. James, her eldest surviving son, pre-deceased his mother, and his son, Francis, by the death of his grandmother, succeeded to the title of duke of Buccleuch. Notwithstanding the connection with the son of Charles II., the family still preserved the surname of Scott. Duke Francis, in 1743, obtained a restoration of his grandfather Monmouth's earldom of Doncaster and barony of Tynedale, and was hence a British peer. In 1720, he married a daughter of James, second duke of Queensberry, and by this fortunate connection, a portion of the Queensberry estates, along with the dukedom, merged in the family of B. in 1810. Henry, third duke of B., born in 1746, was the greatest and most estimable of his family. He had for his tutor and friend Dr. Adam Smith, and his beneficent talents were directed towards the improvement of his extensive estates in the south of Scotland. The amelioration of the soil, the planting of trees, the making of roads, the improving of the breed of sheep, and the social elevation of his numerous tenantry, uniformly engaged his attention. He died in 1812, and was succeeded by his eldest son, Charles, fourth duke, who, dying in 1814, was succeeded by his son, Walter Francis, born 1806, who bore the title of duke of B. and Queensberry, marquis of Dumfriesshire, etc., in the peerage of Scotland; and earl of Doncaster, etc., in the peerage of England. The duke, like his grandfather, was noted for the improvement of his estates, which in Scotland are situated in Mid-Lothian, Dumfriesshire, Roxburghshire, Selkirkshire, Peeblesshire, Lanarkshire, and stewartry of Kirkcudbright; his farms everywhere being noted for their good steadings and thriving tenantry. As an heritor, the number of churches and school-houses which the duke was concerned in building is very considerable. He had one small possession in Fife—the island of Inchkeith (q. v.). The greatest public improvement ever executed in Scotland by an individual at his own private cost, was carried out by the duke of B. at vast expense. We allude to the creation of the deep-water harbor and port of Granton, on the firth of Forth, 2 m. from Edinburgh. The duke of B. was one of the chief patrons of church livings in Scotland, but waived all claim to compensation when patronage was abolished in 1874. He was lord-lieutenant of Mid-Lothian and Roxburghshire, and captain of the Queen's bodyguard in Scotland. He died in 1884 and was succeeded in the title by his son William Henry Walter, b. 1831.

BUCEN TAUR, the name of a ship which acquired much celebrity in Venice at a time when that state was a flourishing republic. A B. was known as early as the end of the 12th c.; and a vessel of the same name was burnt when the French took Venice more than six centuries afterwards; but it is not certain whether this was the same vessel, maintained by being repeatedly patched up with new ribs and planking. The B. is described as having been a galley, about 100 ft. long by 21 in extreme breadth; on a lower deck were 32 banks or rows of oars, manned by 168 rowers; and on an upper deck was accommodation for the illustrious visitors who occasionally came on board. The whole of the fittings were of the most gorgeous character. Although propelled mainly by oars, there were 40 mariners employed in other ways to manage the galley. The B. was employed only once a year, when the doge "married the Adriatic." A splendid water-procession was formed, with the doge and the chief notables in the B., and other distinguished persons in gondolas and feluccas; and when the vessels arrived at the mouth of one of the channels opening into the Adriatic, the doge dropped a ring into the water, using the words: "We wed thee with this ring in token of our true and perpetual sovereignty." This singular ceremony, which took place on Ascension day, arose out of an honor or privilege conferred by the pope on the doge in 1177, consequent on a splendid victory gained by the Venetians over the emperor Frederick Barbarossa.

BUCEPHALUS (Gr. meaning "ox-head"), the name of the favorite charger of Alexander the great, was probably also the name of a peculiar breed of horses in Thessaly. According to tradition, Alexander in his boyhood was the first to break in the steed B., and thus fulfilled the condition stated by an oracle as necessary for gaining the crown of Macedon.—The town **BUCEPHALIA**, on the river Hydaspes, in India, was founded near the grave of B. which died during Alexander's Indian expedition.

BUCER, MARTIN, one of the church reformers of the 16th c., was b. 1491, at Schlettstadt in Alsace. His real name was *Kuhhorn* (cow-horn), but in accordance with the fashion of his time among scholars, he changed it into its Greek equivalent, Bucer being derived from *bous*, an ox, and *keras*, a horn. At the age of 14 he entered the order of Dominicans. At the suggestion of his superior, he went to Heidelberg to study theology, devoting his attention, however, at the same time to the Greek and Hebrew languages. While young he was appointed chaplain to the elector of the palatinate. An acquaintance with the works of Erasmus had already inclined B. toward Protestantism,

and his views were confirmed by the influence of Luther at the Heidelberg disputations in 1518. Following the example given by Luther at the diet of Worms (1521), B. became one of the boldest and most decided of the German reformers. In 1523, he went to Strasburg, where he introduced the doctrines of the reformation. In the disputes between Luther and Zwingli, he adopted a middle course, and endeavored to make reconciliation between them; but his view of the sacraments, which approached that of Zwingli, exposed him to Luther's harsh reprobation. At the diet of Augsburg, where he conducted himself with great circumspection and moderation, he generally accorded with the Lutheran views; but, along with other Strasburg theologians, declined to subscribe to the proposed confession of faith, and afterwards drew up the *Confessio Tetrapolitana*. An agreement, however, was subsequently entered into between B. and the Lutherans, and as a disciple of Luther, he appeared at the religious conference of the reformers held at Leipsic. In consequence of his refusal to sign the *Interim*—a temporary creed drawn up by order of the emperor Charles V.—B. found his situation irksome in Germany, and therefore accepted the invitation of archbishop Crammer (1549), and came to England to teach theology at Cambridge, and assist Paul Fagius and others in forwarding the reformation. His modesty, blameless life, and great learning gained many friends in England; but his labors were soon interrupted by death, Feb. 27, 1551. His remains were interred in a church at Cambridge with great solemnity; but during the reign of Mary, his bones, with those of Fagius, were taken from their graves and burned in the market-place. His constant attempts to express himself in language agreeable both to Luther and Zwingli, induced in him at times an obscure, ambiguous, and elusive kind of thought, to which, perhaps, Bossuet refers when he stigmatizes B. as "the great architect of subtleties." The religious passions of the time prevented his contemporaries from forming a fair estimate of his character. By some Protestant writers he is ranked as a theologian above even Luther and Melancthon. His best work is a translation and exposition of the Psalms, which he published under the pseudonym Aretinus Felinus (Strasburg, 1529). Hubert intended to edit the whole of B.'s writings in ten volumes, but only one volume appeared (Basel, 1577). See Baum, *Capito und Bucer* (1860), and Tollin, *Servet und Bucer* (1880).

BU' CEROS. See HORNBEILL.

BUCH, LEOPOLD VON, one of the most celebrated of German geologists, was b. at Stolpe, in Prussia, April 26, 1774, and received instruction under Werner at the mining academy, Freiburg. He afterwards traveled in pursuit of his favorite science, through all the states of Germany, through Scandinavia, as far as the North cape, and through several parts of Great Britain, France, and Italy, visiting the Canary islands in 1815. His chief writings are—*Geological Observations during Travels in Germany and Italy* (1802–1809); a *Physical Description of the Canary Islands* (1825); *Travels in Norway and Lapland* (1810); and essays *On the Jura in Germany* (1839); and *On the Mountain Systems of Russia* (1840), with several monographs on Ammonites (1832) and other fossils. He was also the author of an excellent geological chart of Germany and its neighboring states, published in 42 plates (2d ed., Berlin, 1832). He died in Berlin, Mar. 4, 1853. B. has been described by an eminent scientific man as "the only geologist who has attained an equal fame in the physical, the descriptive, and the natural history departments of his science. In all these he has been an originator and a discoverer."

BUCHAN, the n.e. district of Aberdeenshire, consisting of about a fourth of the county, lying between the Ytham and the Doveran. Its surface is undulating, the highest points being Mormond hill in the n., 742 ft., and Dudwick hill in the s., 562 feet. Portions of the coast are bold and precipitous, especially for a few m. e. of the Doveran mouth, where Troup head is 600 ft. high, and s. of Peterhead, where the coasts rise from 70 to 100 feet. Among the rocks five m. s. of this town are the famous Boulders of B., a huge vertical well in the granite margin of the sea, 50 ft. diameter, and 100 ft. deep, into the bottom of which the sea rushes by a natural archway, and, in storms, dashes up the sides with great violence. The eastern parts of B. consist chiefly of granite and gneiss, and the western of clay-slate and old red sandstone. The chief seats of population are Peterhead, Fraserburg, Macduff, and Turriff. B. contains several so-called Druid circles, as well as the remains of the abbey of Deer, and of several castles belonging to the Comyns, who held the earldom of B., but forfeited their title and property in 1309.

BUCHAN, DAVID, 1780–abt. 1837; an officer in the British navy who spent many years in explorations in the north polar seas. In 1810 he commanded a schooner on the Newfoundland station, and made a trip up the river of Exploits, the largest stream in Newfoundland. In 1818, he commanded an arctic expedition for the discovery of the north pole. He reached 80° 34', but was caught in the ice and drifted about between Greenland and Spitzbergen until his vessel was disabled, when he managed to return to England. In 1823, he was commander on the Newfoundland station, and in 1825 high-sheriff of the colony. A few years later he sailed again for the arctic seas, and was never afterwards heard from. He made many important scientific observations concerning the variation of the needle and ocean currents.

BUCHANAN, a co. in n.e. Iowa, watered by tributaries of the Red Cedar river; 576 sq. m.; pop. '70, 17,034, in '90, 18,997. It is tolerably level and well timbered. The Illinois Central railroad traverses the co. near the central portion. Productions chiefly agricultural. Co. seat, Independence.

BUCHANAN, a co. in n.w. Missouri, on the Missouri river; 420 sq. m.; pop. '90, 70,100 includ. colored. Eight main and branch railroads traverse the county. The soil is fertile; productions chiefly agricultural. Co. seat, St. Joseph.

BUCHANAN, a co. in s.w. Virginia, on the Kentucky border, bounded n.w. by the Cumberland mountains; 440 sq. m.; pop. '70, 3777; in '90, 5867. The surface is rough and much of it mountainous. Agriculture is the chief occupation. Co. seat, Grundy.

BUCHANAN, FRANKLIN, b. Md., Sept. 17, 1800; a midshipman in 1815, and in 1845 the first superintendent of the U. S. naval academy. In 1855 he was made a capt., and in 1861 had command of the Washington navy-yard. He resigned when the civil war broke out, but as his state did not leave the union, he asked to be restored. This was refused, and he went over to the confederates, having command of the *Merrimac* in the attack upon the union fleet in Hampton Roads, in which engagement he was wounded. In August, 1864, as admiral, he commanded the confederate fleet so thoroughly defeated by Farragut in Mobile bay. On that occasion he lost a leg and was taken prisoner, but was released when the war closed. He was subsequently president of the Maryland Agricultural College, and still later an insurance agent. He d. 1874.

BUCHANAN, GEORGE, one of the most learned men of the 16th c., and a distinguished poet and historian, was b. of poor parents in Killearn, in the co. of Stirling, in Feb., 1506. He was sent to the university of Paris by his uncle, who died two years afterwards, leaving B. without the means of prosecuting his studies. He returned home, served in one campaign against the English, and entered St. Andrews university in 1524, where, in the following year, he took his degree of b.a. In 1526, he went to Paris, and became a student in the Scots college there. He subsequently obtained a professorship in the college of St. Barbe, but returned to Scotland about 1537. During his residence on the continent, B. adopted the tenets of the reformed faith. A satire entitled *Somnium*, exposing the Franciscans, brought down upon him the wrath of the priests; and he had resolved upon seeking safety in his old college at Paris, when king James V. took him under his protection, and intrusted him with the education of one of his illegitimate sons. At the request of the king, B. wrote another and more pungent satire against the monks, entitled *Franciscanus*, increasing their anger, and rousing especially the bitter hatred of the powerful cardinal Beaton, who after a time procured B.'s arrest, and even went so far as to offer the king money for his life. Though to James was entirely due the publication of the offensive satire, he did not interfere to protect the poet, who, however, contrived to effect his escape to Paris. After spending some years at Bordeaux and Paris in tuition, he accompanied the learned Portuguese, Govea, to the university of Coimbra, in Portugal, as one of his associates. After the death of Govea, B. was arrested as a heretic, and was for some time detained in a monastery, where he began his splendid Latin metrical version of the Psalms. In 1551, being restored to liberty, he went to England; but soon afterwards went to Paris. About 1560, he returned to Scotland, where he made an open confession of Protestantism. His reputation as a scholar gained for him a good reception at the court of the young queen, Mary, whose classical tutor he became. But his religious and political principles attached him to the party of the regent Moray, by whose influence he was appointed principal of St. Leonard's college, in St. Andrews university, in 1566. In the following year, he was chosen moderator of the general assembly—a very high honor for a layman. The doings of Mary, which scandalized the Scottish public, disgusted her tutor also, and he accompanied the regent Moray to England, in order to give evidence against her before the commissioners appointed by Elizabeth to inquire into her guilt. His *Detectio Mariæ Reginae*, laid before these functionaries, was industriously circulated by the English court. In 1570, B. was appointed tutor to the young king, James VI. (afterwards James I.), who owed to him all the erudition of which in later life he was so vain. No considerations of the future position of his pupil were allowed to interfere with B.'s treatment of him, which was strict, if not even stern; and in dedicating his *De Jure Regni apud Scotos* to the young monarch in 1579, he warned him against favorites with a freedom remarkable not only in a subservient but in any age. In 1570, B. was appointed director of chancery, which he soon resigned, and in the same year was made keeper of the privy seal, an office which he retained until within a short time of his death. The latter years of his life were devoted to the composition of his *History of Scotland* (published in 1582). He died thirty days after its publication, on the 28th Sept., 1582, and was buried in Greyfriars churchyard, Edinburgh. As a scholar, B. was unrivaled in his age; and he wrote Latin poetry "with the purity and elegance of an ancient Roman." He was alike humorous, sarcastic, and profound. His *History*, written in Latin, is remarkable for the richness, force, and perspicuity of its style, though it has been found fault with for the partiality of its narration of contemporary events; and two years after the author's death, it, as

well as *De Jure Regni*, etc., was condemned by the Scottish parliament, and every person possessed of copies was ordered to surrender them within 40 days, in order that they might be purged of "the offensive and extraordinary matters" they contained. Two collected editions of B.'s works have been published—one by Ruddiman in 1715, 2 vols. folio; and another by Burman, Leyden, in 2 vols. quarto, in 1725. The translations that have yet appeared are far from doing justice to the original.

BUCHANAN, JAMES, the fifteenth elected president of the United States, filling the 18th presidential term (1857-61); b. at Stony Batter, Franklin co., Penn., April 22, 1791; d. Lancaster, Penn., June 1, 1868. He was the son of an Irish emigrant and an American mother, educated at Dickinson college, bred to the law, and admitted to practice in 1812. Though a professed federalist, he served as a private in the war with England. In 1814, he was a member of the Pennsylvania legislature, and in 1820 was elected to congress, where he served through five terms. In 1828, he favored Jackson for president, and in the congress of 1829-31 was chairman of the committee on the judiciary. After leaving congress, Jackson sent him as minister to Russia, where he concluded the first commercial treaty between the two countries, securing valuable privileges in the Black and Baltic seas. In 1833, he was chosen to the United States senate, where he supported Jackson, especially in the claim that appointments might be made by the president alone when the senate was not in session. When it was proposed to exclude from congress petitions for the abolition of slavery, B. desired to prevent even the discussion of slavery by congress, proposing to leave the matter solely to the slaveholding states, and holding that congress had no power over it. He favored the recognition of Texan independence, and the annexation of that republic to the United States. In the affair of the French indemnity, he supported Jackson's demand for payment or war. During Van Buren's administration Buchanan supported the independent treasury scheme; favored the pre-emption of public lands, and opposed the bill to prevent the interference of federal officers in elections. He sustained the veto power under Tyler, and opposed the ratification of the Ashburton treaty, which settled the dispute concerning the northern boundary. When the question of the annexation of Texas came to the senate there were but 15 votes in its favor, but the measure was carried in the form of joint resolutions only three days before the close of the term of congress. B. was the only member of the senate committee of foreign affairs to report in favor of annexation. Polk made him secretary of state. In this position he had to deal with the north-western boundary question, whence arose the famous partisan cry "54° 40' or fight." Both England and the United States had formally claimed the territory between the Pacific coast and the Rocky mountains up to the Russian boundary, but after much negotiation the line of 49° n. lat. was agreed upon. During the war with Mexico, B. was busy in avoiding or preventing the interference of other nations. He was in private life during the discussion and adoption of the compromise measures of 1850, but fully approved them. When Pierce came into office in 1853, he sent B. as minister to Great Britain, where he was engaged in endeavors to settle a series of questions concerning Central American affairs. In the course of these duties he was present at the Ostend conference, the object of which was to bring about the sale of Cuba to the United States; but nothing resulted beyond talk. In April, 1856, B. returned to the United States, and in June was nominated for president by the democratic party. The electoral vote was: for Buchanan, 174; for John C. Fremont (candidate of the newly organized republican party), 114; for Millard Fillmore (native-American), 8. The popular vote was: Buchanan, 1,838,169; Fremont, 1,341,264; Fillmore, 874,538; majority against Buchanan, 377,633; plurality for him, 496,905. He had the votes of every slaveholding state except Maryland, which went alone for Fillmore. The vote for Fillmore also gave Buchanan California and New Jersey. In the executive chair his effort was to smother and put out of sight the agitation concerning slavery not only in new states, but everywhere. Among other acts of his administration was the temporary pacification of the Mormon troubles, and the vetoing of the homestead bill. After Lincoln's election, B. was more than ever anxious to suppress the slavery discussion, and pointedly accused the north, in his last message to congress, as to blame for the impending disorder, because of that discussion, which had "produced its malign influence on the slaves, and inspired them with a vague idea of freedom." While holding that the executive ought to take care that the laws be faithfully executed, he shrunk before the secession of South Carolina, declaring that he could not employ force except upon the demand of the lawful authorities of the state, and in South Carolina no such authority then existed. His argument was that, if a state had withdrawn, or was even attempting to withdraw, from the union, there was no power in the constitution to prevent the act. A few days later he was confronted by commissioners from South Carolina (that state having passed an act of secession on the 20th Dec., 1860), who came to demand the surrender by the president to the seceded state of all public property, and to negotiate for the continuance of "peace and amity between that commonwealth and the government at Washington." His reply was that he had no power, and could only refer the matter to congress; he could only receive them as "private gentlemen of the highest character," and treat respectfully such propositions as they might make. He did, however, decline to accede to their demand for the removal of the troops from Charleston harbor. The cabinet immediately broke up. Gen. Cass was secretary of state, but resigned when the president refused to order reinforce-

ments to the Charleston ports; the secretary of the treasury and the secretary of the interior had already gone; Floyd, secretary of war, resigned because the president refused to withdraw the troops. The last official act of President Buchanan of any importance was characteristic of his whole course where the south and its institutions were concerned. It was embodied in a letter from the secretary of war (Holt) to the governor of South Carolina (Jan. 15, 1861), which declared, "by order of the president," that "the forts in that state, in common with the other forts, arsenals, and property of the United States, are in charge of the president, and that if assailed, no matter from what quarter or under what pretext, it is his duty to protect them by all the means which the law has placed at his disposal;" adding that it was not his present purpose to garrison the forts, as he "considered them entirely safe under the protection of the law-abiding sentiment for which the people of South Carolina had ever been distinguished; but should they be attacked or menaced with danger of being seized or taken from the possession of the United States, he could not escape from his constitutional obligations to defend and preserve them." After the installment of his successor, B. retired altogether from public affairs, but a year or two after the close of the civil war, he published a defense of his administration and the measures he adopted for the preservation of peace. He was never married. See *Life* by George Ticknor Curtis (2 vols., N. Y., 1883).

BUCHANAN, ROBERT CHRISTIE, 1810-78; b. Md. graduate of West Point, 1830, served meritoriously in the Black Hawk, Seminole and Mexican wars; was made brevet lieutenant-col. after the battle of Molino del Rey; was lieutenant-col., Fourth Infantry, in the army of the Potomac during the peninsular campaign; brevet col., June, 1862; brig.-gen., volunteers, Nov., 1862; col., First Infantry, Feb., 1864, commanding at New Orleans, Dec., 1864-Aug., 1865; brevet brig.-gen. U. S. A., Mch., 1865; brevet maj.-gen., the same year, and retired from service, Dec. 31, 1870.

BUCHANAN, ROBERT WILLIAMS, b. 1841; a poet of Scotland, educated at Glasgow university. In 1860 he published *Undertones*, a volume of verses; in 1865, *Idyls and London Poems*. In the same year he edited *Wayside Posies*, and translated ballads from the Danish. Among later works are *Napoleon Fallen—a Lyrical Drama*; *The Land of Lorne, including the Cruise of the Fern to the Outer Hebrides*; *The Drama of Kings*; *On the Fleshly School of Poetry* (a severe criticism of some living English poets); *Master Spirits*; *A Mad Prince* (acted at the Haymarket); *The City of Dreams* (1888); *The Wandering Jew* (1893); *Diana's Hunting* (1896), etc.

BUCHANITES, an extraordinary sect of fanatics, which sprang up in the w. of Scotland in 1783, but has now become extinct. The founder of the sect was Mrs. or Lucy Buchan, b. in Banffshire in 1738, of humble parentage. Her maiden name was Elspeth Simpson. She early fell into habits of vice, but with her licentiousness were combined a sort of religious fervor and extreme antinomian opinions. In 1782, being resident in Glasgow with her husband, a potter, who ultimately divorced her, she became acquainted with the Rev. Hugh White, minister of the Relief congregation in Irvine, a weak vain man and coarse declamatory preacher, who adopted her opinions, for which he was deposed by his presbytery, and began along with her to found a new sect in Irvine. Popular tumults arose, which led to her expulsion from the town in May, 1784. Mr. White and his wife, with other devoted adherents, male and female, accompanied her, regarding her as a divinely commissioned person, and expecting her to lead them to the place where Christ was speedily to appear again on earth. The sect became extinct in 1846.

BUCHAREST', BUKHAREST', or BUKHOREST', the chief city of Wallachia, and capital of Roumania, in a rich and extensive plain on the Dumbovitz, a tributary of the Arghis, in lat. 44° 26' n., and long. 26° 5' east. The town is for the most part meanly built, and the streets are very irregular and generally unpaved. There are, however, some handsome hotels; and the churches are numerous and many-spired, giving to the place a picturesque appearance. The prince's palace, a large structure in the center of the town, has no claim to architectural beauty. The number of cafés and gambling-tables is excessive; and altogether B. has the unenviable reputation of being the most dissolute capital in Europe. The *corso*, or public promenade, is a miniature Hyde Park. B. is the entrepôt for the trade between Turkey and Austria, the chief articles of commerce being grain, wool, salt, honey, wax, building-timber, and cattle. It has some small manufactures of woolen cloths and carpets. B. has at various times suffered considerably at the hands of the Russians, and is remarkable as the place where in 1812 a treaty was concluded between Turkey and Russia, by which the former ceded to the latter the province of Bessarabia and a portion of Moldavia; Russia waiving her claim to all other territories she had conquered. This treaty also defined the Pruth as the boundary-line between the two empires. Pop. 1894, estimated 232,000.

BUCHER, an unorganized co. in s.w. Tex.; drained by the San Francisco river, and intersected by the Southern Pacific railroad; area, 1440 sq. m.; pop. '90, 307.

BÜCHELER, FRANZ, German philologist, as renowned for his great learning, especially in grammar and epigraphy, as for his discriminating talent in criticism and his brilliant work as an academic instructor, was born at Rheinberg in 1837. He studied at Bonn, became professor in Freiburg in 1858, at Greifswald in 1866, and in 1870 returned to Bonn. His investigations in the department of ancient Italian dialects are very valuable. Especially important is his *Grundriss der lateinischen Deklination* (a new edition by Windekilde, with the admirable additions of the French translator, Haret, in 1879).

Some years previously he prepared a Latin grammar, treating exhaustively of sound and inflection. His *collectedaneu*, as well as his editions of various writers, give evidence of his genius for critical texts.

BUCHHOLTZ, REINHOLD, 1836-76; b. Germany. He was educated in the gymnasium of Königsberg, the Joachimsthal gymnasium of Berlin, and the medical departments of Greifswald and Berlin universities. After practicing a short time at Greifswald, he gave up medicine for zoology, and spent some time in Italy, studying marine life. He accompanied the North-Pole expedition of the Hansa, and wrote several articles on this subject. He was soon after made prof. in Greifswald university. He made an unsuccessful attempt, 1872, to explore the mouths of the Niger. In recognition of his services to science he was made, 1876, prof. ordinary at Greifswald.

BUCHNER, FRIEDRICH KARL CHRISTIAN LUDWIG, b. 1824; a German atheistic philosopher. He was a practicing physician, in the school of Tübingen, whence he was removed because of his publication of the doctrine that nothing beyond material force is known to man (published in English as *Force and Matter*). The main ideas of his doctrines are the eternity of matter, the indestructibility of force, the co-existence of light and life, and the infinity of forms of being. *Licht und Leben* was published, '82.

BUCHNER, MAX, explorer, b. in Hamburg, Germany, April 25, 1846; made his first expedition to Africa in 1878; aided in the annexation of Togoland and Kamerun to the German possessions in 1884; became curator of the ethnologic museum of Munich; and made an exploring journey to Australia and New Guinea in 1888-90.

BUCHTEL COLLEGE is situated in the city of Akron, Summit County, Ohio. It was founded by the Universalist State Convention of Ohio, and named in honor of John R. Buchtel, its most liberal benefactor. It was opened to students of both sexes Sept. 11, 1872. There are three four years' courses of study—the classical, the philosophical, and the scientific. All studies are elective after the first term of the sophomore year. There is also a preparatory course for each of the college courses, carried on by separate teachers. There are 50 perpetual scholarships of one thousand dollars each intended to aid worthy and deserving students. While under the control of a denomination its liberal spirit causes it to welcome students of all religious beliefs and, as a matter of fact, half its students are from various denominations other than Universalists. In 1897 it employed sixteen teachers and had enrolled two hundred students.

BUCHU. See **BUCKU**.

BUCK, a name sometimes distinctively appropriated to the male of the fallow deer (q. v.), the female of which is a *doe*. But the term B. is often also applied to the male of other species of deer, as of the roebuck, although never to that of the red deer (see **DEER**), which, when mature, is a **STAG** or a **HART**.

BUCK, DUDLEY, b. Hartford, Conn., 1839. A commercial career was chosen for him, but he early showed such aptitude for music that his father allowed him to leave college, 1858, in order to prosecute his musical studies at the Leipsic conservatory. Returning to the U. S., 1862, he soon became noted as a musical leader, composer, and organist. He furnished the music for Lanier's cantata, sung at the opening of the Centennial exhibition, Philadelphia, 1876, and gained the prize of \$1000, offered by the Cincinnati Musical festival of 1880 for the best cantata, choosing Longfellow's *Golden Legend* as his text. He published *The Story of the Cross*, a cantata, in 1891.

BUCKAU, a t. in Saxony on the Elbe, adjoining Magdeburg; pop. '85, 16,049. It has extensive machine works, and several important manufactories.

BUCKBEAN, or **MARSH TREFOIL** (*Menyanthes trifoliata*), a plant of the natural order *gentianaceæ* (q. v.), the only known species of its genus, widely distributed in all the colder parts of the northern hemisphere, and common in America. It has been described as "perhaps the most beautiful" of all British plants. It grows in marshy places, its creeping root-stalks (or rhizomes) and densely matted roots often rendering boggy ground firm. The leaves are ternate, like those of the trefoils or clovers, and are supported on pretty long stalks. The flower-stalk bears a compound raceme of 10 to 20 white flowers, externally tipped with red. The calyx is 5-parted; the corolla funnel-shaped, with a spreading 5-lobed limb, shaggy on the inner surface, with thick fleshy hairs. The fruit is a one-celled, two-valved capsule. The leaves are destitute of smell, but very bitter. From them is prepared a valuable bitter extract, which has long been used in cases of dyspepsia and disorders of the bowels, and which was also formerly employed in intermittent fevers. An infusion is also sometimes used, and sometimes the dried and powdered leaves. The whole plant seems to possess the same bitter and tonic properties. It is sometimes used in Germany as a substitute for hops. The root-stock, however, which is black and jointed, contains a considerable quantity of a kind of starch.

BUCKBOARD. A four-wheeled vehicle in which a long elastic board or platform is used in place of the ordinary body, springs, and gear. It is fixed as a connection between the fore and rear axles, and may have one or more seats. It is thus the most simply constructed of any four-wheeled vehicle. Buckboards were first used only in mountain districts where the roads are rugged, and were for a long time rudely and simply built. When the Adirondack region and Mount Desert became fashionable resorts, the summer visitors to these places had the primitive buckboards reproduced in

more elegant form by carriage builders, so that the buckboard now usually seen differs greatly from the model, being made in handsome woods of a light color, ash or hickory, with springs, silver mountings, and cushions of russet leather, and costing from \$100 to \$500.

BUCKEYE. See HORSE CHESTNUT.

BUCKEYE STATE. See STATES, POPULAR NAMES OF.

BUCK-HOUND, a hunting-dog once common in Britain, when buck-hunting was a most fashionable amusement, but of which few packs now exist. The buck-hound resembles a dwarf STAG-HOUND (q.v.), and possesses great strength and perseverance. Bucks are, however, often hunted by other kinds of hounds.

BUCKINGHAM, a co. in central Virginia on the James and Appomattox rivers, traversed by the James canal. Area, 628 sq.m.; pop. '90, 14,628, half colored. There is a gold mine near Willis mountain, and iron and slate are found. Co. seat, Buckingham.

BUCKINGHAM, the old co. t. of Buckinghamshire, in the n. part of the shire, is situated on the Ouse—which flows round the town, and has three bridges. B. is 61 m. n. w. of London by rail. Till 1885 it sent one member to parliament. Pop. '91, 3364. It was formerly an important seat of the bobbin lace manufacture, but this industry has declined. B. is a place of considerable antiquity. Edward the elder fortified it in 978, and the Danes captured it in 1010. The earls of Buckingham built a castle here soon after the Norman conquest. Edward III. made it a staple for wool. Here Catharine of Aragon received the news of the battle of Flodden, and Charles I. had his head-quarters in B. for a few days in 1644.

BUCKINGHAM, Duke of; **GEORGE VILLIERS**, the favorite of James I. and Charles I. of England, third son of sir George Villiers, was born at his father's seat of Brooksby, Leicestershire, Aug. 20, 1592. Knighted in April, 1616, and sworn a gentleman of the bed-chamber on Jan. 1, 1617, he became master of the horse and a knight of the garter. Created the same year baron of Whaddon and viscount Villiers, and in Jan. following earl of B., and sworn of the privy-council, he was next made a marquis, and appointed lord-admiral of England, chief-justice in Eyre of parks and forests s. of the Trent, master of the king's bench office, high steward of Westminster, and constable of Windsor castle. In 1620, he married the daughter of the earl of Rutland, the richest heiress in the kingdom. In 1623, while negotiations were in progress with the Spanish court for a marriage between the infanta and the prince of Wales, afterwards Charles I., B. persuaded the latter to go himself to Madrid and prosecute his suit in person. The ultimate failure of the negotiations has been ascribed to B.'s arrogance. In his absence he was created a duke, and on his return nominated lord-warden of the Cinque Ports, and steward of the manor of Hampton court. By his advice, James declared war against Spain. On the accession of Charles I., in 1625, B. maintained his ascendancy at court, but after the ill-fated expedition against Cadiz, he became odious to the nation, and was saved from impeachment only by the king's dissolving parliament. The treaty for the marriage of Charles with the princess Henrietta of France was concluded by him, but he was not allowed to return to Paris, in consequence of his audacity in lifting his eyes to the French queen. In 1627, with an armament of 100 sail and 7000 soldiers, he appeared before Rochelle, then in possession of the Huguenots, who refused him admission within the harbor. His troops then made an ill-conducted descent on the neighboring isle of Rhé, and returned to England beaten and disgraced. He soon after undertook a second expedition to Rochelle, and proceeded to Portsmouth for embarkation, when he was assassinated by a discontented subaltern-officer, named Felton, Aug. 23, 1628, in his 36th year.

BUCKINGHAM, 2d Duke of (**GEORGE VILLIERS**), a brilliant but profligate nobleman, son of the preceding, was b. at Wallingford house, Westminster, Jan. 30, 1627, and studied at Cambridge. On the outbreak of the civil wars, he served in the royal army; his estates were confiscated by the parliament, and he took refuge on the continent. He attended Charles II. into Scotland, and after the battle of Worcester, in 1651, went again into exile. Returning secretly into England, he married, in 1657, the daughter of lord Fairfax, the parliamentary general, to whom his forfeited estates had been assigned. Arrested by Cromwell, and committed to the Tower, he was afterwards removed to Windsor castle, but released on the abdication of Richard Cromwell. At the restoration, he recovered his estates, and was made master of the horse, and sworn of the privy-council. He was mainly instrumental in the fall of the chancellor, Clarendon, whom he made an object of ridicule to the king, and was one of Charles's confidential ministers, who, from the initial letters of their titles, were called "the Cabal." Engaging in 1666 in some treasonable practices for effecting a change in the government, he was deprived of all his offices at court, but, on his submission, soon recovered them. In 1670, he was sent ambassador to France, and was employed on some other embassies. He was elected chancellor of the university of Cambridge in 1671. Supporting the non-conformists in 1674, he opposed the test act, and was deeply engaged in the popish plot. After Charles's death, in 1685, B. retired to his manor of Helmsley, in Yorkshire, and amused himself with the chase. He died at Kirkby-Moorside, April 16, 1688, and was

- interred in Westminster abbey. The manufacture of glass and crystal is said to have been introduced into England from Venice by him. B. was the author of several stage-plays, of which the best is *The Rehearsal*, a comedy; *A Satire against Mankind*; and some poems.

BUCKINGHAM, JAMES SILK, an English traveler and popular lecturer, son of a farmer, b. in 1786, at Flushing, near Falmouth, Cornwall; when a boy, went to sea, and made several voyages to Lisbon. After years of unsettled and wandering life, he, in 1816, established a journal at Calcutta, but the boldness of his censures on the Indian government led to his expulsion from the presidency of Bengal. His lectures, on his return to England, against the East India company monopoly, and in support of opening the trade to China, tended greatly to direct public attention to the subject. In London, he established *The Oriental Herald*, and *The Athenæum*, now the leading weekly literary journal. Subsequently, he traveled through the United States, and from 1832 to 1837 was M.P. for Sheffield. He was projector and secretary of the British and foreign institute, literary club, 1843-1846; and president of the London Temperance League, 1851. B. was the author of numerous works of travel on the continent, in the east, and in America. He was engaged on his autobiography, two volumes of which were published before his death, which took place June 30, 1855.

BUCKINGHAM, JOSEPH TINKER, 1779-1861; an American journalist, native of Connecticut. He was bred a printer, and in 1800 went to Boston, where, six years later, he began *The Polyanthus*, a monthly magazine, which was soon suspended, but resumed in 1812. In 1809, he published a weekly called *The Ordeal*; from 1817 to 1828, *The New England Galaxy and Masonic Magazine*; and, in 1831, *The New England Magazine*. In 1824, he started the *Boston Courier*, of which he was editor until 1848. On the 24th of June, 1840, he presided over the celebration (in Boston) of the four hundredth anniversary of the invention of printing. As an editor he was a vigorous writer, but rather bitter and personal. He was several times elected to the legislature. Besides his ordinary work, he published *Specimens of Newspaper Literature, with Personal Memoirs, Anecdotes, and Reminiscences, and Personal Memoirs and Recollections of Editorial Life*.

BUCKINGHAM, WILLIAM ALFRED, LL.D., 1804-75; the "war governor" of Connecticut (1858-66), noted for his zeal and untiring energy in support of the union cause during the civil war. Before his election as governor he was a carpet manufacturer and merchant. In 1869 he was elected U. S. senator. Among his benefactions was \$25,000 to the Yale theological seminary. The capitol at Hartford has a statue of him.

BUCKINGHAM, OR BUCKINGHAMSHIRE, JOHN SHEFFIELD, Duke of; 1649-1721; son of the second earl of Mulgrave. In the war with Holland, he served in the navy and commanded a ship; and afterwards, in the land forces, he joined Turenne to study the art of war. James II. made him lord chamberlain and one of the privy council. He acquiesced in the revolution and was in the cabinet of William III.; and, on the accession of Anne, with whom he was a personal favorite, he received the privy seal and became lord lieutenant of the North Riding of Yorkshire. He sided with the tories, and held last the dignity of lord president. He wrote two tragedies, and an essay on poetry, and one on satire.

BUCKINGHAMSHIRE, a south-midland county of England, its greatest length being about 54 m., its average breadth 18, and total area 743 sq. miles. The plastic clay tertiary strata occupy the southern parts of the county, which is finely diversified with hill and dale, wood and water. To the n. is a broad chalk-band, including the Chiltern range of chalk-hills, which enter from Oxfordshire, and stretch across the county in a n.e. direction into Bedfordshire, partly covered with heath and wood, and near Ivinghoe and Wendover, above 900 ft. high. Sloping n. from these hills, and crossed by narrower bands of greensand and oolite, is the extensive and very fertile vale of Aylesbury, watered by the Thame. The chief rivers are the Thames, bordering the county on the s.w., the Ouse, Ousel, Colne, and Thame, the latter two falling into the Thames. The Grand Junction canal, and the Great Western and North-western railways, intersect the county on the e. and south. The climate of Bucks is mild and healthy; the soil is mostly good, chalk and clay predominating. About half the county is under tillage, the rest in meadows and pasture. The agriculture is not equal to the capabilities of the land, which is often overcropped and exhausted. The farms are generally small, averaging 200 acres. The cottages are generally good. Wheat and beans are the principal crops. The chief dairy product is butter, of which four to five millions of pounds are annually sold, chiefly in London. In the vale of Aylesbury, fattening of cattle is extensively carried on; the sheep are noted for their fine and heavy fleeces; and large numbers of ducks are reared for metropolitan consumption. In the northern portion there are still to be found woods of considerable extent. The beech and oak are the chief timber-trees, but box and juniper are also grown. The chief manufactures are paper, straw-plait, and thread-lace. B. returns 3 members to parliament—losing in 1885 as parliamentary boroughs, its chief towns, Aylesbury, Buckingham, Marlow, an Wycombe. B. contains some Roman and British remains, as traces of Watling, Ick neld, and Akeman streets or ways. The chief ecclesiastical ruins are those of Miss

enden and Notley abbey, the latter of which has been converted into farm-buildings. There are many examples of early English and decorated architecture. The church of Chetwode, near Buckingham (13th c.), contains some very fine examples of ancient glass-staining. Many events of historical interest occurred in this county. It was the scene of contest in the civil wars of Stephen and John. At Chalfont St. Giles, Milton finished his *Paradise Lost*, and at Horton, he wrote *L'Allegro*. At Hampden lived the great patriot of that name; Waller was proprietor of Beaconsfield manor; Atterbury was born at Milton; Stoke Poges churchyard suggested Gray's *Elegy*, and is the place of his burial; at Olney, Cowper lived; at Gregories, near Beaconsfield, Burke died and was buried; Scott, the Biblical commentator, was rector of Aston Sandford; Herschel's great telescope still stands at Slough, where he made most of his important discoveries; and at Stowe is a magnificent mansion—one of the finest in England, alike for extent, architecture, and beauty of site—formerly belonging to the duke of Buckingham. Pop. '71, 175,879; '81, 176,277; '91, 185,284.

BUCKLAND, CYRUS, b. Conn., 1799; a successful inventor, pattern-maker of the U. S. armory at Springfield, Mass., and designer of machinery for making arms. He produced many new machines and tools in the line of arms manufacturing. He d. 1891.

BUCKLAND, FRANCIS TREVELYAN, son of William Buckland, D.D. (q. v.), b. at Christ Church college, Oxford, Dec. 17, 1826. He was educated at Winchester school, and at Christ Church college, Oxford. He devoted himself to the study of medicine; and after being house-surgeon of St. George's hospital, London, was appointed assistant-surgeon to the 2d life-guards in 1854, retiring in 1863. From his boyhood, he manifested an enthusiastic delight in natural history, especially when it could be applied practically to the cultivation of useful quadrupeds, birds, or fish, in which study he was encouraged and guided by his father. He contributed a vast number of brief papers on various branches of his favorite science to the *Times*, *Field*, *Queen*, *Land and Water* (of which he was editor), etc. He was also the author of *Curiosities of Natural History* (Lond. 1857; second series, 1860; third series, 2 vols., 1866); of a work entitled *Fish-hatching* (Lond. 1863); and *Logbook of a Fisherman and Zoologist* (1876); and editor of a new edition of his father's Bridgewater treatise (Routledge, 1858); and of *White's Selborne* (1876). He was first secretary to the acclimatization society of Great Britain and Ireland. He was an acute observer, and his writings on subjects of natural history in great part exhibit the results of fresh and original observations, which his sprightly style exhibits in a most interesting manner. He had long taken a great interest in fish-culture, and had been actively concerned in the recent endeavors to promote it in England. He had, at his own cost, established under the science and art department, South Kensington, a "museum of economical fish-culture," illustrating the natural history of salmon and sea-fish by means of plaster-casts, which he made with his own hands, and by preparations and dissections in spirits. In 1867, B. was appointed inspector of salmon fisheries for England and Wales, in 1870, special commissioner on the salmon fisheries of Scotland, and in 1877 on the Scotch herring fisheries. He d. 1880. *Life* by Bompas, 1885.

BUCKLAND, WILLIAM, D.D., a distinguished geologist, whose labors tended greatly to the advancement of science, was born at Tiverton, Devonshire, England, in 1784. Educated at Winchester and Oxford, he was appointed, in 1813, reader in mineralogy in Oxford university. The same year, he was elected a fellow of the geological society, and he was twice its president. In 1818, he became reader in geology at Oxford, and was elected fellow of the royal society. In 1822, he received the Copley medal for an account of an assemblage of fossil teeth and bones of 22 different animals, discovered in a cave at Kirkdale, Yorkshire; and, in 1823, he published a treatise founded on it, entitled *Reliquiæ Diluvianæ, or Observations on Organic Remains, attesting the Action of a Universal Deluge*, a theory which he afterwards saw cause to modify. In 1825, B. was appointed a canon of Christ church, Oxford. In 1827, he was chosen a member of the council of the royal society; in 1832, he was elected president of the British association at Oxford, its second meeting; and, in 1836, he published his Bridgewater treatise, *Geology and Mineralogy Considered with Reference to Natural Theology* (2 vols. 8vo). To the transactions of the geological society he contributed many valuable papers; and his sketch of the structure of the Alps, in the *Annals of Philosophy*, is esteemed one of the most interesting of his geological writings. In 1845, he was made dean of Westminster, and, in 1847, a trustee of the British museum. Under his great and continuous labors to benefit others, his mental faculties gave way some years before his death, which took place Aug. 14, 1856.

BUCKLANDIA, a magnificent and beautiful evergreen tree of the natural order hamamelidæ (see WITCH-HAZEL), a native of the mountains. It grows unbranched to the height of 40 ft., the trunk sometimes 21 ft. in girth at 5 ft. from the ground. The foliage is thick, bright, and glossy. The timber is not valuable. Dr. Hooker thinks that this tree would probably succeed in the mild climate of the w. of England.

BUCKLE, HENRY THOMAS, an author who attained a sudden notability in 1857 by the publication of the first volume of a work entitled *The History of Civilization in England*. He was born at Lee, in Kent, Nov. 24, 1821, and was for a very short time at Dr. Holloway's school in Kentish-town, near London. No other school and no

university claims credit for his education, which, nevertheless, was in the highest degree liberal. An easy fortune and a large library enabled Mr. B. to gratify, without any sort of impediment or restraint, an all-absorbing love of letters. After bringing out a second volume of his work in 1861, he undertook a journey to the east, in order to restore his health and extend his knowledge. Having spent the winter in Egypt, he went over the desert to Syria, caught typhus fever by the way, and died at Damascus, May, 1862.

B.'s plan involved, before tracing the particular history of English civilization, a general consideration of the progress of those European countries, England, France, Germany, Scotland, Spain, and America, in which the elements of modern civilization are originally found. The two volumes published are occupied with this preliminary examination, which they do not even complete. His objects, however, are clear. They are (1) to discover what is the essential spirit of a nation's history apart from particular men and events, and (2) to trace out the causes of the progress which has been made in England and France. Under the first head B. endeavors to show that the spirit or character of a people is dependent on material circumstances, such as soil, climate, food, aspect of nature, and the like, and to be sought for in these; under the second head occurs the theory, the vigorous application of which by B. has startled and offended many readers—viz., that the progress of society depends upon skepticism; that the retarding force is credulity; and that the excessive "protection" exercised by governments, the nobility, the church, etc., over the "people," has dwarfed and held back the spirit of freedom and civilization. These and other positions are defended by B. with great ingenuity and lucidity of argument and expression, and have been admitted, even by his opponents, to contain much sound truth. He is accused—perhaps not unjustly—of being often one-sided, and of drawing sweeping deductions from an imperfect survey of the facts. He is said to have been one of the best chess-players in the world. See his *Miscellaneous and Posthumous Works*, last ed. by Grant Allen (1880); *Pilgrim Memories*, by J. S. Stuart Glennie; *Life*, by Huth (1880).

BUCKLER, in old armor, was a kind of shield worn on the left arm. The bucklers worn by the *hastati*, or spearmen, among the ancient Romans, were about 4 ft. long, by $2\frac{1}{2}$ in width, made of boards, covered on the inside with linen and sheepskin, and on the outside with iron plate. In the middle ages the B. was round, oval, or square in shape, and was frequently made of wicker-work or of hide, strengthened by metal-plates.

BUCKLES, metal instruments, consisting of a rim and tongue, used for fastening straps or bands in dress and harness. The use of B., instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds and other precious stones. In the latter half of last century the manufacture of B. was carried on most extensively in Birmingham, there being at one time not less than 4000 people employed in that town and its vicinity, who turned out 2,500,000 pairs of B. annually, at the average value of 2s. 6d. per pair. When the trade was at its height, however, fashion changed, and in 1791 we find buckle-makers petitioning the prince of Wales for sympathy, on the ground that the introduction of shoe-strings had nearly ruined their trade. The prince promised to assist them as far as he could, by wearing B. himself, and enjoining his household to do the same; but fashion was too strong even for him, and B. became almost extinct, except as a part of the English court dress.

BUCKLEY, JAMES MONROE, D.D., b. 1836, Rahway, N. J.; was educated at Pennington sem., and entered Wesleyan univ., but left college during the freshman year; studied theology in Exeter, N. H. In 1859 he joined the N. H. conf. of the M. E. church. He was stationed at Dover, Manchester, and Concord, 1859-63; Detroit, 1864-5; New York, 1866; Brooklyn, 1867-80. In 1872, 76, 80, Dr. B. was delegate to gen. conf.; in 1881, delegate to ecumenical Meth. conf., London. Since 1880 he has been the editor of the *Christian Advocate*. He edited *Hymn Book of M. E. Church*, 1876; was author of *Christians and the Theatre*, 1876; *Oats or Wild Oats*, 1885; *The Land of the Fear and the Nihilist*, 1886; *Faith Healing*, 1892; *Travels in Three Continents*, 1895, etc. He was active as member of the committee on judicial code for discipline, 1880.

BUCKMINSTER, JOSEPH, D.D., 1751-1812; an American Congregational clergyman, b. Mass. He graduated at Yale, studied theology, and was for a time tutor in the college. In 1779 he became pastor of the North church, Portsmouth, N. H., where he remained for a third of a century, retiring only by reason of failing health. He died soon afterwards, while on a visit to Vermont. Dr. B. took deep interest in the controversy that divided the Congregationalists. See *Memoirs* by Eliza B. Lee, 1851.

BUCKMINSTER, JOSEPH STEVENS, son of Rev. Joseph, 1784-1812. He was educated at Harvard, and was a teacher in Phillips Exeter academy, having Daniel Webster for one of his pupils. In 1804, he was made pastor of Brattle street church, Boston, one of the leading congregations in New England. In 1806-7, he traveled in Europe, taking a deep interest in the purchase of books for the Boston Athenæum. In 1808, he supervised the republication of *Griesbach's New Testament* (in Greek), and was soon afterwards appointed lecturer on biblical criticism at Cambridge. He was a member of most of the important literary societies of the day. His works have been published in

two volumes. While preparing for his biblical lectures in 1811, he had an attack of epilepsy which caused his death in 1812. See *Memoirs* by Eliza B. Lee, 1851.

BUCKNER, SIMON BOLIVAR, military officer, b. in Kentucky, April 1, 1823. He graduated at West Point in 1844; assistant professor there in 1846; served under Taylor and Scott in Mexico in 1846-8, and was wounded at Churubusco; resigned from the army in 1855; superintendent of construction of the Chicago custom-house; served in the Confederate army; surrendered Fort Donelson to Gen. Grant in 1862; subsequently a major-general; and was included in Kirby Smith's surrender in 1865. He was elected governor of Kentucky in 1887; and was the candidate of the National Democrats for vice-president of the United States in 1896.

BUCKS, a co. in e. Pennsylvania, on the New Jersey border, bounded by Delaware river; 610 sq.m.; pop. '70, 64,336; '90, 70,615. It possesses mines and quarries of iron, plumbago, zircon, limestone, and sandstone. Surface hilly but well cultivated. The Pennsylvania, and the Philadelphia and Reading railroads pass through. Productions, corn, oats, hay, potatoes, butter, tobacco, etc. Co. seat, Doylestown.

BUCKS. See BUCKINGHAMSHIRE.

BUCKSKIN, a term applied in England to a strong-twilled woolen fabric for trousers; in America, to deerskin or sheepskin made pliable by dressing it with oil or brains, and used in olden times for breeches, but now almost exclusively for gloves.

BUCKSPORT, a town in Hancock co., Me., on the Penobscot river and the Maine Central railroad; 18 m. s. of Bangor. It is a handsome town, regularly laid out on a gentle slope. At Prospect, on the river, is Fort Knox, commanding the narrows and the river both up and down. The principal industries are shipbuilding, fisheries, leather tanning, wood-working, and ice. The town has a United States salmon preserve, the Buck Memorial Library, the East Maine Conference Seminary. It was settled 1762; incorporated, 1792. Pop. '90, 2921.

BUCKSTONE, JOHN BALDWIN, a distinguished comedian and dramatic writer, was b. in the suburbs of London, in 1802. Preferring the excitement of the stage to the monotony of an attorney's office, he sought and soon found an opportunity in a provincial town for the display of his theatrical abilities. After a probation in the country, he appeared at the Surrey theater in 1823, and his success was so unequivocal, that he was soon engaged by the "management" of the Adelphi theater, where he continued for many years as leading low comedian. He afterwards played at the Haymarket and Drury Lane theaters, of the former of which he was lessee from 1853 to 1878. He died 31st Oct., 1879. B.'s acting was not more noted for its comicality and humor, which never degenerated into vulgarity, than for its distinct appreciation of the peculiar traits in each individual character he assumed. In all his delineations there was the same broad general effect, but the details of each were wrought out with great care and minuteness. B. was also a prolific dramatic author, and of the 150 pieces he is said to have written for the stage, several have been highly popular. Among the best known are *The Green Bushes*; *The Flowers of the Forest*; *Luke the Laborer*; *The Wreck Ashore*; *The Rough Diamond*; *Good for Nothing*; *the Irish Lion*; and *The Alarming Sacrifice*.

BUCKTHORN, *Rhamnus*, a genus of shrubs or small trees of the natural order *rhamnaceæ* (q.v.), distinguished by a bell-shaped 4 to 5-cleft calyx, which divides around the middle after flowering, the upper part falling away, and the base remaining and adhering to the fruit; which is globose, and sometimes succulent, sometimes rather dry or spongy, with 2 to 4 stones. The petals are sometimes wanting. Some of the species are dioecious, some hermaphrodite. They are numerous, and natives of most of the tropical and temperate regions of the world.—The COMMON BUCKTHORN (*R. catharticus*) is a deciduous shrub or low tree, frequent in England and in other parts of Europe and the n. of Asia. The leaves are ovate, crenate, and bright green; the branches spiny; the flowers small, yellowish-green, and densely clustered; male and female flowers on separate plants; the berries about the size of peas, globular, bluish-black, nauseous, and violently purgative. They were formerly much used in medicine, but now more rarely, and only in the form of a syrup prepared from their juice. They supply the *sax green* (q.v.) or bladder green of painters. The bark affords a beautiful yellow dye. The B. is sometimes planted for hedges, but is of too straggling a habit.—The ALDER BUCKTHORN, or BERRY-BEARING ALDER (*R. frangula*), is also a native of Britain, and is frequent in woods and thickets throughout Europe. It is a shrub, rarely a small tree, with spineless branches, oval entire leaves, and small, whitish, axillary flowers, which are in general somewhat clustered. The charcoal of the wood is light, and is used for the preparation of gunpowder. The bark, leaves, and berries are used for dyeing; the bark for dyeing yellow, and with preparations of iron, black; the unripe berries to dye wool green and yellow; the ripe berries to dye it bluish-gray, blue, and green. There are two native species in the U. S.—DYER'S BUCKTHORN (*R. infectiorius*), is a low shrub, abundant in the s. of Europe, whose unripe fruit yields a brilliant yellow dye. The berries and inner bark of *R. tinctorius*, a native of Hungary, are also used in dyeing; and the berries of *R. saxatilis*, a procumbent shrub, growing amongst rocks as far

n. as Switzerland. The *French berries*, *Avignon berries*, or *yellow berries* of dyers, are the fruit of *R. infectorius*, *R. saxatilis*, *R. amygdalina* (or *oleoides*), and *R. Chusii*.—The SEA BUCKTHORN is a shrub of a different genus and order. See SALLOW-THORN.

BUCKU, a name common to several small shrubs of the genus *barosma* (formerly included in *diosma*), natives of the Cape of Good Hope, the leaves of which are used in medicine—sometimes in the form of a powder, more generally of an infusion or a tincture—particularly on account of their powerful operation on the urinary organs, as in chronic inflammation of the bladder, urinary calculus, etc. They are also used in dyspepsia, rheumatism, and dropsy; and are stimulant and antispasmodic, diuretic, diaphoretic, and tonic. They generally appear in commerce mixed with stalks and fruit. They are smooth, leathery, and shining, more or less crenated, or serrated, and are much covered with pellucid dots, which are glands filled with a strongly smelling yellowish volatile oil. The strong odor of *B.* leaves is generally regarded as disagreeable, but the Hottentots perfume themselves with them. They have a warm taste, resembling that of mint.—The genus *barosma* belongs to the natural order *rutaceæ*, and is distinguished by regular flowers with 5 petals, 5 fertile and 5 abortive scale-like stamens, anthers bearing a minute terminal gland, and a 5-lobed ovary. The species principally yielding the *B.* leaves of the shops are *B. serratifolia*, *B. crenata*, *B. crenulata*, and *B. venusta*.

BUCKWHEAT, *fagopyrum*, a genus of plants of the natural order *polygonæ* (q.v.), or, according to many botanists, a subgenus of *polygonum*, distinguished by the central embryo, and by racemes of flowers grouped in panicles. Common *B. (fagopyrum esculentum, or polygonum fagopyrum)* is a native of the basin of the Volga, the shores of the Caspian sea, and many parts of central Asia, from which it is said to have been introduced by the Moors into Spain, and thence to have extended over Europe, in many parts of which, and in some places in Britain, it is now naturalized. Another account represents it as having been brought to Europe by the crusaders. In France, it is called *blé Sarrasin*, or *Saracen wheat*. It is cultivated on account of the farinaceous albumen of its seeds, which are used, as grain, for food of man and cattle. It is upright, branched, 1 to 3 ft. in height; the leaves are between heart-shaped and arrow-shaped, the flowers pale red, the seed (nut) black and triangular, the angles even (not toothed). The resemblance of this seed in form to the beech-nut is supposed to be the reason of the German name *buchweizen* (beech-wheat), from which the English name is derived. *B.* is a very common crop in some parts of Europe, and of the United States of North America; but is seldom sown in Britain, except as food for pheasants. It requires continued dry weather in autumn for profitable harvesting, and this in the climate of Britain cannot well be reckoned on. In Germany, *B.* is much valued as a crop, particularly for moorlands and other poor soils. In Bretagne, also, it is as extensively cultivated as wheat. It yields very abundantly, and requires little attention and little manure. Forty bushels or more per acre may be expected, weighing 46 or 48 lbs. per bushel; and notwithstanding the resemblance of the seed to grain in its qualities and uses, wheat, or any other cereal crop, generally succeeds well after *B.*, if care has been taken to keep the land clear by tilling. The seed is most frequently used in the shape of groats, or made into pottage, and in the United States thin cakes are very often made of it. It is very nutritious, containing about 10 per cent of gluten and 52 per cent of starch, besides about 6 per cent of gum and sugar. It is said to be as good as barley for fattening cattle, and better for horses than oats. But as the seed is covered with a very hard rind or thin shell, it must always be shelled before being given to cattle. Poultry are very fond of it. Beer is sometimes brewed from it, and it yields a spirituous liquor of good quality; indeed, it is frequently used in gin-distilleries. As green fodder, the herbage of the plant is said to be more nutritious than clover; but it acts as a narcotic on sheep. Bees delight in its flowers, and in some parts of the United States it is sown on this account. In America the seed is usually sown broadcast over the land which has been plowed in autumn or early spring and well scarified or harrowed. About a bushel and a half of seed is required when sown broadcast, but a bushel is sufficient if drilled with a machine. In the latter case it should not be sown in narrower drills than one foot apart, but 2 ft. is recommended as being better for the succeeding crop, as the wider intervals can be properly cultivated. It should not be sown in England before the middle of May, as the least frost is injurious. When the lower seeds are ripe it should be mown, as they are easily shed out if allowed to stand too long. When bread made from *B.* forms the principal food of the people, it is thought to have an injurious action on the brain. As a supplementary article, however, it is a favorite among all classes where it is raised.—**TARTARIAN B.** (*F.* or *P. Tataricum*) is distinguished by the toothed edges of the seeds and its more vigorous growth. It is hardy, and adapted for cold situations. It is a native of Siberia. It is very productive, but the seed falls out when ripe more readily than that of the common species; and the flour is darker colored, and somewhat bitter.—**NOTCH-SEEDED B.** (*F.* or *P. emarginatum*) is said to be a native of China. Its seeds are larger than those of common *B.*, and their angles are winged. When grown in Britain, many of its flowers are generally abortive.—**PERENNIAL B.** (*F.* or *P. cymosum*) is a native of Nepaul, very vigorous in its growth, but producing, at least in Britain, comparatively little seed.—The triangular black seed of climbing *B.* or blackbine (*F.* or *P. convolvulus*), familiar to every one who has eaten oatmeal cakes or porridge, greatly resembles *B.*, but

is smaller. The plant—a very common weed in gardens and cornfields in Britain—also exhibits much similarity, notwithstanding its different habit and twining stem.—DYER'S B. is *Polygonum tinctorium*. See POLYGONEE.

BUCKWHEAT TREE, *Cliftonia ligustrina*, an evergreen shrub in the gulf states, of the order cyrtaceae, bearing fragrant white blossoms. It grows around ponds and streams, and gets its name from the shape of its pendulous fruit. Its local name is "titi."

BUCOLIC, a term derived from the Greek, meaning "belonging to herdsmen," and equivalent to the Latin term *pastoral*. See PASTORAL POETRY.

BUCYRUS, a city and co. seat of Crawford co., Ohio; on the Sandusky river and the Columbus, Sandusky and Hocking, the Ohio Central and the Pennsylvania Co.'s railroads; 62 miles n. of Columbus. It is in an agricultural region, with numerous mineral springs; contains railroad shops and machinery, furniture, and other manufactures; and has a public school library, high school, national banks, electric lights, and daily and weekly newspapers. Pop. '90, 5974.

BUCZACZ, a t. of the Austrian empire, in Galicia, 30 m. e.n.e. of Stanislawow, on the Stripa, a considerable affluent of the Dniester. A treaty of peace between the Poles and the Turks was signed here in 1672. Pop. '90, 10,096.

BUD, *Gemma*, in botany, that part of a plant which contains the rudiments of leaves or flowers prior to their development. Buds are distinguished into *leaf-buds* and *flower-buds*, the former producing leaves, and having a power of extension into a branch; the latter producing flowers only, and ordinarily destitute of this power of extension. The different parts of the flower being regarded, however, as *leaf-organs* or altered leaves (see FLOWER), the flower-bud may be regarded as merely a modified leaf-bud; and it is well known that, by treatment which checks the luxuriant growth of a plant, it may be caused to produce flower-buds where only leaf-buds could otherwise have been expected to appear—a physiological fact, of which advantage is taken in various ways by gardeners, as by removing portions of the bark and even of the woody part of the stem, root-pruning, confining the roots in a flower-pot, etc. Buds usually appear in the axils of leaves, the terminal bud of a branch being no exception to this rule; and there is no leaf without one or more buds in its axil, although many never pass beyond the most rudimentary state. See BRANCH. In cold and temperate climates, buds are formed about midsummer, beginning to appear as soon as the young branch which bears them has itself been properly developed, and are generally covered with scales and often also coated with resinous matter, by which their tender contents are protected from the severity of winter; but in the trees of warm climates, the protection of scales is generally wanting. Within the leaf-bud, the future leaves may be discovered, often very curiously folded or rolled up, and the different forms and positions which the leaves assume in the bud, are very characteristic of different kinds of plants. This is called the *vernation* (q.v.) of leaves, and is analogous to the *aestivation* (q.v.) of flowers. The buds of exogenous plants originate in cellular prolongations of the medullary rays bursting through the bark; those of endogenous plants are in communication with the cellular matter which lies between the bundles of woody tissue in the stem; and buds elongate into branches by the addition of new cellular matter to the extremity. Leaf-buds are capable of subsisting when separated from the parent plant and placed in favorable situations, developing themselves into new plants with the most exact correspondence in their characteristics to the parent plant; and of this gardeners avail themselves in the process of *budding* (q.v.), and in various ways for the propagation of plants. Some plants propagate themselves by a natural detachment of buds (*bulbils* or *bulblets*), modified into a character analogous to that of *bulbs* (q.v.); and bulbils themselves may indeed be regarded as subterranean leaf-buds with thickened scales. The *eyes* of the potato are also subterranean leaf-buds, the tuber being regarded as a thickened subterranean stem; and all plants with subterranean stems produce subterranean leaf-buds, sending above ground only herbaceous annual shoots, as asparagus, the banana, etc. Buds may be produced in exogenous plants from the extremity of any medullary ray, and may be made to spring from a leafless part of the stem by an incision, the effect of which is to direct a greater supply of sap to the part immediately beneath it. In a few plants, buds are produced on the edges, or even on the surface of leaves. In consequence of their power of independent existence, buds have been looked upon by some physiologists as distinct organized beings congregated in the tree or plant, a view which involves exaggeration, and therefore error.—Flower-buds cannot be used for budding, or otherwise for propagation of the plant, but when removed from their original stock, always die. See POLYPI; REPRODUCTION; and ZOOPHYTES.

BUDA (Slavonic, *Bu'din*; German, *O'fen*), a city of Hungary, forming with Pesth (with which it is united by a magnificent suspension-bridge) the capital of the country, is situated on the right bank of the Danube about 130 m. s.e. of Vienna, in lat. 47° 29' n., and long. 19° 3' east. B. has a highly picturesque appearance, being built round the Schlossberg (Castle-hill) in the form of an amphitheater, in the midst of a district covered with vineyards. Crowning this center hill or rock, which has an elevation of 485 ft. above the sea, is the citadel; the palace in which are preserved the royal insignia of

Hungary; and an old Gothic church. Behind, and towering above the rock, rises the Blocksberg, strongly fortified, with a precipitous face to the Danube, the slopes of the other sides being occupied with houses. B. has many educational and charitable institutions; and a fine observatory crowns the Blocksberg. It has some celebrated hot sulphur springs, with a temperature of $117^{\circ} 5' \text{ F.}$, from which it derives its German name, Ofen (Oven). It is the seat of the largest university in Hungary, and of many important manufactories, especially flour mills, tobacco factories, sugar refineries, chemical works and machine shops. Near by are produced the famous Ofner wines. Between 1870 and 1890 its growth has been remarkable. It is the commercial and literary centre of Hungary, and the residence, for part of the time, of the Emperor and his court. The Imperial Parliament meets here and at Vienna in alternate years. B. is a place of great antiquity, but its importance dates from 1240, when the fortress was erected on the Schlossberg. During the inroads of the Turks, it was regarded as the key of Christendom. It was captured by Solymán the magnificent in 1526, but retaken in the following year by Ferdinand I., king of Bohemia. In 1541, it was again taken by Solymán, who introduced into it a garrison of 12,000 janizaries; and it remained in possession of the Turks until 1686, when it was captured by the duke of Lorraine. B. and Pesth (q.v.) were in 1873 incorporated with one another, the official name being the compound *Budapest*. Pop. '90, 506,384.

BUDÆUS (the Latinized form of *Guillaume Budé*), one of the greatest French scholars of his age, was b. in Paris in 1467. He studied there and at Orléans. His works on philology, philosophy, and jurisprudence display extensive learning, but the two best known are the *De Asse et Partibus ejus* (Paris, 1514), which contains a very thorough investigation into ancient coins; and the *Commentarii Linguae Græcæ* (Paris, 1519), which greatly advanced the study of Greek literature in France, and is still held in high estimation by classical scholars. B.'s knowledge of Greek was particularly good. His style both in Latin and French is nervous, but harsh, and abounds in Greek constructions. His abilities were manifested not only in literature, but in public business. Louis XII. twice sent him to Rome as ambassador; and Francis I. also employed him in several negotiations. At B.'s suggestion, Francis founded the *Collège de France*, and was also persuaded to refrain from prohibiting printing, which the bigoted Sorbonne had advised in 1533. During his life, B. held several important offices. He was royal librarian, maître des requêtes, and provost of Paris. He died 23d Aug., 1540. A collected edition of his works appeared at Basel in 1557. B. was suspected of a leaning towards Calvinism. Certain circumstances render this highly probable. In his correspondence with his friend Erasmus, he repeatedly expresses his contempt for monks and ignorant ecclesiastics, and on one occasion terms the doctors of the Sorbonne "prating sophists." Besides, what is perhaps even more conclusive, shortly after his death, his widow and several members of his family went to Geneva, and openly abjured Catholicism. See his *Life* (1884) and *Lettres inédites* (1887), by E. de Budé.

BUDAON', BUDAUN, or BUDAYOON, a t. of India, 140 m. n.w. of Lucknow, giving its name to a British district of the Rohilkund division of the lieutenant-governorship of the n.w. provinces. It is situated in $28^{\circ} 2' \text{ n. lat.}$, and $79^{\circ} 11' \text{ e. long.}$ Its pop. was officially ascertained in 1891 to amount to 35,400. It was occupied by the mutineers and a body of liberated prisoners from Bareilly, June 1, 1857. The Europeans escaped by flight. It was captured by gen. Whitelock, April 19, 1858, and the rebels in this quarter were soon afterwards entirely subdued.—The district of Budaon contains an area of 2017 sq. m., and a pop. (1891) of 926,000, of which nearly six-sevenths are Hindus, and the remainder mostly Mussulmans. The district is a level, fertile tract on the Ganges and tributaries of it, of which the chief is the Ramgunga.

BUDDEUS, JOHANN FRANZ, 1667–1729; a learned Lutheran divine, b. in Pomerania. At Wittenberg he won distinction in languages, theology, and history; was Greek and Latin professor at Coburg, professor of ethical sciences and politics in the university of Halle, and in 1705 professor of divinity at Jena. He produced an historical German dictionary, an ecclesiastical history of the Old Testament, a work on practical philosophy, one on laws, and a universal theological history.

BUD DHISM—BUDDHA. The religion known as Buddhism from the title of "The Buddha," meaning "the wise," "the enlightened," acquired by its founder) has existed now for 2460 years, and may be said to be the prevailing religion of the world. In Hindustan, the land of its birth, it has now little hold, except among the Nepaulese and some other northern tribes; but it bears full sway in Ceylon, and over the whole eastern peninsula; it divides the adherence of the Chinese with the systems of Confucius and Lao-tse, claiming perhaps two thirds of the population; it prevails also in Japan (although not the established religion); and, n. of the Himalayas, it is the religion of Thibet (where it assumes the form of Lamaism), and of the Mongolian population of central Asia, and extends to the very n. of Siberia, and even into Swedish Lapland. Its adherents are estimated at 400 millions—more than a third of the human race. Yet, till near the middle of this century, nothing was known in Europe respecting the nature and origin of this world-religion, beyond the vaguest notices and conjectures. About the year 1828, Mr. B. H. Hodgson, British resident at the court of Nepaul, where Buddhism prevails, discovered the existence of a large set of writings in the Sanscrit language, forming the national canonical books. These books have since been found to be the

texts from which the Buddhist Scriptures of Thibet, Mongolia, and China must have been translated. The books of the Ceylon Buddhists are in the language called Pali; and though not translations of the Nepaulese standards, they are found to agree with them in substance, and to be only another and somewhat later version of the same traditions. Translations from the Ceylon standards are used by the Buddhists of Burmah and Siam. Copies of the Sanscrit books of Nepaul, having been sent by Mr. Hodgson to the Asiatic societies of London and Paris, engaged the attention of the eminent oriental scholar, Eugène Burnouf, who published in 1844 his *Introduction to the History of Buddhism*; and this book may be said to have been the beginning of anything like correct information on the subject among the western nations.

The most diverse opinions had previously prevailed as to the time and place of the origin of Buddhism. Some looked upon it as a relic of what had been the original religion of Hindustan, before Brahmanism intruded and drove it out; a relic of a widespread primeval worship, whose ramifications it was endeavored to trace by identifying Buddha with the Woden of the Scandinavians, the Thoth or Hermes of the ancient Egyptians, and other mythological personages. Others held that it could not be older than Christianity, and must have originated in a blundering attempt to copy that religion—so striking are the many points of resemblance that present themselves. Although the means are still wanting of giving a circumstantial history of Buddhism, the main outline is no longer doubtful. Oriental scholars now concur in fixing the date of its origin about the beginning of the 6th c. B.C., and in making it spring up in the N. of Hindustan. According to the Buddhist books, the founder of the religion was a prince of the name of Siddhartha, son of Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oude and Nepaul. He is often called Sakya, which was the name of the family, and also Gautama, the name of the great "Solar" race of which the family was a branch. The name Sakya often becomes Sakya-muni (*muni*, in San., means "solitary," and is allied to Gr. *monos*, the root of "monk"), in allusion to the solitary habits assumed by the prince. To Gautama is frequently prefixed *Sramana*, meaning *ascetic*. Of the names, or rather titles, given to Siddhartha in his state of perfection, the most important is the *Buddha*,* which is from the root *buddh*, to know, and, according to Wilson, means properly, "he to whom truth is known:" it is indicative of the leading doctrine of his system. Others are "The blessed" (*Bhagavat*); "the venerable of the world;" "the Bodhisatva," the import of which will be afterwards explained. The history of this person is overlaid with a mass of extravagant and incredible legend; and at least one eminent orientalist, Prof. H. H. Wilson, thinks it still doubtful whether the Buddha was an actual historical personage, and not rather an allegorical figment. Agreeing that the doctrine was introduced about the time assigned, he thinks it more likely that it originated with a school formed of persons of various castes, comprising even Brahmans. But by oriental authorities generally, the Buddha is received as the actual personal founder of the religion that goes by his name.

Assuming that the Buddha was a real person, and that there is a basis of fact under the mass of extravagant fable with which he is surrounded, the history of Buddhism may be thus briefly outlined: The prince Siddhartha gives early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya (see INDIA AND CASTE) and ruler, and take to a religious life, has him early married to a charming princess, and surrounded with all the splendor and dissipation of a luxurious court. Twelve years spent in this environment only deepen the conviction, that all that life can offer is vanity and vexation of spirit. He is constantly brooding over the thought that old age, withered and joyless, is fast approaching; that loathsome or racking sickness may at any moment seize him; that death will at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and sufferings. These images hang like Damocles' sword over every proposed feast of pleasure, and make enjoyment impossible. He therefore resolves to try whether a life of austerity will not lead to peace; and, although his father seeks to detain him by setting guards on every outlet of the palace, he escapes, and begins the life of a religious mendicant, being now about 30 years old. To mark his breaking off all secular ties, he cuts off the long locks that were a sign of his high caste; and as the shortened hair turned upwards, he is always represented in figures with curly hair, which induced early European writers to consider him as of Ethiopian origin. He commences by studying all that the Brahmans can teach him, but finds their doctrine unsatisfactory. Six years of rigorous asceticism are equally vain; and resolving to return to a more genial life, he is deserted by his five disciples, and then undergoes a fierce temptation from the demon of wickedness. But no discouragement or opposition can divert Sakya-muni from the search after deliverance. He will conquer the secret by sheer force of thinking. He sits for weeks plunged in abstraction, revolving the causes

* There is a confusing variety in the modes in which this name is spelled by European writers. S. Hardy, in his *Manual of Buddhism*, gives more than fifty forms that have come under his notice. Some of the more common are Bud, Bod, But, Budh, Boodh, Bhood, Budo, Buddow, Boutta, Poeta, Poth, Pot. The Chinese, owing to the meagerness of their articulations, seem to have been unable to come nearer to the real sound than Fo, Foe, or Fohi; from the same cause, they convert Brahma into Fan.

of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore, the cause of these evils is birth. But whence comes birth or continued existence? Through a long concatenation of intermediate causes, he arrives at the conclusion that ignorance is the ultimate cause of existence; and therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive stages of contemplation, he realizes this in his own person, and attains the perfect wisdom of the Buddha. The scene of this final triumph received the name of Bodhimanda (the seat of intelligence), and the tree under which he sat was called Bodhidruma (the tree of intelligence), whence bo-tree. The Buddhists believe the spot to be the center of the earth. Twelve hundred years after the Buddha's death, Hiouen-Thsang, the Chinese pilgrim, found the Bodhidruma—or a tree that passed for it—still standing. Although the religion of Buddha is extinct in the neighborhood, there are, about 5 m. from Gaya Proper, in Bahar, extensive ruins and an old dagoba, or a temple, which are believed to mark the place. Near the temple there flourished, in 1812, a peepul-tree, apparently 100 years old, which may have been planted in the place of the original bo-tree.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes are to be counteracted, the Buddha was now ready to lead others on the road to salvation. It was at Benares that he first preached, or, in the consecrated phrase, “turned the wheel of the law;”* but the most important of his early converts was Bimbisara, the sovereign of Magadha (Bahar), whose dynasty continued for many centuries to patronize the new faith. During the forty years that he continued to preach his strange gospel, he appears to have traversed a great part of northern India, combating the Brahmans, and everywhere making numerous converts. He died at Kusinagara (in Oude), at the age of 80, in the year 543 B.C.; and his body being burned, the relics were distributed among a number of contending claimants, and monumental tumuli were erected to preserve them. See TOPES.

The most important point in the history of Buddhism, after the death of its founder, is that of the three councils which fixed the canon of the sacred scriptures and the discipline of the church. The Buddha had written nothing himself; but his chief followers, assembled in council immediately after his death, proceeded to reduce his teaching to writing. These canonical writings are divided into three classes, forming the tripitaka or “triple basket.” The first class consist of the *soutras*, or discourses of the Buddha; the second contains the *vinaya*, or discipline; and the third the *abhidharma*, or metaphysic. The first is evidently the fundamental text out of which all the subsequent writings have been elaborated. The other two councils probably revised and expanded the writings agreed upon at the first, adding voluminous commentaries; as to the dates of the other two councils, there are irreconcilable discrepancies in the accounts; but at all events the third was not later than 240 B.C., so that the Buddhist canonical scriptures, as they now exist, were fixed two centuries and a half before the Christian era. The Buddhist religion early manifested a zealous missionary spirit; and princes and even princesses became devoted propagandists. A prince of the royal house of Magadha, Mahindo, carried the faith to Ceylon, 307 B.C. The Chinese annals speak of a Buddhist missionary as early as 217 B.C.; and the doctrine made such progress, that in 65 A.D. it was acknowledged by the Chinese emperor as a third state religion. The Chinese Buddhists have always looked on India as their “holy land;” and, beginning with the 4th c. of our era, a stream of Buddhist pilgrims continued to flow from China to India during six centuries. Several of these pilgrims have left accounts of their travels, which throw a light on the course of Buddhism in India, and on the internal state of the country in general, that is looked for in vain in the literature of India itself. See HIOUEN-THSANG. As to the spread of Buddhism n. of the Himalayan mountains, we have the historical fact, that a Chinese general, having about the year 120 B.C. defeated the barbarous tribes to the n. of the desert of Gobi, brought back as a trophy a golden statue of the Buddha.

A prominent name in the history of Buddhism is that of Asoka, king of Magadha, in the 3d c. of our era, whose sway seems to have extended over the whole peninsula of Hindustan, and even over Ceylon. This prince was to Buddhism what Constantine was to Christianity. He was at first a persecutor of the faith, but being converted—by a miracle, according to the legend—he became its zealous propagator. Not, however, as princes usually promote their creed; for it is a distinguishing characteristic of Buddhism, that it has never employed force, hardly even to resist aggression. Asoka showed his zeal by building and endowing viharas or monasteries, and raising topes and other monuments over the relics of Buddha and in spots remarkable as the scenes of his labors. Hiouen-Thsang, in the 7th c. of our era, found topes attributed to Asoka from the foot of the Hindu Kush to the extremity of the peninsula. There exist, also, in different parts of India, edicts inscribed on rocks and pillars inculcating the doctrines of Buddha. The edicts are in the name of king Piyadasi; but orientalists are almost unanimous in hold-

* From a too literal understanding of this phrase have arisen, probably, those praying-wheels, or rather wheels for meditation, seen standing before Buddhist monasteries in Tibet and elsewhere. The doctrines of Buddha are inscribed on the wheel, which is then set in motion by a windlass, or even by horse-power. The individual monks have portable ones, with which they perform their devotions wherever they may happen to be.

ing Piyadasi and Asoka to be one and the same. Not a single building or sculptured stone has been discovered in continental India of earlier date than the reign of this monarch, whose death is assigned to 236 B.C. A remarkable spirit of charity and toleration runs through these royal sermons. The "king beloved of the gods" desires to see the ascetics of all creeds living in all places, for they all teach the essential rules of conduct. "A man ought to honor his own faith only; but he should never abuse the faith of others. . . . There are even circumstances where the religion of others ought to be honored, and in acting thus, a man fortifies his own faith, and assists the faith of others."

For the glimpses we get of the state of Buddhism in India, we are indebted chiefly to the accounts of Chinese pilgrims. Fa-hian, at the end of the 4th c., found some appearances of decline in the e. of Hindustan, its birthplace, but it was still strong in the Punjab and the north. In Ceylon, it was flourishing in full vigor, the ascetics or monks numbering from 50,000 to 60,000. In the 7th c.—that is, 1200 years after the death of the Buddha—Hiouen-Thsang represents it as widely dominant and flourishing, and patronized by powerful rajahs. Its history was doubtless more or less checkered. The Brahmans, though little less tolerant than the followers of Buddha, seem to have been in some cases roused into active opposition; and some princes employed persecution to put down the new faith.

It was probably during the first four or five centuries of our era, and as a result of persecution, that Buddhists, driven from the great cities, retired among the hills of the west, and there constructed those cave-temple which, for their number, vastness, and elaborate structure, continue to excite the wonder of all who see them. There are reckoned to be not fewer than 900 Buddhist excavations still extant in India, nearly all within the presidency of Bombay. How the destruction of the Buddhist faith in Hindustan came about—whether from internal corruption, or the persecution of powerful princes, adherents of the old faith—we are utterly in the dark. But it is certain that from the time of Hiouen-Thsang's visit, its decay must have been rapid beyond precedent; for about the 11th or 12th c., the last traces of it disappear from the Indian peninsula.

What, then, is the nature of this faith, which has been for so long, and is still, the sole light of so many millions of human beings? In answering this question, we must confine ourselves here to a brief outline of the intellectual theory on which the system is based, and of the general character of its morality and ritual observances, as they were conceived by the founder and his more immediate followers; referring for the various forms which the external observances have assumed to the several countries where it is believed and practiced. See BURMAH, CEYLON, CHINA, JAPAN, LAMAISM.

Buddhism is based on the same views of human existence, and the same philosophy of things in general, that prevailed among the Brahmans. It accepts without questioning, and in its most exaggerated form, the doctrine of the transmigration of souls, which lies at the root of so much that is strange in the eastern character. For a particular account of this important doctrine or notion, which seems ingrained in the constitution of eastern minds, and without a knowledge of which no phase of thought or feeling among them can be understood, the reader is referred to TRANSMIGRATION; while the peculiar cosmogony or system of the universe with which it is associated, and which is substantially the same among Hindus and Buddhists, will be described under INDIA. It is sufficient here to say, that, according to Buddhist belief, when a man dies, he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of being composing the Buddhist universe—from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the 136 Buddhist hells, situated in the interior of the earth. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being 10 millions of years, the longer terms being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth either in an exalted and happy position on earth, or as a blessed spirit, or even divinity, in one of the many heavens; in which the least duration of life is about 10 billions of years. But however long the life, whether of misery or of bliss, it has an end, and at its close the individual must be born again, and may again be either happy or miserable—either a god or, it may be, the vilest inanimate object.* The Buddha himself, before his last birth as Sakyamuni, had gone through every conceivable form of existence on the earth, in the air, and in the water, in hell and in heaven, and had filled every condition in human life. When he attained the perfect knowledge of the Buddha, he was able to recall all these existences; and a great part of the Buddhist legendary literature is taken up in narrating his exploits when he lived as an elephant, as a bird, as a stag, and so forth.

The Buddhist conception of the way in which the quality of actions—which is expressed in Pali by the word *karma*, including both merit and demerit—determines

* One legend makes Bhagavat, in order to impress upon the monks of a monastery the importance of their duties, point to a besom, and, by his supernatural insight, reveal to them that it had once been a novice, who had been negligent in sweeping the hall of assembly; the walls and pillars, again, he told them, had once existed as monks, who soiled the walls of the hall by spitting upon them.

the future condition of all sentient beings, is peculiar. They do not conceive any god or gods as being pleased or displeased by the actions, and as assigning the actors their future condition by way of punishment or of reward. The very idea of a god, as creating or in any way ruling the world, is utterly absent in the Buddhist system. God is not so much as denied; he is simply not known. Contrary to the opinion once confidently and generally held, that a nation of atheists never existed, it is no longer to be disputed that the numerous Buddhist nations are essentially atheist; for they know no beings with greater supernatural power than any man is supposed capable of attaining to by virtue, austerly, and science; and a remarkable indication of this startling fact is to be seen in the circumstance that some at least of the Buddhist nations—the Chinese, Mongols, and Thibetans—have no word in their languages to express the notion of God. The future condition of the Buddhist, then, is not assigned him by the Ruler of the universe; the “karma” of his actions determines it by a sort of virtue inherent in the nature of things—by the blind and unconscious concatenation of cause and effect. But the laws by which consequences are regulated seem dark, and even capricious. A bad action may lie dormant, as it were, for many existences; the taint, however, is there, and will some time or other break out. A Buddhist is thus never at a loss to account for any calamity that may befall himself or others.

Another basis of Buddhism is the assumption that human existence is on the whole miserable, and a curse rather than a blessing. This notion, or rather feeling, is, like transmigration, common to Buddhism and Brahmanism, and is even more prominent in Buddhism than in the old faith. It is difficult for a European to conceive this state of mind, or to believe that it can be habitual in a whole people; and many signal errors in dealing with the Indian nations have arisen from overlooking the fact. The cause would seem to lie chiefly in the comparatively feeble physical organization of easterns in general. With a vigorous animal vitality, there is a massive enjoyment in mere bodily existence sufficient to drown a large amount of irritation and suffering, leaving life still sweet and desirable; while the spontaneous activity attending this vigor, makes it a pleasure instead of a pain to contend with and conquer difficulties. The Indian, on the contrary, even when he looks robust, has little intensity of animal vitality; and therefore, bodily existence, in itself, has to him little relish. Tedium of life, it is well known, arises more from negative than positive sources; and it requires but little bitter added to make his cup disgusting. So far, again, from finding activity a source of enjoyment, exertion is painful, and entire quiescence is, in his eyes, the highest state of conceivable enjoyment. When to this we add that want of security and peace, and that habitual oppression of the many by the few, with all the attendant degradation and positive suffering, which may be considered the normal state of things in the east, need we wonder that to men so constituted and so circumstanced, life should seem a burden, a thing rather to be feared than otherwise? The little value that Hindus set upon their lives is manifested in many ways. The punishment of death, again, has little or no terror for them, and is even sometimes coveted as an honor. For, in addition to the little value of their present existence, they have the most undoubting assurance that their soul, if dislodged from its present tenement, will forthwith find another, with a chance, at least, of its being a better one.

In the eyes, then, of Sakya-muni and his followers, sentient existence was hopelessly miserable. Misery was not a mere taint in it, the removal of which would make it happy; misery was its very essence. Death was no escape from this inevitable lot; for, according to the doctrine of transmigration, death was only a passage into some other form of existence equally doomed. Even the heaven and the state of godhead which form part of the cycle of changes in this system, were not final; and this thought poisoned what happiness they might be capable of yielding. Brahman philosophers had sought escape from this endless cycle of unsatisfying changes, by making the individual soul be absorbed in the universal spirit (Brahm); Gautama had the same object in view—viz., exemption from being born again; but he had not the same means of reaching it. His philosophy was utterly atheistic, like that of the original Sankhya school of philosophy, whose views he chiefly borrowed, and ignored a supreme God or Creator; it did not leave even an impersonal spirit of the universe into which the human soul could be absorbed. Gautama sees no escape but in what he calls NIRVANA, the exact nature of which has been matter of dispute. According to its etymology, the word means “extinction,” “blowing out,” as of a candle; and most orientalists are agreed that in the Buddhist scriptures generally it is equivalent to annihilation. Even in those schools which attempt to draw a distinction, the distinction is of the most evanescent kind. See NIRVANA.

The key of the whole scheme of Buddhist salvation lies in what Gautama called his four sublime verities. The first asserts that pain exists; the second, that the cause of pain is desire or attachment—the meaning of which will appear further on; the third, that pain can be ended by Nirvana; and the fourth shows the way that leads to Nirvana. This way to Nirvana consists in eight things: right faith, right judgment, right language, right purpose, right practice, right obedience, right memory, and right meditation. In order to understand how this method is to lead to the proposed end, we must turn to the metaphysical part of the system contained in the “concatenation of causes,” which may be looked upon as a development of the second “verity”—namely, that the cause of

pain is desire—or rather, as the analysis upon which that verity is founded. The immediate cause of pain is birth, for if we were not born, we should not be exposed to death or any of the ills of life. Birth, again, is caused by previous existence; it is only a transition from one state of existence into another. All the actions and affections of a being throughout his migrations leave their impressions, stains, attachments adhering to him, and the accumulation of these determines at each stage the peculiar modification of existence he must next assume. But for these adhesions, the soul would be free; not being bound down to migrate into any determinate condition of life, it would follow that it need not migrate at all. These adhesions or attachments, good and bad, depend upon desire, or rather, upon affection of any kind in the soul towards the objects; as if only what moved the soul to desire or avoidance could leave its impress upon it. We thus arrive at desire—including both the desire to possess, and the desire to avoid—as one link in the chain of causes of continued existence and pain. Beyond this the dependence of the links is very difficult to trace; for desire is said to be caused by perception, perception by contact, and so on, until we come to ideas. Ideas, however, are mere illusions, the results of ignorance or error, attributing durability and reality to that which is transitory and imaginary. Cut off this ignorance, bring the mind into a state in which it can see and feel the illusory nature of things, and forthwith the whole train vanishes; illusory ideas, distinction of forms, senses, contact, perception, desire, attachment, existence, birth, misery, old age, death!

Morality and Religious Observances.—The eight parts or particulars constituting the theoretical “way” (to Nirvana), was developed by Gautama into a set of practical precepts enjoining the various duties of common life and of religion. They are all ostensibly intended as means of counteracting or destroying the chain of causes that tie men to existence and necessitate being born again, especially that most important link in the chain constituted by the attachments or desires resulting from former actions; although the special fitness of some of the precepts for that end is far from being apparent. It is easy to understand how the austerities that are prescribed might subdue the passions and affections, and lessen the attachment to existence; but how the exercise of benevolence, of meekness, of regard to truth, of respect to parents, etc., on which Gautama laid so much stress, should have this effect, it is difficult to conceive. Luckily for the Buddhist world, Gautama’s moral nature was better than his logic, or rather than the perverse assumptions from which his logic starts; and as he felt strongly—what all men have felt more or less—that these things are essentially right and good, he takes it for granted that they must contribute to what was in his eyes the chief good—escape from existence, or Nirvana. In delivering his precepts, the Buddha considers men as divided into two classes—those who have embraced the religious life (*Sramanas*), and those who continue in the world, or are laymen. These last are considered as too much attached to existence to feel any desire or have any hope of emancipation, at least at this stage. But there are certain precepts which it is necessary for all to obey, that they may not bring greater misery upon themselves in their next births, and rivet the bonds of existence more indissolubly. There are ten moral precepts or “precepts of aversion.” Five of these are of universal obligation—viz., not to kill; not to steal; not to commit adultery; not to lie; not to be drunken. Other five are for those entering on the direct pursuit of Nirvana by embracing the religious life: to abstain from food out of season—that is, after midday; to abstain from dances, theatrical representations, songs, and music; to abstain from personal ornaments and perfumes; to abstain from a lofty and luxurious couch; to abstain from taking gold and silver. For the regular ascetics or monks, there are a number of special observances of a very severe kind. They are to dress only in rags, sewed together with their own hands, and to have a yellow cloak thrown over the rags. They are to eat only the simplest food, and to possess nothing except what they get by collecting alms from door to door in their wooden bowl. They are allowed only one meal, and that must be eaten before midday. For a part of the year, they are to live in forests, with no other shelter except the shadow of a tree, and there they must sit on their carpet even during sleep, to lie down being forbidden. They are allowed to enter the nearest village or town to beg food, but they must return to their forests before night.

Besides the absolutely necessary “aversions and observances” above mentioned, the transgression of which must lead to misery in the next existence, there are certain virtues or “perfections” of a supererogatory or transcendent kind, that tend directly to “conduct to the other shore” (Nirvana). The most essential of these are almsgiving or charity, purity, patience, courage, contemplation, and knowledge. Charity or benevolence may be said to be the characteristic virtue of Buddhism—a charity boundless in its self-abnegation, and extending to every sentient being. The benevolent actions done by the Buddha himself, in the course of his many millions of migrations, were favorite themes of his followers. On one occasion, seeing a tigress starved and unable to feed her cubs, he hesitated not to make his body an oblation to charity, and allowed them to devour him. Benevolence to animals, with that tendency to exaggerate a right principle so characteristic of the east, is carried among the Buddhist monks to the length of avoiding the destruction of fleas and the most noxious vermin, which they remove from their persons with all tenderness.

There are other virtues of a secondary kind, though still highly commendable. Thus,

not content with forbidding lying, the Buddha strictly enjoins the avoidance of all offensive and gross language, and of saying or repeating anything that can set others at enmity among themselves; it is a duty, on the contrary, especially for a *sramana*, to act on all occasions as a peacemaker. Patience under injury, and resignation in misfortune, are strongly inculcated. Humility, again, holds a no less prominent place amongst Buddhist graces than it does among the Christian. The Buddhist saints are to conceal their good works, and display their faults. As the outward expression of this sentiment of humility, Gautama instituted the practice of confession. Twice a month, at the new and at the full moon, the monks confessed their faults aloud before the assembly. This humiliation and repentance seems the only means of expiating sin that was known to Gautama. Confession was exacted of all believers, only not so frequently as of the monks. The edicts of Piyadasi recommend a general and public confession at least once in five years. The practice of public confession would seem to have died out by the time of Hiouen-Thsang's visit to India.

Such are the leading features of the moral code of the Buddha, of which it has been said, that "for pureness, excellence, and wisdom, it is only second to that of the Divine Lawgiver himself." But the original morality of Buddhism has, in the course of time, been disfigured by many subtilities, puerilities, and extravagances, derived from the casuistry of the various schools of later times; just as the casuistry of the Jesuits, for instance, perverted many of the precepts of Christianity. The theory on which the Buddha founds his whole system gives, it must be confessed, only too much scope to such perversions; for, on that theory, truth is to be spoken, self to be sacrificed, benevolence to be exercised, not for the sake of the good thus done to others, but solely for the effect of this conduct on the soul of the actor, in preparing him for escape from existence. To teach men "the means of arriving at the other shore," was another expression for teaching virtue; and that other shore was annihilation. On this principle, the Buddhist casuist can, like the Jewish, render of none effect the universal law of charity and the duty of respecting and aiding parents, on which the Buddha laid such stress. Thus, a *Bikshu*—that is, one who has engaged to lead a life of self-denial, celibacy, and mendicancy, and is thus on the high-road to Nirvana—is forbidden to look at or converse with a female, lest any disturbing emotion should ruffle the serene indifference of his soul; and so important is this, that "if his mother have fallen into a river, and be drowning, he shall not give her his hand to help her out; if there be a pole at hand, he may reach that to her; but if not, she must drown."—*Wilson*.

Contemplation and science or knowledge (i. e., of the concatenation of causes and effects) are ranked as virtues in Buddhism, and hold a prominent place among the means of attaining Nirvana. It is reserved, in fact, for abstract contemplation to effect the final steps of the deliverance. Thought is the highest faculty of man, and, in the mind of an eastern philosopher, the mightiest of all forces. A king who had become a convert to Buddhism is represented as seating himself with his legs crossed, and his mind collected; and "cleaving, with the thunderbolt of science, the mountain of ignorance," he saw before him the desired state. It is in this cross-legged, contemplative position that the Buddha is almost always represented—that crowning intellectual act of his, when, seated under the Bo-tree (q. v.), he attained the full knowledge of the Buddha, saw the illusory nature of all things, broke the last bonds that tied him to existence, and stood delivered for evermore from the necessity of being born again, being considered the culmination of his character, and the highest object of imitation to all his followers.

"Complete" Nirvana or extinction cannot, of course, take place till death; but this state of preparation for it, called simply Nirvana, seems attainable during life, and was, in fact, attained by Gautama himself. The process by which the state is attained is called *Dhyana*, and is neither more nor less than ecstasy or trance, which plays so important a part among mystics of all religions. The individual is described as losing one feeling after another, until perfect apathy is attained, and he reaches a region "where there are neither ideas, nor the idea of the absence of ideas!"

The *ritual* or *worship* of Buddhism—if worship it can be called—is very simple in its character. There are no priests, or clergy, properly so called. The *Sramanas* or *Bikshus* (mendicants) are simply a religious order—a kind of monks, who, in order to the more speedy attainment of Nirvana, have entered on a course of greater sanctity and austerity than ordinary men; they have no sacraments to administer or rites to perform for the people, for every Buddhist is his own priest. The only thing like a clerical function they discharge, is to read the scriptures or discourses of the Buddha in stated assemblies of the people held for that purpose. They have also everywhere, except in China, a monopoly of education; and thus in Buddhist countries education, whatever may be its quality, is very generally diffused. In some countries, the monks are exceedingly numerous, around Lhassa in Thibet, for instance, they are said to be one third of the population. They live in *viharas* or monasteries, and subsist partly by endowments, but mostly by charity. Except in Thibet, they are not allowed to engage in any secular occupation. The vow is not irrevocable. This incubus of monachism constitutes the great weakness of Buddhism in its social aspect. Further particulars regarding Buddhist monks and monasteries, as well as the forms of Buddhist worship generally, will be given when speaking of the countries where the religion prevails. See LAMAISM.

The adoration of the statues of the Buddha and of his relics is the chief external ceremony of the religion. This, with prayer and the repetition of sacred formulas, constitutes the ritual. The centers of the worship are the temples containing statues, and the topes or tumuli erected over the relics of the Buddha, or of his distinguished apostles, or on spots consecrated as the scenes of the Buddha's acts. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a dagoba or shrine containing his relics. Here flowers,* fruit, and incense are daily offered, and processions are made with singing of hymns. Of the relics of the Buddha, the most famous are the *teeth* that are preserved with intense veneration in various places. Hiouen-Thsang saw more than a dozen of them in different parts of India; and the great monarch Ciladitya was on the eve of making war on the king of Cashmere for the possession of one, which, although by no means the largest, was yet an inch and a half long. The tooth of the Buddha preserved in Ceylon, a piece of ivory about the size of the little-finger, is exhibited very rarely, and then only with permission of the English government—so great is the concourse and so intense the excitement. See CEYLON.

There appears at first sight to be an inconsistency between this seeming worship of the Buddha and the theory by which he is considered as no longer existing. Yet the two things are really not irreconcilable; not more so, at least, than theory and practice often are. With all their admiration of the Buddha, his followers have never made a god of him. Gautama is only the last Buddha—the Buddha of the present cycle. He had predecessors in the cycles that are past (24 Buddhas of the past are enumerated, and Gautama could even tell their names); and when, at the end of the present cycle, all things shall be reduced to their elements, and the knowledge of the way of salvation shall perish with all things else, then, in the new world that shall spring up, another Buddha will appear, again to reveal to the renaissance beings the way to Nirvana. Gautama foretold that Mitraya, one of his earliest adherents, should be the next Buddha† (the Buddha of the future), and he gratified several of his followers with a like prospect in after-cycles. The Buddha was thus no greater than any mortal may aspire to become. The prodigious and supernatural powers which the legends represent him as possessing, are quite in accordance with Indian ideas; for even the Brahmins believe that by virtue, austerities, and science a man may acquire power to make the gods tremble on their thrones.

The Buddha, then, is not a god; he is the ideal of what any man may become; and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable, among the ignorant, from worship of him as a present god; but in theory, the ritual is strictly commemorative, and does not necessarily involve idolatry, any more than the garlands laid on the tomb of a parent by a pious child. See TOPE.

The prayers addressed to the Buddha are more difficult to reconcile with the belief in his having ceased to exist. It is improbable, indeed, that the original scheme of Buddhism contemplated either the adoration of the statues of the Buddha, or the offering of prayers to him after his death. These are an after-growth—accretions upon the simple scheme of Gautama, and in a manner forced upon it during its struggle with other religions. For, a system of belief that seeks to supplant other systems, finds itself enticed to present something to rival and outdo them, if possible, in every point. Even the Christian church, in the middle ages, adopted with this view many of the rites and legends of paganism that were quite inconsistent with its own character; merely casting over them a slight disguise, and giving them Christian names. Prayer, too, is natural to man—an irrepressible instinct, as it were, and had to be gratified. And then the inconsistency in uttering prayers when there is no one to hear or answer, glaring as it appears to us, is by no means great to the eastern mind. Prayers, like other formulas, are conceived less as influencing the will of any superior being to grant the request, than as working in some magical way—producing their effects by a blind force inherent in themselves. They are, in short, mere incantations or charms. Even the prayers of a Brahman, who believes in the existence of gods, do not act so much by inclining the deity addressed to favor the petitioner, as by compelling him through their mysterious potency—through the operation of a law above the will of the highest gods. The Buddhist, then, may well believe that a formula of prayer in the name of “the venerable of the world” will be potent for his good in this way, without troubling himself to think whether any conscious being hears it or not.

The element in Buddhism which more than any other, perhaps, gave it an advantage over all surrounding religions, and led to its surprising extension, was the spirit of universal charity and sympathy that it breathed, as contrasted with the exclusiveness of

*The quantity of flowers used as offerings is prodigious. A royal devotee in Ceylon, in the 15th c., offered on one occasion 6,480,320 flowers at the shrine of the tooth. At one temple it was provided that there should be offered “every day 100,000 flowers, and each day a different flower.”

†One who is on the way to become a supreme Buddha, and has arrived at that stage when he has only one more birth to undergo, is styled a *Bodhisatva* (having the essence of knowledge); a mere candidate for Nirvana is an *arhat* (venerable).

caste. In this respect, it held much the same relation to Brahmanism that Christianity did to Judaism. It was, in fact, a reaction against the exclusiveness and formalism of Brahmanism—an attempt to render it more catholic, and to throw off its intolerable burden of ceremonies. Buddhism did not expressly abolish caste, but only declared that all followers of the Buddha who embraced the religious life were thereby released from its restrictions; in the bosom of a community who had all equally renounced the world, high and low, the twice-born Brahman and the outcast were brethren. This was the very way that Christianity dealt with the slavery of the ancient world. This opening of its ranks to all classes and to both sexes—for women were admitted to equal hopes and privileges with men, and one of Gautama's early female disciples is to be the supreme Buddha of a future cycle—no doubt gave Buddhism one great advantage over Brahmanism. The Buddha, says M. Müller, "addressed himself to castes and outcasts. He promised salvation to all; and he commanded his disciples to preach his doctrine in all places and to all men. A sense of duty, extending from the narrow limits of the house, the village, and the country, to the widest circle of mankind, a feeling of sympathy and brotherhood towards all men, the idea, in fact, of humanity, were first pronounced by Buddha." This led to that remarkable missionary movement, already adverted to, which, beginning 300 B.C., sent forth a succession of devoted men, who spent their lives in spreading the faith of Buddha over all parts of Asia.

For the history of Buddha and his religion see Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (1876); Köppen, *Die Religion des Buddha* (1857); Oldenburg, *Buddha* (1881; Eng. trans. 1882); Wurm, *Der Buddha* (1880); St. Hilaire, *Le Bouddha* (1862); Wassiljew, *Der Buddhismus* (1860); Kern, *Geschiedenis van het Buddhasme* (1884); Rhys-Davids, *Buddhism* (1880), and *Hibbert Lectures* (1881); Mills, *The Indian Saint* (1876); Arnold, *The Light of Asia* (1882); Feer, *Études Bouddhiques* (1873); Titcomb, *Buddhism* (1885); Bastian, *Der Buddha in seiner psychologie* (1882); Alvis, *Buddhist-Nirvana* (1871); Sénart, *La Légende du Bouddha* (1875); Bigandet, *Legend of Gaudama* (1886); Obry, *Du Nirvana Bouddhique* (1863); Max Müller, *Buddhist Nihilism* (1869); Lillie, *Buddha* (1881); Seydel, *Das Evangelium und die Buddhasage* (1882); Eitel, *Buddhism* (1873); Kistner, *Buddha* (1869), with a complete bibliography; Sir Monier Williams, *Buddhism* (1888); the works of Beal, Edkins, Eitel, Legge, and Schott for Chinese Buddhism; of Köppen and Schlagintweit for Tibetan; and of Alabaster for Siamese.

The following are some of the principal translations of, or compilations from, original works in Pali, Sanskrit, Tibetan, and Chinese: Spence Hardy, *Manual of Buddhism* (1860); *Eastern Monachism* (1860), and *Legends and Theories of the Buddhists* (1866); Burnouf, *Le Lotus de la Bonne Loi* (1852); Schiefner, *Turanatha's Geschichte des Buddhismus* (1869) and *Lebensbeschreibung Sakjamunis* (1849); Rhys-Davids, *Buddhist Birth Stories*, vol. 1 (1880); Rogers, *Buddhaghosha's Parables* (1870); Foucaux, *Histoire du Bouddha* (1868); *Lalita Vistara*, by Raj. Mitra and Lefmann; *Dhammapada*, by Fausbøll, Müller, Beal, Rockhill, Weber, and Schulze; parts of the canon in *Sacred Books of the East*, vols. x., xi., xiii., xvii., xix., and xxi.

BUDDING, sometimes called **INOCULATION**, is an operation analogous to Grafting (q.v.), or indeed may be regarded as merely a particular mode of grafting, in which a leaf-bud is used as a graft instead of a young shoot. It is generally preferred for trees which are apt to throw out much gum when wounded, as the plum, cherry, peach, apricot, and stone-fruits in general, also for roses and many other flowering shrubs. The time for it is when the bud is perfectly formed, about or a little after midsummer. The bud to be employed is taken, by means of a sharp knife, from the branch on which it has grown—generally a branch of the former year—a small portion of the bark and young wood being taken with it, extending to about half an inch above and three quarters of an inch below the bud. The woody part is then separated from the bark and bud; but care is to be taken that the bud itself is not injured, which, however, is always the case when the operation is attempted before the bud is sufficiently matured, and is indicated by a hollow left at the bud when the wood has been removed. A longitudinal and a transverse cut are made in the bark of the stock intended to receive the bud, in the form of the letter T; the bark is raised on both sides, for which purpose the handle of the *budding-knife* generally terminates in a thin ivory blade, and the bud is inserted, the bark attached to the bud being cut across so as to join exactly to the transverse cut in that of the stock, that the bud may be nourished by the descending sap. The leaf in the axil of which the bud grew is cut off. The newly-inserted bud is for a time preserved in its place, and prevented from too much access of air by strands of bass-matting. The process just described is distinctively called *shield-budding*, and is the most common method of budding. Other methods are occasionally employed, as *reversed shield-budding*, in which the incisions are in the form of the letter T reversed, which is sometimes practiced with trees of the orange family and others in which there is a very great flow of descending sap; and *scallop-budding*, in which a thin slip of bark is removed from the stock, and a similar slip bearing the bud is placed upon it, the upper edge and one of the lateral edges being made to fit exactly. Scallop-budding may be performed in spring, and if it fails, the ordinary method may be resorted to in summer. B. is also sometimes performed by taking a tube of bark with one or more buds from a small branch, and placing it upon a branch of similar thickness in the stock, from which the bark has been removed.

BUDDLEA, a genus of shrubs of the natural order *scrophularineæ*, of which many species are known, all natives of the warmer parts of the world, and some of them much

admired for their beautiful flowers. *B. Neemda* has received the praise of being one of the most beautiful plants of India. *B. globosa*, a native of Chili, with downy branches, lanceolate leaves, and globose heads of orange-colored flowers, is hardly enough to endure the climate of most parts of England, and has become a very common ornament of gardens, but in Scotland it needs the protection of the greenhouse or frame.

BUDE BURNER and **BUDE LIGHT**. The burner, so called from the name of the residence of the inventor, Mr. Gurney, consists of two, three, or more concentric argand burners, each inner one rising a little above the outer. On the same principle, a powerful light is produced by a number of flat flames disposed in concentric circles like the petals of a rose.—The Bude light, also the invention of Mr. Gurney, depends upon introducing oxygen into the center of the flame instead of air, as in the common argand. A light of the most dazzling brilliancy is thus produced. The house of commons is lighted by this means, the brilliancy being softened by the intervention of a ceiling of ground-glass.

BUDGE, **EUSTACE**, 1686–1737, a writer for the *Tatler*, *Spectator*, and *Guardian*. He was under-secretary to Addison, and afterwards a member of the Irish parliament. Still later he was controller-general of the revenue in Ireland, from which office he was removed because of a lampoon written by him upon the lord lieutenant. In 1720, he lost £20,000 in the South Sea scheme, and afterwards spent £5000 to get into parliament, but did not succeed. Then he started the *Bee*, a short-lived weekly journal. Lawsuits accumulated, and he ended his troubles by drowning, leaving on his table a slip of paper on which was written “What Cato did, and Addison approved, cannot be wrong.”

BUDGET, from the same source as the French *bougette*, means a small bag, and has been used metaphorically to express a compact collection of things, as a budget of news, a budget of inventions, and the like. Water-budgets or buckets were a very honorable blazon on a coat-armorial, as being generally conferred in honor of some valiant feat for supplying an army with water. Guillim, in his *Display of Heraldry*, thinks the three mighty men in David's army who broke into the host of the Philistines, and drew water from the well of Bethlehem, “deserved to have been remunerated with such armorial marks on their coat-armors for their valor.”

The term, “The Budget,” is in Britain, from long usage, applied to that miscellaneous collection of matters which aggregate into the annual financial statement made to parliament by the chancellor of the exchequer. It contains two leading elements—a statement how the nation's account of charge and discharge stands in relation to the past, and an explanation of the probable expenditure of the ensuing year, with a scheme of the method in which it is to be met, whether by the existing or new taxes, or by loan. The statement of the budget is always an important, sometimes a very exciting occasion; as for instance, sir Robert Peel's adoption of an income-tax in 1842, and his legislation for free-trade in 1846. Another instance is Mr. Goschen's budget proposals in connection with licensing in 1890.

BUDHA'NUH, a t. of India, in the British district of Mozuffurnuggur, n.w. provinces, on the route from Kurnoul to Meerut, 43 m. s. from Kurnoul. The surrounding country is wooded and well cultivated, and the bazaar of the town is well supplied. Pop. 5900.

BUDINGTON, **WILLIAM IVES**, D.D., b. Conn., 1815; graduated at Yale, and in theology at Andover. He was ordained in 1840, and took charge of the First Congregational Church in Charlestown, Mass., remaining there 14 years. He published a history of that church in 1845. In 1855, he took charge of the Clinton Avenue Church, Brooklyn, New York. Failing health compelled him to relinquish public duties early in 1879, and he died in November. Dr. B. was one of the acknowledged leaders in his denomination.

BÜDOS HEGY, a mountain belonging to the Carpathians, on the eastern border of Transylvania, in lat. 46° 12' n., and long. 25° 40' east. It is quite isolated, steep, and of conical shape, densely wooded on the lower slopes, and has an elevation of 7340 feet. It has numerous caverns, that emit sulphurous exhalations, and from its base issue strong sulphur springs.

BUDWEIS, a t. of Bohemia, situated on the Moldau, about 77 m. s. of Prague. B. is well built, is partially fortified, and has an old cathedral, manufactures of woolens, stone-ware, machines, lead-pencils, saltpeter, etc. It has also a brisk trade in grain, wood, coals, and salt. There are numerous schools, both for education in the Bohemian and in the German tongue. The Slavic name of B. is *Budejowice*. Pop. '90, 28,491. In the neighborhood are an old feudal fortress, the Schloss Frauenberg, one of the seats of prince Schwarzenberg, and a fine new Gothic castle also belonging to the same family.

BUEL, **JESSE**, 1778–1839; agriculturist, b. in Conn., began life as a printer, and established the *Albany Argus* in 1813, continuing as the publisher until 1821, when he retired to a farm and became one of the most successful cultivators in the country. In 1834, he started the *Albany Cultivator*, and subsequently published the *Farmer's Instructor* and the *Farmer's Companion*.

BUELL, DON CARLOS, b. Ohio, 1818; a graduate of West Point; served in the Florida and Mexican wars, from 1849 to 1861, assistant adjutant-general in various military departments; in the latter year commanding the department of the Ohio, and in 1862 made maj-gen. of volunteers. He resigned from the army in 1864, and was subsequently president of an iron works corporation, and pension agent at Louisville, Ky.

BUENA VISTA, a co. in n.w. Iowa, traversed by the Illinois Central railroad, and watered by Coon and other rivers; 576 sq. m.; pop. '90, 13,547. Agriculture is the main business. Co. seat, Storm Lake.

BUENA VISTA, a small settlement in Coahuila, Mexico, on the San Juan, a tributary of the Rio Grande, 7 m. s. of Saltillo; the site of a battle between the United States forces under Gen. Taylor and the Mexicans under Santa Anna, Feb. 23, 1847, the former with 5200 men and the latter with about 20,000. After two days of sharp fighting, Santa Anna was defeated with a loss of nearly 2000; Taylor's loss being 746. The result was due in great part to the superior effectiveness of Taylor's artillery.

BUEÑ AYRÉ, in Spanish, or **BOÑ AIR** in French, an island in that subdivision of the West Indies which runs parallel with the coast of Venezuela. It is in lat. 12° 20' n., and long. 68° 27' w., being 30 m. to the e. of Curaçao, which, like itself, belongs to the Dutch. B. A. produces cattle and salt. It measures 20 m. by 4, and contains about 4000 inhabitants. It has a tolerable harbor on its leeward or s.w. side.

BUEÑOS AYRES (*Buenos Aires*), the largest and most important province of the Argentine Republic in South America, extends itself along the Atlantic, from the mouth of the Plata to that of the Rio Negro on the 41st parallel; on the n.e. it is washed by the Plata and the Paraná, the latter separating it from Entre Rios. Its area is estimated at 63,000 sq. m., with a population of (1895) 921,225. Besides the existing province of the name, it at one time comprised Uruguay or Banda Oriental, Paraguay, Bolivia, and the Argentine Confederation, being originally an appendage of Peru, under the immediate command of a capt. gen., and becoming, in 1775, a separate vice-royalty of itself. Though the first three of these four divisions broke off chiefly in connection with the revolutionary struggle, yet the fourth continued, down to 1853, to recognize the city of B. A. as its head; and the inland states endeavored both by war and diplomacy to re-annex the maritime province to the republic, till, in June, 1860, their object was obtained, and the city remained capital of the province and temporary capital of the confederation until it was federalized in 1880; the seat of the provincial government being removed to La Plata, 30 m. to the s.e. in 1884. Like each of the other provinces, Buenos Ayres has its own budget and its own judicial system. In 1895 its revenue was \$13,125,667, and its expenditure \$12,881,551. Its governor is elected by the people in the province, and is independent of the central executive in his constitutional functions. Besides two members of the national senate, who are chosen by the provincial legislature, Buenos Ayres being the most populous of the provinces sends a larger number of representatives to the national chamber of deputies than any other state. The coast line, 740 m., with about 150 m. on the Paraná, is low and sandy, and the ports are few. The harbor of the city of B. A. is very bad and Bahía Blanca, in the extreme s., is little frequented; but the newly founded La Plata possesses a harbor at once commodious and accessible. In 1887 a bill was passed for establishing "agricultural colonies" at all railway stations within 60 m. of the capital, where towns did not already exist.

The country approaches so nearly to a plain, that most of the rain which falls is either absorbed or evaporated, or lost in salt-lakes, comparatively little drainage entering the Paraná or the Plata. The climate, though on the whole healthy and agreeable, is yet by no means steady or uniform. Every wind, in general, has, to a remarkable degree, its own weather—sultriness coming from the n., freshness from the s., moisture from the e., and storm from the w.; and besides the periodical heats of every summer, successive years of more than ordinary drought occur. Agriculture, properly so called, is followed chiefly in the more temperate and humid districts of the eastern coast; while the interior presents an almost uninterrupted pasturage to countless herds of horses and cattle. Under these circumstances, the business of grazing and hunting combined occupies or interests the great bulk of the population—a business that renders the province, whether as to the disposal of its productions or as to the supply of its wants, peculiarly dependent on that external commerce, which, throughout the whole of Spanish America, has naturally been identified with political freedom. Let it be added that the Indians are intractable, and that the Africans, few in number at best, are principally menials; and it is seen at once why, in spite of national jealousies and sectarian prejudices, immigration from Europe has been not only tolerated by public opinion, but also encouraged by legislative enactments.

BUEÑOS AYRES, a city of South America, on the right bank of the Plata, which here, at a distance of 150 m. from the open sea, is 36 m. across. It stands in lat. 34° 36' s., and long. 58° 24' w. Its disadvantages as a maritime town are great; the flood-tides of the ocean, when backed by easterly winds, being apt to make the estuary overflow its banks; and again, when westerly winds prevail, the estuary loses both width and depth. Monte Video, on the opposite shore, possesses a better harbor, and is nearer to

the Atlantic, nor can it be doubted that, but for the greater facilities of B. A. in carrying on an inland trade, the former town would have proved a dangerous rival. Steam is rapidly placing both upon more equal terms. Of the trade, however, with Chile by Mendoza and the Andes—a trade which must always be carried on by land—B. A. must still command the monopoly. In 1887 a system of harbor works (docks, basins, etc.) was commenced, to cost \$20,000,000, and to connect the two channels of the Plata bringing the largest vessels up to the wharf. A thorough scheme of water supply and drainage has been undertaken in recent years. B. A. labors under some peculiar disadvantages, its immediate territory, purely alluvial, being almost destitute of timber and stone, and fuel is almost as scarce as building material. The city including suburbs, contained (1896) 690,788 inhabitants against 459,663 in 1887. In June 1896 a census of the city showed that about 345,500 of the inhabitants were foreigners. Newspapers are published in the French, English, Italian, German, and Spanish languages. The city is regularly laid out. The streets cross each other at right angles, and are for the most part paved with granite. A thorough drainage system is being carried out, and there are many miles of street railways. But the narrowness of the streets prevents the laying of a double track, and the cars travel by one street and return on a parallel street. A system of boulevards is being carried out and new thoroughfares cross the old streets in a diagonal direction. Most of the houses are one story high, but newer buildings are often of considerable dimensions. The government building is large and imposing. It is situated on one side of the principal square, the Plaza de la Victoria. The University occupies a fine building and has an extensive library. The river Plata, which is here 36 miles broad, is navigated with difficulty, and the largest vessels are obliged to anchor several miles off in the roadstead, whence their cargoes are discharged by means of lighters. For several years a system of harbor works (docks, basins, etc.) has been in process of construction. It is estimated that about one-half of the tonnage entered and cleared at Argentine ports belongs to this port. Notwithstanding the efforts to improve the sanitary condition of the city, the mortality among children is still very great.

In 1882 Buenos Ayres, which up to that time had been the capital of the province of the same name, was placed, together with the surrounding district of 83 sq. mi., under the Federal Government. A continental exhibition was held here in 1882. B. A. was founded in 1535; but having subsequently been twice destroyed by the Indians, it ought, in reality, to date only from 1580. In the beginning of the nineteenth century, it achieved, with very little aid from home, two triumphs over England. In 1806, one British force, which had just captured the city, was obliged to surrender; and in 1807, another which attempted to recover the place, was repulsed with heavy loss; and these successes over so formidable a foe emboldened the colonists, three years afterwards, to throw off the yoke of Spain.

BUFFALO, *Bos bubalus*, an animal of the ox tribe, very important and useful to man. It is a native of the East Indies, where it has been long domesticated, and from which it was carried to Egypt and to the south of Europe. It was introduced into Italy about the close of the 6th c., A.D. The name B. is popularly though incorrectly given to the American bison which will be found fully treated in the article **BISON**.

The B. is larger than the ox, and its limbs are stouter. Its form is more angular and clumsy; the head is larger in proportion to the size of the body; and the forehead is rather convex, and higher than broad; the dorsal line rises into a considerable elevation above the shoulders; the dewlap and the tail resemble those of the ox; the horns are large, slightly compressed, recline towards the neck, and have their points turned up. It is characteristic of the B., when walking or running, to carry the head with the muzzle projecting straight forward, and the horns laid back on the shoulders. The hair is irregular and bristly, often very thin, so that the smooth brown hide "shines with an unpleasant polish in the sunlight." In this as in other respects, the animal is adapted for marshy situations, which it naturally affects; preferring for its food the rank coarse herbage which they afford, delighting to immerse itself in water till only its head appears above the surface, in which condition it will remain for hours, and often enveloping itself in mud as a protection against insects. On account of these propensities, the buffaloes used as beasts of burden in India are seldom laden with any goods liable to be spoiled by water, as the animal is always ready to take an opportunity of lying down with his load in any river or pond which presents itself. In Italy, the B. seems nowhere more at home than in the Pontine marshes and the pestilential Maremma.

The B. is a very powerful animal, much more powerful than the ox, and capable of dragging or carrying a far heavier load. The female yields a much greater quantity of milk than a cow, and of excellent quality. It is from B. milk that the *ghee* or semi-fluid butter of India is made. The hide is greatly valued for its strength and durability, but the flesh is very inferior to that of the ox.

The B. exhibits a considerable amount of intelligence. In a state of domestication, it is capable of becoming very docile. In the s. of Europe, it is generally managed by a ring passed through the cartilage of the nose, but in India by a mere rope. The Indian driver rides upon a B.; but these animals keep so closely together as they are driven along, that, if necessary, he walks from the back of one to that of another perfectly at his ease. In a wild state, the B. is savage and dangerous, and even in domesti-

cation it is apt to resent injury. The native princes of India make buffaloes and tigers fight in their public shows; and a B. is more than a match for a tiger. If a tiger is encountered by a herd, he is quickly gored or trampled to death.

The B. is used in some parts of the east in the shooting of water-fowl, being trained to the sport, and sold at a considerable price. The sportsman conceals himself behind the B., which, being a familiar sight, is not alarming to the birds.

The CAPE B., *Bos Caffer*, is generally regarded as a distinct species. It seems never to have been reduced to the service of man, although there is reason to believe it to be very capable of domestication. The horns are very large; they spread horizontally over the top of the head, and are then bent down laterally, and turned upwards at the point. The head is carried, as by the common B., with projecting muzzle and reclining horns, but the bases of the horns nearly meet on the forehead, where they are from 8 to 10 in. broad. The length of a full-grown Cape B. is about 8 ft. from the root of the horns to the tail, and the height 5½ ft. This animal, regarded as the most formidable in South Africa, is still found in large herds in the interior. The hide is so thick and tough that the Caffres make shields of it, and the balls used in shooting B. are mixed with tin, and yet are often flattened by the resistance. The Cape B. grazes chiefly in the evening, and lies in woods and thickets during the day.

An attempt has been made to establish a genus, *limbalus*, having the common B. for its type; but the characters lack precision, and the limits are uncertain.

BUFFALO, a co. in s. central Nebraska, on the Platte river, and intersected by the Union Pacific r.r.; 882 sq.m.; pop. '90, 22,162; soil fertile. Co. seat, Kearney.

BUFFALO, a co. in southern S. Dakota; on the Missouri river, and watered by Soldier, Crow, Campbell, and Elm creeks; created, 1864, when it included nearly all of Dakota; organized 1871; area, 510 sq.m.; pop. 1890, 993; industry, farming. Co. seat, Gann Valley.

BUFFALO, a co. in w. Wisconsin, on the Mississippi, Chippewa, and Trempeleau rivers, and drained by B. river; 657 sq.m.; pop. 1890, 15,997; surface irregular; products, grain and wool. Co. seat, Alma.

BUFFALO, capital of Erie county, N. Y.; third city in the state in population and importance, is at the eastern extremity of Lake Erie, at the head of Niagara River, twenty miles above Niagara Falls, where Buffalo Creek enters the Lake. It is in latitude 42° 53' east, and longitude 78° 52' west; 539 miles east of Chicago; 182 miles northeast of Cleveland; 352 miles west of Albany; 460 northwest of New York. The Erie Basin, protected by a breakwater, is the western terminus of the Erie Canal.

As early as 1679 this locality was visited by the French under La Salle, and at that time he built the first ship to navigate these waters, a vessel of only sixty tons, called the Griffin. It filled the savages with fear and awe when it sailed away on its first and last voyage, as it never returned from its trip to Lake Huron. In 1687 this admirable location was selected for a settlement by Baron La Honton, and Fort Supposé was erected; in 1783-4 it was a British garrison, under the name of Fort Erie. The settlers began building vessels for war and commerce and the navigation of the Great Lakes was commenced, which has since developed into such gigantic proportions. The spot was included in a tract purchased by the "Holland Land Company" in 1792-93 and in 1801 New Amsterdam was founded by the Dutch. In 1810 the name was changed to Buffalo by act of legislature, supposed to be derived from the immense herds of buffalo that frequented the locality for water. During this year the first steamboat called Walk-in-the-Water started westward from the city, and was quickly followed by many others. In 1813 Buffalo was incorporated and made a military post, and December 30th it was surrendered to the British, who devastated and burned it. In 1815 it was rebuilt, but its growth was slow till 1825, when the opening of the Erie Canal materially advanced its prosperity. In 1832 it became a city, and since 1857 it has been noted for its manufactures and commerce. Its harbor is guarded by Fort Porter, and a tall light-house guides its shipping into safety.

With an altitude of 600 feet above the sea-level, a mean summer temperature of 67.29°, a mean winter temperature of 26.77°, the climate is delightful. The ground rises gradually from the Lake shore to the height of fifty feet, when it forms an extended plain, from which a fine view of the city, Lake, Niagara River, and surrounding country may be obtained. At one spot the ascent is by a precipitous bluff, which adds to the picturesque effect of the scene.

Although finely located for a great commercial centre, Buffalo had, originally, no facilities for harboring vessels. By a series of breakwaters north and south of the mouth of Buffalo Creek or Inlet, an inner harbor is formed, protected in front by another breakwater, erected by the United States Government. Numerous and extensive substantial piers, forming basins and canals, have been constructed by the State at the expense of millions of dollars; the uniform depth of the water being sixteen feet. Buffalo has a magnificent water-front of about eight miles, two and a half on the Lake, and the same on Buffalo River, with room for extension down Niagara River for some miles. Buffalo River is navigable for two miles, and two canals pass along the western

boundary between the city and the River and Lake, the Erie running to the north of Buffalo Inlet, and a ship canal, six miles long, to the south of it. The streets are broad, well paved with stone or asphalt, and cross each other mostly at right angles. The principal ones, Main, Delaware and Niagara, are five and six miles long and 120 feet wide, lined with costly dwellings and beautiful shade trees. There are more than fifty miles of street railroads, and a steam belt-line for suburban traffic. It has an efficient fire and police department, telephone service, and gas and electric lights. Water is pure and abundant, and the sewage is carried off by tunnel into Scajaquada, Buffalo and Cazenovia Creeks, thence to Niagara River. Buffalo claims to be the cleanest, healthiest and best-lighted city in the United States. There are many squares and public places, and a combination of parks and pleasure grounds, with connecting boulevards, affords a continuous drive of more than fifteen miles. The principal park in the city covers an area of 350 acres, has a large lake and groves of forest trees. The Parade Ground contains fifty-six acres; the Front, on the Niagara, thirty-two acres. Falconwood and Oakfield, on Grand Island, are fashionable club grounds. Near the Park is one of the best driving courses in the country. There are more than twenty cemeteries and a crematory.

Many elegant public buildings adorn the city. Among these are the new Post Office and Custom House, which cost \$2,000,000; the State Armory and Arsenal; the City and County Hall, with tower 245 feet high, and costing over \$2,000,000; Music Hall; Merchants' Exchange; Y. M. C. A. Building; Fitch Institute; General Hospital; Buffalo Library, Niagara Hotel; Board of Trade Building; State Insane Asylum, which has a front of 2700 feet, and cost \$3,000,000, and the Roman Catholic and Protestant Episcopal cathedrals. The principal public monuments are the Soldiers and Sailors, Lafayette Square, and those to Red Jacket and President Fillmore in Forest Lawn Cemetery.

Buffalo has several discount banks, including 2 national, and savings banks, and building and loan associations. Besides the two cathedrals there are nearly 260 churches. Among the charitable institutions are Fitch Institute, containing within its walls a *crèche* and other charities, all managed by the Charity Organization Society, the oldest of the kind in the United States; the Orphan Asylum; Home for the Friendless (Prot.); St. Vincent's (Rom. Cath.) Orphanage for girls; St. Joseph's (Rom. Cath.) for boys; State Asylum for the Insane; Church Home (Prot.) for aged women; St. John's Orphan Home; Ingleside Home for erring women; St. Mary's Asylum for widows and foundlings; St. Mary's Institution for deaf mutes; an eye and ear infirmary; a dispensary, and five hospitals.

Educational institutions are numerous and efficient. There are a State Normal School; 68 public school buildings; public school property valued at over \$2,500,000; two medical colleges; St. Joseph's and St. Canisius' Colleges (Rom. Cath.); Buffalo Seminary, Academy of the Sacred Heart, Holy Angels' Academy, etc. There are 13 reference and free public libraries, including the Y. M. C. A., the Grosvenor (reference), and the German Young Men's Association. The Buffalo Library building is also occupied by the Historical Society, with a large library and cabinet, and the Society of Natural Sciences, which has an extensive collection and large museum. There are also a Historical Society, Law Library, an Art Gallery, and a Decorative Art Society. Of 64 periodicals, 11 are daily, 26 weekly, 23 monthly, and 3 quarterly.

The leading places of amusement are Grand Central Opera House, Music Hall, the Academy of Music, and the elegant Star Theatre. There are sixteen musical organizations, including the Liedertafel, one of the oldest in the United States, and the Philharmonic.

Buffalo's manufacturing interests are extensive and varied. Foundry and machine-shop products, including stoves, nails, etc., and agricultural implements valued at nearly \$7,400,000, take the lead, and in the production of these this city ranks next to Pittsburg. Slaughtering and meat-packing amount to \$7,700,000; clothing of men and women, to \$4,800,000; flouring and grist-mill products, \$3,650,000; brick, stone, lime, and stucco, \$3,000,000; refining petroleum, \$1,800,000; malt and distilled liquors, \$3,275,000; soap and candles, \$2,100,000; furniture, \$1,600,000; shipbuilding, \$1,150,000; tobacco and cigars, \$900,000. Besides these are immense establishments manufacturing saddlery and harness, cars, awnings, tents, sails, willow-ware, carriages, wagons, cutlery, hardware, mattresses, refrigerators, jewelry, hosiery, patent medicines, surgical appliances, etc. Total number of establishments in 1890, 3,565; capital invested, \$70,707,145; 51,433 persons employed; total value of products, \$100,052,208.

Buffalo is the great commercial centre of all this section of the country, and having many advantages as a residence, its ratio of increase has been unprecedented. It is connected by several great steamship lines and innumerable independent vessels, with the chief ports on the Great Lakes, and there are several ferries to Victoria and Fort Erie on the Canada side. This city is not only connected with the tide-waters of the Hudson by the Erie Canal, but is the terminus or connecting point of more than a score of railroads; among them are the Lake Shore and Michigan Southern; Canada Southern branch of the Michigan Central; a branch of the Grand Trunk of Canada; New York Central; West Shore; Delaware, Lackawanna and Western; New York, Lake Erie and Western; Lehigh Valley; Western New York and Pennsylvania; Buffalo, Rochester and Pittsburg; and New York, Chicago and St. Louis. The transfer yards at East

Buffalo are the largest in the world. The International Bridge across the Niagara at Buffalo cost \$1,500,000.

The records of navigation for many years show that the Lake opened at dates ranging from March 16th to May 3d; that for seven years the canal opened in May (7th-11th); that with one exception it closed every year in December, and from 1883-87 regularly on Dec. 1st. Buffalo River and the Ship Canals furnish the principal facilities for loading and unloading vessels, affording about twenty-seven miles of dock front.

A Board of Trade was organized in 1844 and incorporated in 1857. The immense quantity of flour and grain annually moved from the Western States to the sea-board constitutes the most important feature of the commerce of Buffalo, and the facilities for handling and storing it are unexcelled by those of any other American city. The first grain elevator in the world was built in Buffalo in 1843 by Joseph Dart. In 1887 there were thirty-three, with storage capacity of 13,015,000 bushels; in 1890, forty-five, storing 16,000,000 bushels. Many of these elevators are costly structures of stone, or of iron and brick; several have grain "driers" attached. The "Niagara B" elevator will store 1,200,000 bushels; the "Bennett" has an hourly capacity of 19,000 bushels.

During the fiscal year 1895-6, the imports of merchandise were valued at \$3,292,277, and the exports at \$4,429,084—total foreign trade, \$7,721,361. The entrances of shipping at the Buffalo Creek custom house were 380 American sailing vessels of 69,015 tons, 461 American steam vessels of 229,739 tons, 206 foreign sailing vessels of 30,467 tons, and 130 foreign steam vessels of 11,805 tons—total vessels, 1,177, total tonnage, 341,026. The clearances were 360 American sailing vessels of 56,221 tons, 405 American steam vessels of 153,217 tons, 200 foreign sailing vessels of 28,406 tons, and 121 foreign steam vessels of 7,702 tons—total vessels, 1,086, total tonnage, 245,546; grand total, vessels, 2,263, tonnage, 586,572. Including vessels registered at other ports on the great lakes and those belonging to local corporations, the shipping engaged in the foreign and domestic trade of the city exceeds 10,000 vessels. The largest article of trade is grain, of which 20,236,114 bushels were shipped by canal in 1895, and 94,287,770 bushels by railroad. The live-stock trade ranks second, in which Buffalo is next to Chicago; the lumber and timber trade follows; and then the coal trade.

Among the imports not specified above are copper and copper-ore, iron and iron-ore, lead, flax seed, lard, pork, salt, fresh and salt fish, hides and skins, scrap-iron and steel, staves, railroad-ties, wool, oil-cake and petroleum, pig, bloom and bar-iron, rock and superphosphates, stone and lime. The principal articles of export besides those mentioned above are plaster, cement and railroad-iron, oil meal and cake, lime and clay, refined and crude petroleum, rock and superphosphates.

The city is governed by a mayor and common council, a treasurer, comptroller, city attorney, superintendent of education, city engineer, overseer of the poor and three assessors. The Erie County Penitentiary, one of the six penal establishments of the state, is located in Buffalo. Fort Porter, although dismantled, is a military post, and a regiment is stationed there. A small yield of natural gas has been secured near Black Rock, but it is piped from Pennsylvania in sufficient quantity to be of service, to some extent, for domestic purposes.

The assessed valuation in 1895 was \$234,651,400; net debt, 1896, \$11,972,850.

Population in 1820, 2095; 1832, 15,000; 1860, 81,129; 1880, 155,134—51,268 foreign, 25,543 German; 1892, 278,796.

BUFFALO BUG. See CARPET BUG.

BUFFALO'RA, a small t. of Lombardy, about 25 m. n.n.w. of Pavia, on the Ticino, here crossed by a bridge. The Austrians commenced the Italian campaign of 1859 by entering Piedmont at this point. The bridge was partially blown up by Austrian engineers. Pop. 1250.

BUFFER, BUFFING APPARATUS, an arrangement like a cushion or plate projecting from the frame of a railway carriage. Buffers are fastened by rods to a spring of flat steel plates, in pairs at each end of the carriage under the framework, to deaden the effect of the concussions caused when the velocity of a part of the train is checked. The buffers, rods, and springs taken together are sometimes called the *Buffing apparatus*, or *Buffing arrangement*. It also allows the engine, in starting a train, to overcome the inertia of the several cars successively. See VESTIBULED TRAINS.

BUFFET, an article of furniture formerly serving the same purpose as a sideboard, which has now superseded it. B. is the name given in France to a refreshment bar.

BUFFIER, CLAUDE, 1661-1737; a French psychologist and metaphysician, for the most of his life a lecturer in the Jesuit college in Paris. His best-known work is *Traité des Vérités Premières*, in which he intended to discover the ultimate principles upon which all knowledge is based. He wrote also on the elements of metaphysics.

BUFF LEATHER is usually made out of salted and dried South American light ox and cowhides. After being limed, they are unhaired and rounded. The grain and flesh are scraped or cut off, and the true cuticle alone remains. The hide is next heated with cod oil and stocked, then partially dried, then oiled and stocked again; the work occu-

pying about a week. The hide is then "heated off" in a stove, then scoured and soaked in lye of carbonate of potash to abstract the oil. It is again stocked, dried, and "grounded" or rubbed smooth with a round knife and with pumice-stone and sand. P. leather is very pliant, is not liable to crack or rot, and is used for soldiers' belts, etc. The natural color of the leather is light-yellow, but it is sometimes bleached white.

BUFFO. See **BUFFOON**.

BUFFON, GEORGE LOUIS LECLERC, Comte de, one of the most famous naturalists and writers of the 18th c., was b. at Montbard, in Burgundy, Sept. 7, 1707. He studied law at the college of Jesuits at Dijon, but showed so marked a predilection for astronomy and mathematics, that his father allowed him to follow his own inclinations. At Dijon, he became acquainted with lord Kingston, whose tutor, a man of learning and taste, directed the mind of B. to the study of the sciences. With lord Kingston and his tutor, B. traveled through France and Italy, and came to England, where, to improve his knowledge of our language, he translated Newton's *Fluxions* and Hales' *Vegetable Statics*. In 1733, he wrote several original essays, which gained notice in the academy, of which he had been made a member. His general love of science received a definite impulse toward zoology by his appointment, in 1739, as intendant of the royal garden and museum. Hitherto zoology, consisting of a series of unconnected observations and fruitless attempts at classification, had been commonly regarded by educated readers as a dry study, and by savans as play-work. B. first conceived the idea of making it attractive to the first of these classes, and of securing for it, at the same time, the respect of the second. His plan was assuredly comprehensive enough, since he aimed at nothing less than a collection of all the separate known facts of physical investigation, and a systematic arrangement of these, to assist the author in forming a theory of nature; but B. possessed neither the science nor the patience necessary for such a task. Endowed, however, with a brilliantly rhetorical imagination, and always inclined to deliver himself from doubts and ignorance by sparkling hypotheses, the elaboration of which cost him little trouble, he contrived to produce a work which, if not severely scientific in its method, at least shone with what many then conceived to be the brightest literary luster. However, it is not to be denied that many of his views are very ingenious, although later researches have completely exploded them. The *Natural History* of B. made an epoch in the study of the natural sciences, though it has now little or no scientific value. His attempted explanations of natural phenomena were opposed by Condillac, who, with Helvetius, Diderot, D'Alembert, and others, also ridiculed, with a certain degree of justice, the excessive pomp of style used by Buffon. The most insignificant part of B.'s treatise is the mineralogy, for which he was quite unqualified by the deficiencies of his chemical, mathematical, and physical knowledge. The systematic and anatomical arrangement of the mammalia was executed by Daubenton, the colleague of Buffon. B.'s works passed through numerous editions, and several were translated into most of the languages of Europe. The best complete edition is the *Histoire Naturelle Générale et Particulière*, in 36 volumes (Par. 1749-88.) After receiving several high honors, being elevated to the rank of comte de B. by Louis XV., and treated with great distinction by Louis XVI., B. died in Paris, April 16, 1788. In person and carriage, B. was noble; as a Parisian academician, and a self-complacent, theoretical naturalist, dressed in courtly style, pursuing his pleasant studies in the *allées* of the royal garden, and largely participating in the vices of his time, B. was quite a model of a French philosopher of the 18th century. His son, Henri Leclerc, comte de B., b. 1764, was attached, at the outbreak of the revolution, to the party of the duke of Orleans, and fell under the guillotine. His last words were: *Citoyens, je me nomme Buffon*.

BUFFOON (Fr. *bouffon*), a low jester. The Italian *buffo* (from *buffa*, a farce) is the name given to a comic singer in an opera. In the corrupt Latinity of the middle age, *buffa* meant a slap on the cheek; and in the Italian, *buffare* signifies the puffing of wind through the mouth. It is probably from the favorite trick played by clowns in farces—one swelling out his cheeks with wind, the other slapping them, so as to make a ludicrous explosion—that the terms *buffones* in Latin, *buffoni* in Italian, *bouffons* in French, and in English *buffoon*, were derived. In Italy, the *buffo cantante* is distinct from the *buffo comico*; the former having greater musical talent, and sustaining a more important part, the latter having greater license in jocoseness. The voice of a *buffo cantante* is generally a bass, but sometimes a tenor buffo is introduced.

BUFORD, JOHN, 1826-63; b. Ky.; graduate of West Point, was capt. of dragoons in 1859. In the late civil war he served on the union side, and was one of the most conspicuous and useful of cavalry officers, participating in many engagements, in one of which he was wounded. He rose to maj.gen. of volunteers.

BUFORD, NAPOLEON BONAPARTE, 1807-83; b. Woodford co., Ky.; military officer; graduated at the U. S. military academy, 1827; resigned from the service, but re-entered the Union army, 1861; was brevetted major-general of volunteers, 1865; U. S. commissioner of Indian affairs, 1868; and Union Pacific railroad inspector, 1867-69.

BUG, a name applied to a large family of insects, *cimicidæ*, of the order *hemiptera* (q. v.), sub-order *heteroptera*, and often still further extended in its signification so as to

include the whole of that sub-order, the insects of the section *geocorisæ* being designated land-bugs, and those of the section *hydrocorisæ*, water-bugs, the latter including water-scorpions, boat-flies, etc. All these insects, and particularly the land-bugs, although some of them are radiant in beautiful colors, have a strong resemblance in form and structure to the annoying and disgusting house or bed-bug (*cimex lectularia*). The statement that this insect was introduced into England with timber brought from America to rebuild London after the great fire of 1666, must be rejected as erroneous; for although it appears to have been comparatively rare in England, it was well known in some parts of Europe long before that time, and is mentioned by Dioscorides. The bed B. is destitute of wings—an anomalous peculiarity, as the insects of its order, and even of the same family, are generally furnished with them. The body is very flat, of a somewhat oval form; the whole insect is of a dirty rust color, emits an offensive odor, and is about three sixteenths of an inch in length; the legs are moderately long, and capable of being employed for pretty rapid motion; the antennæ are thread-like and very slender, about half the length of the body; the mouth is formed for suction alone, and is furnished with a sort of proboscis, which is three-jointed, forms a sheath for the true sucker, and when not in use is recurved under the head and thorax. The B. lurks during the day in crevices of walls, of bedsteads, and of other furniture, but is sufficiently active during the night; and when it finds opportunity, sucks blood until it distends itself. It seems, however, to be capable of subsisting long without food. Young bugs resemble their parents in most things, except size and the want of *elytra*, insects of this order not undergoing such marvelous transformations as those of some other orders. The best preventive of bugs in a house is *scrupulous attention to cleanliness*; but where the nuisance exists, it is not easily removed, and various means are employed for this purpose, of which one of the best and safest is thorough washing with spirit of turpentine, although recourse is even had to washing with a solution of corrosive sublimate.—Other species of B. (*cimex*) suck the blood of some of the inferior vertebrate animals, as pigeons, swallows, bats, etc.; but the greater number of insects of the B. family live by sucking the juices of vegetables. A small species (*tingis pyri*), which sucks the leaves of the pear-tree, is very destructive in some parts of Europe, where it is popularly called the *tiger*. Some of these winged wood-bugs or field-bugs are capable of inflicting very painful wounds. Flying-bugs, “enormous and fetid,” are among the pests of India. Night is the time of their activity. Warm countries generally have winged bugs of great size and beauty; but if touched or irritated, they “exhale an odor that, once perceived, is never after forgotten.” A winged B., as large as a cockchafer, lodges in the thatch and roofing of houses in Chili, and sallies forth at night, like the bed B., to suck blood, of which it takes as much as a common leech.—It is worthy of notice that a species of field B. (*acanthosoma grisea*), a native of Britain, is one of the few insects that have yet been observed to show affection and attention to their young. De Geer observed the female of this species, which inhabits the birch-tree, conducting a family of thirty or forty young ones as a hen does her chickens, showing great uneasiness when they seemed to be threatened with danger.

BUG, or Bog. There are two rivers of this name in Russian Poland. The Western B., the largest tributary of the Vistula, rises in Austrian Galicia, and after a course of about 470 English miles, and receiving numerous tributaries, it joins the Vistula at the fortress of Modlin, near Warsaw. It is navigable for a considerable distance. The Eastern B., the Hypanis of the ancients, rises in Podolia, and flows s. into the estuary of the Dnieper. Its length is more than 500 miles. It is navigable for small-craft as far as Wosnessensk. At the junction of the Ingul with the B., stands the city of Nicolaiew.

BUGBEAR. See BROWNIE; GOBLIN.

BUGEAUD, THOMAS ROBERT, was b. at Limoges, France, in 1784. In his 20th year he entered the army as a private. His conspicuous bravery in the Prussian, Polish, and Spanish campaigns gained him rapid promotion. Shortly before the fall of Napoleon, B. was made a col., and in 1815 commanded the advance-guard of the army corps of the Alps. He afterwards retired to his estate, but was called into public life by the July revolution of 1830. He was elected deputy for Perigueux, and gained the esteem of Louis Philippe, who created him a marshal. In 1835, he voted against electoral reforms and universal suffrage, denounced “the tyranny of the press,” and soon contrived to make himself very unpopular. In Dec., 1840, he was appointed governor-general of Algiers. He immediately set about organizing the celebrated irregular force known as the zouaves, and in a few years the French arms were everywhere triumphant over the Arab tribes. The cruelty of some of B.’s proceedings excited strong feelings of reprobation at the time, as well in France as in Europe generally. In 1844, he gained a victory over the emperor of Morocco’s forces at Isly, for which he was created duc d’Isly. In the revolution of Feb., 1848, marshal B. had the command of the army in Paris, and would have dissuaded the king from signing the act of abdication; but panic made such counsel useless. Among all the friends of Louis Philippe, marshal B. seems to have been the only man who preserved firmness and presence of mind. When Louis Napoleon became president, he intrusted the chief command of the army of the Alps to B., who died of cholera in Paris, June 10th, 1849.

BUGENHAGEN, JOHANN, surnamed *Pomeranus*, or Dr. Pommer, one of Luther's chief helpers in the reformation, was b. at Wollin, near Stettin, in Pomerania, 1485; studied at Greifswald, and as early as 1503 became rector of the Treptow academy. There he lived quietly, fulfilling the duties of his office until 1520, when his religious views were changed by reading Luther's little book, *De Captivitate Babylonica*. B. was now seized, as it were, by the zealous spirit of the reformation, and, to avoid the persecutions of the Catholic party, he betook himself to Wittenberg, where his talents procured for him in succession several high positions. B.'s remarkable philological and exegetical powers were of great service to Luther in his translation of the Bible. In 1525, he opened the controversy between Luther and Zwingli by a treatise against the latter, to which Zwingli ably replied. He possessed a superior talent for organization, establishing churches in Brunswick, Hamburg, Lubeck, and Pomerania. In 1537, he was called to Denmark by Christian III. to reform the ecclesiastical establishments of that country. He accomplished this so admirably, that the Danes to this day consider him their reformer. In 1542, he returned to Wittenberg, and continued his energetic efforts to extend the new theology throughout his native land. He died 20th April, 1558. His best work is his *Interpretatio in Librum Psalmorum* (Nürnberg, 1523).

BUGHIS, or BUGIS, a Malay people in the island of Celebes. The merchants of these people do much of the trade of the island and the neighboring seas. Their government is an elective monarchy, the chief ruler being chosen by the nobles and the higher classes. He holds power only during good behavior, and may at any time be voted out of office. The people are represented as being orderly, peaceable, and well behaved; good good workers in iron, copper, cotton, etc.; constructing good houses and durable ships. Their language has been reduced to writing, and they use the common divisions of the year. They also use the magnetic compass and charts. Half a century ago they were represented as cannibals, but they were conquered by the Macassars and compelled to embrace Mohammedanism. In recent years they have settled colonies of their own people in some of the adjacent countries.

BUGLE, *Ajuga*, a genus of plants of the natural order *labiata*, having an irregular corolla, with very short upper lip and trifid lower lip, the stamens protruding. The species are mostly natives of the colder parts of the old world, and several are British. The common B. (*A. reptans*) is abundant in moist pastures and woods. Its flowers are generally blue, but varieties occur with white and purplish flowers, which are often introduced into flower-borders. The Alpine A. (*A. Alpina*) is one of the beautiful flowers of the Swiss Alps.

BUGLOSS, a name popularly applied to many plants of the natural order *boragineæ* (q.v.), as to the species of *anchusa* or alkanet (q.v.), etc. In some botanical works it is confined to the genus *lycopsis*, a genus differing from *anchusa* in little but the curiously curved tube of the corolla, and of which one species, *L. arvensis*, is a common weed in cornfields in Britain. The beautiful genus *echium* is called VIPER'S BUGLOSS.

BUHACH. See PERSIAN POWDER.

BUHLE, JOHANN GOTTLIEB, 1763-1821; a German scholar and historian of philosophy; a graduate of Göttingen; at an early age occupied a professor's chair at Brunswick. Thence he went to Moscow as professor of ancient languages, and on his return to Brunswick took the chair of natural law, which he held during his life. He edited *Aratus*, and a part of *Aristotle*, and wrote a hand-book of history and philosophy, and a useful history of modern philosophy.

BUHL-WORK, or BOOL-WORK, is the name applied to a sort of inlaying of brass scrolls and other ornamental patterns in wood. The name is derived from its inventor, Boule, an Italian cabinet-maker, who settled in France in the reign of Louis XIV. He employed veneers of dark-colored tortoise-shell, inlaid with brass. Cabinets of his manufacture are highly prized, as are also those of his contemporary Reisner, a German, who used a ground of tulip-wood, inlaid with flowers, etc., in darker woods, and varied with margins and bands of light wood, with the grain crossed for contrast. This modification of buhl-work is correctly called Reisner work. For details of the methods of working, see INLAYING and MOSAIC.

BUHREACH, or BHARAICH, a t. of Oude, India, the principal place of a district of the same name. It is in n. lat. 27° 34', e. long. 81° 33'-65 m. n.e. of Lucknow. It is an old town, of considerable size, situated in a pleasant wooded plain, on the left bank of the Sarju. The houses are mostly built of mud and covered with thatch; but the mausoleums, mosques, and residences of merchants are of brick and lime-mortar. North-east of the town is the tomb of Selar, a reputed Mussulman saint, to which there is a great concourse of pilgrims annually in the month of May. Pop. '91, 24,000; of district, 1,000,000.

BUHESTONE, a variety of quartz (q.v.), containing many small empty cells, which give it a peculiar roughness of surface, particularly adapting it for millstones. The name is given without reference to geological relations, but it is *vein quartz*, rather than true *quartz rock*, which ordinarily assumes the character of buhrstone. There are different varieties of B., some of which are more compact, or have smaller cells than others; and those in which the cells are small and very regularly distributed, about equal in diameter

to the spaces between them, the stone being also as hard as rock-crystal, are most esteemed. Good B. is found at Conway in Wales, and at several places in Scotland; but the finest millstones are obtained from the quarries of La Ferté-sous-Jouarre, in the department of Seine-et-Marne, near Paris. A single millstone in one piece of 6 ft. diameter, sells for about \$250, and one formed of several pieces for about \$160. It is not unusual to form millstones of pieces of B. cut into parallelopipeds, like great wedges of soap, and bound together by iron hoops. The stone is found in beds or in detached masses, and the mode of quarrying is peculiar. When the mass is large, it is cut out into the form of a huge cylinder; around this, grooves are cut, at distances of about 18 in., the intended thickness of the millstones; into these grooves wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required.—Millstones are not always made of B., but sometimes of silicious gritstones, of sandstone, and even of granite. B. millstones are extremely durable. They are quarried in New York, Pennsylvania, and North Carolina.

BUIL, BERNARDO, abt. 1450–1520; a Spanish Benedictine monk, in 1493 sent as apostolic vicar to the new world, accompanying Columbus on his second voyage. In 1495, he returned to Spain, and was one of the foremost in pressing charges against the unfortunate discoverer.

BUILDING, the art of erecting or building houses and other edifices, in which several distinct professions are usually and more immediately concerned. At the head of the building-trade is the architect, who is employed to draw plans and make out specifications of the work to be performed. The builder acts ministerially; his duty consists in carrying out the plans put into his hands, according to certain stipulated terms. The profession of the architect demands not only much imaginative power, but great artistic skill, along with a practical knowledge of details. Endeavoring to realize the wishes of his employer, the architect devises what shall be the external effect and interior accommodation of a building, and portrays the whole on paper with rigorous accuracy. Besides general designs to give an idea of the structure and its interior arrangements, he furnishes the working-plans or drawings, which are to guide the different mechanics—masons, joiners, etc.—in their several operations. These services of the architect, of course, involve much thought and labor, and he is therefore under the necessity of employing a staff of assistants, by whom the plans are executed under his orders. The making out of the specifications is a matter of careful study. To perform this part of his duty properly, the architect needs to be acquainted with the qualities of different kinds of materials; such as stone, lime, sand, bricks, wood, iron, etc. A knowledge of the strength of timber is particularly desirable. When the specifications are made out, they and the contract are subscribed by the builder. To insure as far as possible a faithful adherence to the specifications, the architect appoints a “clerk of works” to keep watch over the whole operations, and who is authorized to check any seeming fault. During the whole proceedings, the architect is paramount. For the due execution of his plans, he feels that his professional reputation is at stake; and, accordingly, having involved his responsibility, the employer cannot with propriety interfere to make alterations while the work is in progress. Such is the etiquette of the profession. Should alterations be desirable, they become matter for a fresh agreement among the parties. When the works are finished, the builder hands his account to the architect to be examined and checked. If satisfied of its correctness, he grants a certificate of the fact, and this is the warrant for payment by the employer. The builder having been settled with, the employer now pays the architect’s fee, which closes the transaction. This fee may be one, two, or more per cent on the entire cost of the B., according to local usage or terms agreed on; whatever it is, it covers all charges for advice, plans, and other professional trouble.

Builders undertake work by “contract,” or by “schedule of prices.” If by contract, they engage to execute the whole works for a stipulated sum. If by schedule of prices, they agree to abide by the measurements of valuers appointed by the architect. These valuers go over the works when finished, and, taking an exact account of everything, compare it with the account rendered by the builder; the architect being the ultimate referee. It is exceedingly important, for the sake of an amicable adjustment of accounts, that the builder should adhere scrupulously to the letter of the specifications—i.e., the covenant under which he has become bound. He can justify no departure from the specifications, on the plea that something as good has been given or done, or that he was not checked at the time by the clerk of works. Being explicitly a person employed to do a certain piece of work, in a certain way, he is in no respect entitled to substitute his own notions for those of his employers.

It may happen that a proprietor acts as his own architect, and employs a builder to execute his designs, on the understanding that he is to pay for everything according to a schedule of prices. In many instances, the builder is proprietor as well as architect, and merely carries out his own plans. Such is generally the case in the neighborhood of London, where builders speculate in leasing land and erecting rows of dwellings for sale. This plan is greatly facilitated by the opportunity of buying every article required in house-building ready for use, such as bricks, door-steps, hearthstones, joists, flooring, doors, windows, marble mantel-pieces, slates, etc. In fact, house-building in the metropolitan district is very much reduced to a system of purchasing and putting together

certain articles from manufactories and depots. For this kind of business, there may be said to be establishments for the sale of doors and windows, as there are shops for the sale of nails, locks, and hinges.

The application of a comprehensive manufacturing system in the preparation of various parts of a building is observable most particularly in certain establishments of great magnitude. The test is this—whether the builder conducts so gigantic a trade as to warrant him in setting up a steam-engine of great power, and in providing highly wrought machines for cutting and otherwise treating wood, stone, etc. When once this degree of magnitude is reached, the operations are conducted under very great advantage. The Crystal palace in Hyde park could never have been built at the stipulated cost, nor in the required space of time, but by the application of steam power to work the machines which shaped and grooved the *two hundred miles* of sash bars; by the resources of the largest English establishment in the glass-trade, in making 1,000,000 sq. ft. of sheet-glass; and by the skill and capital of our great iron manufacturers, in rapidly producing 3000 iron columns, and more than that number of iron girders. When the late Mr. Thomas Cubitt was engaged in the vast building operations at Belgravina (a district in the w. of London owned by the marquis of Westminster), his factory on the banks of the Thames was the most complete ever known in the trade. It exemplified both the principles adverted to above—the manufacture of various articles by steam-worked machinery; and the collecting of large stores of other articles made in a similar way by other firms. There was a store of drawing-room and parlor doors, a store of window-sashes, a store of street-doors, and stores of mantel-pieces, stone and marble steps, balusters, slates, knockers, bells, and all the materials for house-building from the coarsest to the finest. There was also observed that systematic gradation of kinds and dimensions which is so much attended to in the higher kinds of machinery, and which so much expedites all operations; seeing that one particular piece would not only fit into or against another, but into or against any one of a whole class to which that other belonged. A house built in this systematic way partakes a good deal in the nature of a large machine, in which all the parts fit together with very great accuracy. There can be little doubt that if skill and capital be judiciously applied in this way, a house ought to be better built and to cost less than if built in the ordinary unsystematic manner. It may also be mentioned here that Mr. Cubitt was the owner of a very large brick-making establishment on the banks of the Medway, between Rochester and Maidstone, where steam-power was employed in all the operations of making bricks. Some of the great railway contractors, who have become millionaires, were originally house-builders, alive to the grand results producible by the combination of steam-worked machinery with the labor of well-organized bodies of men.

As an art, B. is of vast antiquity, and has assumed different forms, according to the necessities of mankind and the materials readily at their disposal. In ancient Egypt, Greece, and Italy, B. in stone rose to a high state of perfection, and till the present day it may be said that the greatest progress in the art is made only where stone of a manageable kind is conveniently at command. Rome, Paris, Lyons (with very many Italian and French cities), Bordeaux, Brussels, Munich, Geneva, Vienna, Edinburgh, and Glasgow are specimens of what may be achieved in stone workable with the chisel; Aberdeen is mainly built of granite. On the other hand, London, the greatest city within the bounds of civilization, is built of brick; so likewise are Manchester and Liverpool; also Amsterdam, Rotterdam, and other towns in Holland; and as a general fact, it would appear that wherever brick has to be resorted to, there the allied arts of architecture and building, as regards domestic accommodation and elegance of style, are on a poor scale. B. with stone of a superior kind has become very common in New York, Philadelphia, and most other American cities. It is not necessary to trace in this article the various processes embraced in the comprehensive term BUILDING; seeing that all the materials used, and all the operations conducted, are noticed under the proper headings in the cyclopædia.

BUILDING ACT FOR LONDON AND ITS NEIGHBORHOOD. See METROPOLIS LOCAL MANAGEMENT ACT.

BUILDING LEASES. In the law of England, a building lease is a demise of land for a long term of years, the lessee covenanting to erect certain houses or edifices thereon, according to specification. By the 19 and 20 Vict. c. 120, amended by the 21 and 22 Vict. c. 77, and which acts also apply to Ireland, the court of chancery is empowered to authorize leases of settled estates and B. L., which shall take effect in possession within one year next after the making of the same; the term for such building lease being 99 years; or where the court shall be satisfied that it is the usual custom of the district, and beneficial to the inheritance to grant B. L., for longer terms, then for such term as the court shall direct. By a subsequent enactment, it is declared that the term building lease shall include a repairing lease, but such repairing lease to be for a term not exceeding 60 years.

By the 5 and 6 Vict. c. 108—passed to enable ecclesiastical persons to grant long leases for building, repairs, or other improvements—it is enacted that any ecclesiastical corporations, aggregate or sole, excepting as mentioned in the act, may, with consent of the *ecclesiastical commissioners for England* (q.v.)—to which, where the lessor is

incumbent of a benefice, the consent of the patron also must be added—demise by deed the corporate lands or houses for any term not exceeding 99 years, to take effect in possession and not in reversion, to any person willing to improve or repair the same; provided that on the grant of such leases, a small rent may be reserved during the six first years, with an increased rent afterwards; but no such lease is to comprise the usual house of residence, its out-buildings, or pleasure grounds. While there is nothing in the law of the U. S. to prevent building leases, their use is very infrequent. Lands are frequently leased for purposes of building, and even for as long terms as 99 years, but there is almost invariably a clause in the lease providing that when the term shall have expired it may be renewed by the lessee or his assigns at their option. In such case it is usually provided that the amount of the rent to be paid for the new term shall be a certain per cent. of the value of the property. If the lessee or lessor do not wish to renew the lease then one or the other shall sell, the landlord having his option. The values in such case to be ascertained by three disinterested real estate owners of the vicinity. These provisions, of course, vary in different communities, and may in any instance be whatever may be agreed upon by the parties. See LEASE, LEASEHOLD, and GROUND-RENT.

BUILDING SOCIETIES. See BENEFIT SOCIETIES ; CO-OPERATION.

BUILDING STONE. The chemical composition of B. S. varies. The majority of kinds are more or less silicious, and are designated sandstones. These consist of particles of sand, united together by the force of cohesion, and by a small proportion of a natural cement; in some cases, ferruginous, consisting of a compound of iron; and in other instances, calcareous, composed of carbonate of lime. Igneous rocks furnish very durable B. S., though in general the hardness of the materials renders them so difficult to work, that they are seldom resorted to where softer stones can be procured. Thus, granite is largely employed in the construction of the houses in Aberdeen, in the erection of bridges, in the paving of streets, and wherever great durability is required. Greenstone and basalt are also occasionally used. The B. S. employed in the new houses of parliament is a magnesian limestone, or a double carbonate of lime and magnesia, which is very close and compact in texture, and is soft enough to be easily cut with the chisel; unhappily it has not proved firm enough to resist weathering, having already shown signs of decay. The other forms of carbonate of lime exhibit considerable durability. Near Bath and in the isle of Portland, an oolitic limestone is quarried, which is easily cut, and stands well.

A very convenient and accurate way of determining the durability of a B. S.—in other words, its power of resisting the effects of frost and other atmospheric agencies—is to place a small block in a cold saturated solution of sulphate of soda; raise to the boiling-point, so as to expel air from cavities in the stone, which then become filled with the solution; then allow to cool, and suspend the block of B. S. in air. Every now and then, it is dipped into the solution, and subsequently air-dried. The result is, that the sulphate of soda crystallizes on the outside and partially in the interior of the block, and in this respect acts as water does when it is frozen during winter; and if the B. S. be porous, and liable to decay by natural agencies, it gradually breaks up, and particles scale off. The amount of this corrosion can be determined by weighing the detached portions. Some building stones contain iron pyrites in little nodules diffused here and there throughout the mass, and such become discolored from the pyrites being decomposed by atmospheric influence, and the brownish-red oxide of iron (rust) is left as a stain on the surface of the block. The liability to decay or to discoloration in a B. S. may be arrested to a great extent by coating the outer surface with boiled linseed-oil, which communicates a dark appearance to the stone, but prevents oxygen or moisture from gaining access to the block. Ordinary oil-paint is employed for the same purpose. for the preservation of B. S. from decay by means of various solutions, see STONE, PRESERVATION OF. See Gillmore's *The Strength of the Building Stone of the United States* (1874).

BUITENZORG, a t. in Java, 66 m. s. of Batavia, with which it has railway communication. It is in a fine situation, 800 ft. above the sea, and is a favorite residence for Batavia's rich men. The country palace of the governor-general is one of the chief buildings, and there are a mansion for the regent, a garrison church, and mosques. The botanical gardens, laid out in 1817, are among the best in the world. In the neighborhood is a sacred forest held in great veneration by the natives.

BUJALANCE, a city of Andalusia, Spain, about 20 m. e. of Cordova. It is surrounded by a moat and a wall flanked with old towers, has an old Arab castle, and manufactures of woollens, glass, and pottery, exports of agricultural produce, and an important annual cattle-fair. Pop. about 10,500.

BUKKUM WOOD. See BRAZIL WOOD and SAPAN WOOD.

BUKKUR, a fortified island of the Indus, in Sinde, in lat. 27° 39' n., and long. 68° 56' e. It is 400 yards from Roree, on the left bank, and 100 from Sukkur on the right. In the ordinary state of low water, the western and eastern arms of the river are respectively 15 ft. and 30 ft. deep. In particularly dry seasons, however, the former has been known to disappear altogether, and even the latter is said to have occasionally been

fordable. In 1839, a British force, on its march to Afghanistan, made a stepping-stone, as it were, of B. in crossing the Indus, having joined it to either mainland by a bridge of boats. B. is no longer of any military value against a civilized assailant, commanded, as it is, on both sides by higher grounds. It is composed of limestone, being 800 yards long, and 300 broad, and rising 30 ft. from the average level of the stream.

BUKOWINA, a duchy in the Cis-Leithan (non-Hungarian) section of the Austrian empire, on the Russian frontier; area, 4035 sq.m.; pop. '90, 646,591 (of whom the leading nationalities are Ruthenians and Roumanians). It has a local Diet of 31 members, and sends 9 members to the Reichsrath, being one member for every 71,843 inhabitants. The leading religion is the Greek. It became a "crown land" in 1849, having previously formed a part of Galicia. It is traversed by offsets of the Carpathians, gives rise to many rivers, and abounds in wood, along with considerable mineral riches. Wood-cutting and mining afford occupation for a great number of the inhabitants. Large numbers of cattle are reared, and also excellent horses. B., till the end of the 15th c., belonged to Transylvania, when it came under the dominion of the Turks, from whom it was acquired by Austria in 1775. Czernowitz is the chief town.

BULACAN, a t. of Luzon, Philippines, at the head of the bay of Manila, about 20 m. n.w. of the city of that name. B. is chiefly composed of wooden houses, but has spacious streets, manufactures of silken mats and other fabrics, and large sugar-boiling establishments. Pop. about 12,000.

BULAMA, the most easterly of the Bissagos islands off the w. coast of Africa; 11° 34' n., 15° 33' w.; 18 by 9 m.; fertile and heavy wooded, but insalubrious. There is a good harbor. An English colony was sent here in 1792, but nearly all soon fell victims to the climate.

BULAU, or *Tikus Gymnura rafflesii*, vig., an animal in Sumatra, of the mole family resembling the opossum. The body is 12 to 14 in. and the tail 9 or 10 in. long. It is about 5 in. high at the shoulder; color black and white, with a black stripe over each eye; the fur mixed with long bristly hairs, and tail nearly naked. It feeds on insects, and secretes a strong odor of musk.

BULB, in botany, a subterranean bud covered with imbricated scales, having at their base a flattened disk, which represents the proper stem of the plant, and from which the roots proceed downwards, whilst from the midst of the scales an annual herbaceous stem and leaves are sent up. The scales are regarded as modified leaves, and sometimes are all fleshy, as in the lily; sometimes the outer ones are membranous, as in the onion, in which case the B. is said to be *tunicated*. The B. is popularly but erroneously regarded as the root or part of the root of the plant, and plants in which it is found are very generally described as *bulbous-rooted*. New buds are formed in the axils of its scales, which grow at the expense of the parent B., and gradually destroy it. In some plants, as the tiger-lily and some species of allium, leaf-buds (*bulbils* or *bulblets*) are developed on the stem above-ground, which spontaneously separate and serve for the propagation of the plant, and which are entirely of the nature of bulbs, being formed of thickened scales, sometimes so closely united as to form a solid mass. The CORM (q.v.) was formerly regarded as a kind of B., and described as a solid B., but its structure is essentially different, although both it and the TUBER (q.v.) may be included in the description which Linneus has given of the B. with reference to the purpose which it serves as "the winter-quarters of the plant." Many bulbs, if removed from the ground during the period when the vegetation of the plant is most dormant, may be kept in a dry place without injury for a considerable time, even for years. Bulbs serve also for the preservation of plants in periods of drought, and are particularly frequent in those which delight in sandy soils. The abundance of "bulbous-rooted" plants is a remarkable characteristic of the flora of the Cape of Good Hope. "Bulbous-rooted" plants are very often distinguished by the beauty of their flowers, and many of them are among the most esteemed ornaments of gardens, greenhouses, and stoves. The bulbs of tulips, hyacinths, and other favorite flowers are important articles of trade. Some bulbs, as that of the onion, are valuable as articles of food; others, as that of the squill, from their medicinal properties.

BULBUL, a Turkish name for the nightingale, which has found its way into English poetry chiefly through the patronage of lord Byron. But the same name is given in India to a very different bird, *pyenonotus hemorrhous*, belonging to the great tribe of *dentirostres*, and formerly ranked among the thrushes, to which it is pretty nearly allied. It is a little bird of brilliant plumage, and the male has a crest or tuft on its head. It is remarkable for its pugnacity; the Singhalese consider it the most game of all birds.

BULGARIA, an autonomous principality, tributary to Turkey, which till 1878 constituted the Turkish vilayet of the Danube (Tuna). B. is bounded on the n. by the Danube and the Dobrukscha, now Roumanian; on the e. it has the Black Sea; on the s. the Balkan range; and on the w., Servia and Roumelia. According to a census taken on Jan. 1, 1893, there were 3,309,816 inhabitants, of whom 2,504,336 were Bulgarians, 569,228 Turks, and the remainder in order of numerical importance, Greeks, gypsies, Jews, Germans, and Russians. The area of B. is 24,360 sq. miles. The country slopes terrace-

like from s. to n., and from the w. to the e., acquiring a plain-like character before reaching the Black sea. The rivers are rapid and tributary to the Danube. The soil in some parts is very fertile, producing great abundance of corn; in others, it does not yield sufficient for the consumption. There is excellent pasture-land, and the lower terraces are richly wooded. The chief crop is wheat, which is largely exported. Other exports are wool, tallow, butter, cheese, hides, live stock, flax, and timber. The inhabitants are hard-working, hospitable, and fairly intelligent, but suspicious and greedy; the faith of 70 per cent. that of the Greek church. The prince, freely elected by the people, must be confirmed by the porte with the assent of the powers. The government is Christian, and there is a national militia. The Berlin congress decided that the military importance of B. should meanwhile be decreased by the demolition of all its fortresses. Sofia (pop. 1893, 47,000) is the capital.

The earliest known inhabitants of B. were the Mæsians, who contended long against the Romans, and allied themselves with Gothic and Slavonic tribes against the Greek empire. Anastasius, the Greek emperor, in 507, built an extensive wall to defend his territories from Mæsiian invaders. In the 7th c., the Bulgarians, a people of Finnish origin, whose original seat was the banks of the Volga, conquered the Mæsians, and established the kingdom of Bulgaria; they soon lost their own language and customs, and became assimilated to the other Slavonic inhabitants. After being tributary to the Greek emperors, and contending for some time against Hungary, B. became subject to the Porte in 1392; but the frightful oppression of despotic and sanguinary pashas has not, even to the present day, robbed the inhabitants of a distinctively national life and love of freedom. In April, 1876, an insurrection broke prematurely out in B., and was quenched in blood, the bashi-bazouks or Turkish irregulars committing savage excesses. The atrocities in B., taken in connection with the Servian war and the condition of other Christian provinces of Turkey, led to diplomatic intervention; and in December a conference met at Constantinople, but without result. The war of 1877-78, between Russia and Turkey, followed. The congress of Berlin, which revised the treaty of San Stefano, declined to sanction the erection of a Bulgarian principality extending from the Danube to the Ægean. But it constituted an autonomous, though tributary, Bulgaria n. of the Balkans, and to the mainly Bulgarian province s. of them, that of eastern Roumelia (q.v.), it granted administrative autonomy. In 1879 Alexander of Battenburg, a minor German prince, was made sovereign. In Sept., 1885, an independent revolution in eastern Roumelia united that country with Bulgaria. Servia claimed that the Berlin treaty had been violated; and her jealousy of B. led her to invade the latter's territory. After a brief war, an armistice was declared; a conference of the great powers followed, and the Porte consented to the temporary union of B. and eastern Roumelia. In 1886 Alexander was forced by Russia to abdicate, and in the summer of 1887 prince Ferdinand of Saxe-Coburg, against the will of the great powers (especially of Russia), accepted an invitation by the regency to fill the vacant throne. See Dicey, *The Peasant State* (1894).

BULGARIAN LANGUAGE, the richest of the old Slavic tongues, used by the Græco-Slavic church, and the chief medium of religious writings in that region. After the fall of the Bulgarian kingdom, about 1400 A.D., the language became mixed with neighboring dialects and lost its purity. In the older literature are found translations of the Bible made in the 10th century. The literature of the present time is of small account, being only such as is found in elementary and doctrinal works. Grammars and dictionaries have been published since 1835, and a New Testament was issued in 1840 for the British and foreign Bible society. The language lives in many native songs.

BULGARIAN POLITICAL PARTIES. See **POLITICAL PARTIES, BULGARIAN.**

BULGARIN, THADDEUS, a Russian author, was b. in Lithuania, 1789; fought in the campaign against France, but afterwards served under Napoleon. On Napoleon's fall, he devoted himself to literature. He wrote both in Polish and Russian; and ultimately settling in St. Petersburg, became a popular author. He composed several romances—of which *Demetrius* and *Mazeppa* are the best—and published different periodicals. He died in 1859.

BULGARUS, the most celebrated of the famous "four doctors" of the law school of Bologna. He was a native of that city, and was regarded as the Chrysostom of the gloss writers. He lived to a great age, becoming childish before his death in 1166. B. was one of the most trusted advisers of the emperor Frederick I. The commentary *De Regulis Juris* is his most celebrated work.

BULIMY, OR BOULIMY (Gk. *bous*, ox; *limos*, hunger), a form of disease, chiefly occurring among idiots and maniacs, in which the patient has a perpetual and insatiable desire for food, and often faints if his appetite be not indulged. The disease is also known as *canine hunger*, and is due sometimes to a very irritable state of the nerves of the stomach.

BULKHEADS, in a ship, are the partitions between the several portions of the interior; whether to separate it into rooms, or as a safeguard in case of wreck.

Water-tight B. are among the improvements in modern ship-building; they are iron walls running athwart the hold, as a means of dividing it into several portions; the interior is thus cut off into cells, each water-tight in reference to its neighbors. When such

a ship is leaking in any one of the compartments, there is thus a chance that the others may be kept dry until the damage is repaired. In iron steamships the water-tight B. are generally placed transversely, but there are frequently longitudinal water-tight divisions also. The number and disposition of the compartments depends on the ship-owner and the ship-builder; but it is now the common practice to place the engines and boilers in water-tight sections, and experience has proved the special value of a collision-bulkhead in the bow.

BULKLEY, PETER, 1583-1659; b. England; the earliest minister in Concord, Mass. He was his father's successor at Woodhull, England, but was removed for non-conformity, and in 1635, with a number of other emigrants, founded the Concord settlement. He wrote several Latin poems, and a work called *The Gospel Covenant Opened*.

BULL (Lat. *bulła*, primarily, anything round or swelling) was originally the name of the capsule of the seal appended to letters from emperors or from the pope. Afterwards, the word was applied to the seal, and next to the document itself, as in the case of the celebrated golden bull of the emperor Charles IV., which was so named from the golden capsule appended to imperial letters and other important documents by the Byzantine and Frank emperors as early as the 9th century. They are issued by the apostolic chancellor, and are dated "from the day of incarnation," whereas briefs are always dated "from the day of the nativity." The name is now applied exclusively to letters or documents issued in the name of the pope. In cases of granting favors, etc., the seal is appended to the open letter by a yellow or red band of silk; but in the administration of justice, a gray hempen band is used. All bulls, excepting those addressed to the united Greek Christians, are written in Latin with Gothic letters, and on the rough side of the parchment. See **BRIEF**. All bear the name and title of the pope—for example, *Gregorius Episcopus Servus Servorum Dei*, etc., is prefixed; then follows a general introduction, of which the initial words are used to give a distinct name to the B., as in the examples: the B. *Ersurge Domine*, issued by pope Leo X. against Luther in 1520; the B. *In Cena Domini*, the celebrated B. against heretics, often reissued since 1536; the famous *Unigenitus*, or B. against Quesnel's writings, 1713; the *Dominus ac Redemptor Noster*, or B. for the abolition of the order of Jesuits; the *Ecclesia Christi*, or the B. which completed the concordat with France in 1801; the *De Salute Animarum*, or the B. for the regulation of the Catholic church in Prussia. To every B., the leaden seal of the church is appended, bearing on the obverse the arms of the pope, and on the reverse his name. Bulls issued during the interim between the election and consecration of a pope have no armorial bearings on the seal. A *bullarium* is a collection of papal bulls, as the *Bullarium Magnum Romanum a Leone Magno ad Benedictum XIII.* (19 vols., Luxembourg, 1727-58), the *B. Romanum* (28 vols., Rome, 1737-44), and the *B. Benedicti XIV.* (Mechlin, 1826-27), and more recently, the continuation of the *Bullarium Magnum* by Barberini (Vienna, 1835).—From the same mediæval Latin word *bulła* is derived the word *bulletin* (Ital. *bulletino*), commonly applied to dispatches from generals, reports of the health of royal personages, and on the continent, at least, to other brief authenticated documents, such as those of scientific societies, the best known of which are the bulletins of the St. Petersburg and Belgic academies. It is, moreover, used as a title for periodicals, and, in France, also designates the slips of paper on which electors write their votes.

BULL, a ludicrous and unintentional blunder in speech due to the conjunction of contradictory or incompatible ideas. Some would trace the origin of the term to the papal bulls, in which the pope styles himself "the servant of servants," but claims absolute authority over the world. Coleridge, in remarking on the subject, instances the following: "I was a fine child, but they changed me." The Irish are noted for their bulls. See Edgeworth, *An Essay on Irish Bulls*.

BULL. See **Ox**.

BULL, GEORGE, D.D., a learned prelate and theological writer, b. at Wells, Gloucestershire, England, Mar. 25, 1634; studied at Oxford, whence he retired in 1649, having refused to take the commonwealth oath imposed by the parliament. Receiving holy orders, his first charge was the parish of St. George's, Bristol. In 1658, he obtained the rectory of Suddington St. Mary's, near that city; and in 1662, was presented to the vicarage of Suddington St. Peter's. In 1669, he published his *Harmonia Apostolica*, the object of which was to reconcile the apostles Paul and James on the subject of justification. This work occasioned considerable controversy among divines, and in answer, B. published his *Examen Censuræ*, and *Apologia pro Harmonia*. In 1678, he was presented to a prebend in Gloucester cathedral, and made rector of Avening, Gloucestershire. In 1679, he was installed archdeacon of Llandaff, and received the degree of D.D. from Oxford University. In 1685, he published his *Defensio Fidei Nicenæ*, against the Arians and Socinians, Tritheists and Sabellians; and in 1694, his *Judicium Ecclesiæ Catholice*, for which the thanks of the whole French clergy were sent to him through the celebrated Bossuet. His last work was his *Primitive and Apostolical Tradition*, etc. He was consecrated bishop of St. Davids in 1705, and died Feb. 17, 1710.

BULL, JOHN, 1563-1628; an English organist and composer. He was appointed organist in the queen's chapel in 1591, and next year made doctor of music in Gresham

college. Not understanding Latin, he was especially permitted to lecture in English. He visited the continent, and had many offers of honorable and lucrative positions, but declined all, returning to England to be organist to James I. On another visit to the continent he became organist to the cathedral in Antwerp, where he died. The claim that he composed the English national anthem has not been sustained.

BULL, JOHN, a familiar synonym for the English people. Its origin is attributed to Dean Swift, but Arbuthnot first gave it literary currency in his *History of John Bull* (1712), a political allegory intended to satirize the duke of Marlborough, and to increase feeling against the war with France. In art John Bull is well known as a burly country squire, impetuous, honest, narrow-minded, dogmatic, and easily imposed upon.

BULL, OLE BORNEMANN, a famous violinist, b. in Bergen, Norway, Feb. 5, 1810; d. near there, Aug. 17, 1880. His father, it is said, attempted to force him into the study of theology, and would not permit a musical instrument about the house. This foolish treatment only gave a more decisive character to the peculiar genius of the boy. At the age of 18 he was placed at the university of Christiania, from which he is said to have been expelled for taking temporary charge of the orchestra at one of the theatres. In 1829, he went to Cassel, in Germany, to study under Spohr, but was so coldly received that he devoted himself to the study of law at Göttingen. He was subsequently at Minden, whence, in consequence of a duel, he fled to Paris in 1831. An unsuccessful attempt to drown himself in the Seine was the turning-point in his life. He thereafter acquired the patronage of a lady of rank, and rapidly rose to fame as a violinist. His style of playing was like that of Paganini, who spoke of his technique as masterful. In 1836, he visited England, Scotland, and Ireland, and subsequently traveled in a professional capacity through Belgium, Holland, Russia, and Germany. In 1843 he went to the United States, and became attached to that country. Returning to Norway, his American ideas offended the government, resulting in many lawsuits and the dissipation of his wealth. In 1852 he returned to the United States, and put into practice a scheme long contemplated, which, like most of his business speculations, resulted disastrously. He purchased 120,000 acres of land in Pennsylvania, and attempted to found there a colony of his countrymen. He designed a castle for his permanent home, and erected it on the summit of a mountain, from which there was a commanding view. Before the castle was completed the colonists grew discontented, and about the same time he learned that the title to the land which he had purchased was worthless. Ole Bull relinquished everything, and again had recourse to his violin to repair his bankrupt fortunes. All that remains as a reminder of his grand scheme is the village of Oleana, named after him, which clusters around the base of the mountain capped by the once lordly castle known to this day as "Ole Bull's Folly." After a profitable European tour, he returned to this country, and made his home in Cambridge, Mass. In 1870, he made a happy marriage with a Wisconsin lady. His form was tall and erect, even to old age. Longfellow describes him in his *Tales of the Wayside Inn*. He was gifted with remarkable memory and with social qualities by which he made and retained many friends. On his seventieth birthday, which occurred in Feb., 1880, a surprise party was given in his honor at his home in Cambridge, at which many literary celebrities of the vicinity were present. He was then, to all appearances, strong and healthy. Early in the summer he sailed for his summer residence in Norway, where he died.

He belonged to no school in music, but Mozart was the composer that he cared most to interpret. Joachim criticizes him thus: "No artist in our time has possessed Ole Bull's poetic power; no one has ever surpassed his playing of the adagio." His own compositions and improvisations best exhibited his mastery over his instrument, and were always demanded by the audience. His works include: a Concerto in A (1832); do. in E minor (1841); Quartetto a violino solo (1834); and *Memory of Washington* (1841). See Sara C. Bull, *Ole Bull: A Memoir* (Boston, 1883).

BULLA, a genus of mollusca, which in the older systems, founded upon characters taken from the shell alone, contained a heterogeneous assemblage of species essentially very different. Some of those having been removed to other orders, according to their organization, the genus *bulla*, and the family *bullidae*, of which it is the type, are placed in the order *tektibranchiata* of Cuvier, an order of the class *gasteropoda* (q.v.), and of that section of it called *monocera*, having the male and female organs of sex combined in the same individual. The *bullidae* have a convoluted and generally thin shell, which serves as a covering and protection for the gills, and which in some of them is large enough to form a retreat for the entire animal, in others is itself enveloped in the mantle. This shell forms a sort of transition link between the flat calcareous plate inclosed in the mantles of the *aplysia* or sea-hares—to which B. is nearly allied—and the spiral shell of snails and other such conchiferous mollusks. The mouth of the shell is large, extending the whole length of the shell, widening towards one end, the lip acute. The gizzard of the *bullidae* is very muscular; and among its thick coats, in many species, are found calcareous bony plates, which being moved against each other by its muscles, serve to grind down the food. All the species are marine, some are found on the British coast. Some, from their form and fragility, are popularly called BUBBLE SHELLS, as the British *bulla hydatis*.

BULLACE, *Prunus insititia*, a shrub or small tree, larger and much less spiny than the sloe, but very closely allied to it, as it is also to the plum, so that many botanists

regard them all as one species, an opinion much confirmed by the circumstance that the varieties pass into each other by imperceptible gradations. The B. may be regarded as a form intermediate between the plum and the sloe. Its leaves, however, are generally broader in proportion to their length than those of either of these, and its fruit-stalks more frequently in pairs; it differs also from both of them in its downy fruit-stalks, and in having the under side of its leaves permanently downy. The flowers are rather larger than even those of the plum; the fruit is larger than the sloe, generally globose, and, although it partakes in some degree both of the acidity and the roughness of the sloe, it is not unpleasant, especially after having been mellowed by frosts, and makes excellent pies or tarts. "A bullace-pie is a standing dish at the harvest-home supper in the south of England, only it requires rather more sugar than the housewife is always willing to allow." The B. is common in hedges, coppices, and banks in England, and in many parts of Europe.

BULLE are collections of serous fluids of considerable size, situated immediately beneath the cuticle, and rising from the true skin. They differ from vesicles only in size; and no very definite line can be drawn between a large vesicle and a small bulla. They usually vary in diameter from a quarter of an inch to two inches. They may be followed by crusts or by ulcerations. They constitute a special order of skin-diseases, which includes pemphigus and rupia (q.v.).

BULLAS, a t. of Spain, in the province of Murcia, and 26 m. w.n.w. of the town of Murcia. It is situated on a hill, 1840 ft. above the sea. The streets are steep and unpaved. B. has manufactures of linen and hempen fabrics, earthenware, and brandy, and a considerable trade in manufactured goods and grain. Pop. 6700.

BULL-BAITING, a barbarous sport, once very popular in England, and in which all classes of society equally delighted, but now, through the progress of civilization, almost entirely confined to the lowest, and rare even among them. It consists in causing a bull to be attacked by dogs; and, in order that the bull might be made as furious as possible, his nose was sometimes blown full of beaten pepper before he was turned loose. Another form of this sport was to fasten the bull to a stake, by a rope of some yards long, and to send bull-dogs against him, one at a time, which were trained to seize him by the nose, and, when this was accomplished, it was called *pinning* the bull. But no small part of the enjoyment of the spectators was derived from the success with which the attacks of the dogs were met by the bull lowering his head to the ground, and receiving them on his horns, often tossing them to a great distance. In some places, bull-baiting took place regularly as a sort of annual festival, and funds were sometimes left to provide for it. King James I. of England greatly delighted in this sport. When the late emperor Nicholas of Russia visited England, before his accession to the empire, he was present at a boxing-match and a bull-baiting, which were got up to show him English tastes.

An equally barbarous sport, termed *bull-running*, was formerly practiced at Stamford and Tutbury, where men and women took the place of dogs, maddened the bull with hideous noise, and then pursued it with "bull-clubs," till it expired.

BULL-DOG, a kind of dog which is regarded as peculiarly English, but concerning which it is doubted whether it has existed as a distinct race, at least from the Roman era, or has more recently sprung up, as a variety of the mastiff, or a cross between the mastiff and some other breed. Buffon, indeed, represents the bull-dog as the parent race, and the mastiff as derived from it, but this opinion is generally rejected as erroneous. The bull-dog has been regarded as a distinct species by some naturalists, and named *canis Anglicus*, *C. lanianus*, etc. It is much smaller than the mastiff, but is very strong and muscular. The breadth of muzzle is greater than in the mastiff, and the head is very large, almost appearing as of disproportionate size to the body. "The forehead sinks between the eyes, and the line of the nose rises again at a considerable angle; the lower jaw projects beyond the upper, often showing the teeth, which altogether, with the frequent redness about the eyelids, produces a most forbidding aspect; the ears are partially drooping, unless the terrier blood is crossed in the animal, and the tail is carried high." The hair is short, and the tail taper, and not bushy. The color may be ochry or reddish buff, brindled, fawn, or white, the last being preferred, and should be whole or unmixed, though dogs of two colors are exceedingly common. The bull-dog used seldom to be seen except in the company of persons who delight in dog-fighting and other barbarous sports, but now has sometimes more reputable patrons. It was formerly much employed in bull-baiting, from which it derives its name. It is chiefly remarkable for its savage ferocity, and the pertinacity with which it retains its hold, as if its jaws were locked, and it could not let go. It will hang to the jaw or nose of a bull, although lifted from the ground. Col. Hamilton Smith says he has seen one "pinning an American bison, and holding his nose down, till the animal gradually brought forward its hind feet, and, crushing the dog to death, tore his muzzle out of the fangs, most dreadfully mangled." The bull-dog is also bold enough to attack any animal, however superior in size and strength. See illus., HORSES, DOGS, and RABBITS, vol. VII., fig. 13.

The **BULL-TERRIER** is a cross between the bull-dog and the terrier. It is smaller than the bull-dog, more lively and docile, and equally courageous. The ears are always

pointed; the best color is white, with some black about the head. It is unrivaled in rat-catching. It is a great favorite as the companion of young men.

BULLDOZING, a word which first came into general use in 1876, from the local *argot* of Baton Rouge, Louisiana, originally denoting the conduct of a sort of vigilance committee which undertook to prevent the stealing of cattle and stock. The offenders when caught were punished with a dozen lashes from a bull-whip. Hence, the first form of the word was *bull-dozen*. The name soon received an extension of meaning by which it characterized all summary punishment inflicted without due process of law, especially for the purpose of political intimidation. See Norton's *Political Americanisms* (1890).

BULLER, CHARLES, 1806-48, English politician, entered parliament before the reform bill and continued a member of the lower house till his death. He was still but a rising man when he died. In politics, a philosophical radical, he occupied successively the posts of judge-advocate general and president of the poor-law commission under whig governments.

BULLER, Gen. Sir REDVERS HENRY, English military officer, b. 1839, fought through the Ashantee, Kafir and Zulu campaigns, winning the Victoria cross in the last named for the gallant rescue of a comrade. Later he served in the Boer war of 1881, in the Egyptian war of 1882, and in the Soudan campaign of 1884-5. From 1887 to 1890 he was quarter-master-gen., and in 1891 promoted to the rank of lieutenant-gen.

BULLET is the leaden projectile discharged from a musket, fowling-piece, pistol, or similar weapon. When the smooth-bore muskets alone were used by British infantry, the bullets were made by casting. Molten lead was poured into molds; and the molds were dipped in cold water, to hasten the solidification of the lead. The molds were cooled after every few times of using; and the lead was heated only just to the degree for maintaining fluidity. Bullets are now, however, made more expeditiously, and more truly spherical in form, by compressing machines, one form of which has been invented by Mr. George Napier. The lead is first fashioned into a rod about a yard long, by five or six eighths of an inch thick; this rod is passed between rollers to condense it; then between other rollers to press it into a row of nearly globular pieces; then a spherical die gives the proper form to each of these pieces; and, lastly, a treadle-worked punch separates them into bullets. With one of these machines and two dies, nine boys can make 40,000 bullets in a day.

Since smooth-bore musketry has given way to rifled arms, the old spherical bullet has been replaced by various forms of elongated projectiles. Many have a base arranged for expansion, being hollow or plugged, with the object in view of forcing the soft lead to spread sufficiently to fit the rifle-grooves and thus to impart to the bullet itself a rotary motion, with the consequent increase in precision and in length of range. Their forms are singularly numerous. Robins' bullet was egg-shaped, with the centre of gravity at the larger end; Beaufoy's was ovoid, with a hemispherical cavity at one end; Manton's was a spherical ball put into a wooden cup, with projections on the exterior; Greener's was oval, with a plug of mixed metal driven into a hole barely large enough for it; Norton's, Delvigne's, Minié's and others, are, or were, of various elongated shapes, mostly with some kind of plug, which, driven into the lead by the force of the explosion, causes it to fill up the grooves in the rifling of the barrel. This expanding or dilating action has been claimed by many inventors; but the English government, in 1857, awarded Mr. Greener £1000 as being the person who had practically solved the difficulty as far back as 1836. Bullets for rifles are now made with extraordinary speed, by machinery of beautiful construction. The machine draws in a coil of leaden rod, unwinds it, cuts it to the required length, stamps out the bullets with steel dies, drops them into boxes, and conveys them away. Each machine, with its four dies, makes 7000 bullets per hour; and four such machines, in an easy day's work, turn out 300,000 bullets. So nearly are the machines automatic, that one man can attend them all. Other machines, attended by children, produce an equal number of little boxwood plugs for filling the cavity at the hinder end of the bullet. The differences between various bullets of modern invention are further noticed under **CARTRIDGE-BREECH-LOADING ARMS**.

BULLET-TREE, or **BULLY-TREE**, a tree found in Guiana, and valued for its wood, which is solid, heavy, close-grained, and durable, and also for its fruit, which is a drupe about the size of a cherry, and very delicious. It is supposed to belong to the genus *mimusops* (natural order *sapotaceæ*, q.v.).

BULLETIN. See **BULL**.

BULL-FIGHT. Combats of men with bulls, for the entertainment of the public, were common in Greece, particularly in Thessaly, and in Rome under the emperors, though in later times they were forbidden both by emperors and popes. They are still a favorite pastime in Spain and Mexico. In Spain, they were abolished by Charles IV.; but Joseph, Napoleon's brother, re-established them, out of policy, the mass of the Spanish population being passionately fond of the sport. The most magnificent bull-fights were at one time instituted by the monarchs themselves; at present, both in the capital and in the larger towns of Spain, they are held either as private speculations, or for the benefit of public institutions. In Madrid, the bull-fighting season commences in April, and lasts until November. During that time, there is at least one afternoon in every week devoted to the sport. The proceeds go to the funds of the

general hospital. The fights take place in a kind of circus, called the *Plaza de Toros*, round which the seats rise one above another, like the steps of a stair, with a tier of boxes over them. The *Plaza* is capable of containing from 10,000 to 12,000 people, who pay a high price of admission, considering the rate of wages in Spain; and all go attired in their best to the spectacle. The best Andalusian bulls are bred at Utrera, the best Castilian ones on the Jarama, near Aranjuez. The latter are the breed usually chosen for fight in Madrid. They are fiercer and more active, but inferior in strength to British animals. The horses engaged in the conflicts are worthless brutes, fit only for the knacker. The men employed in the fight are generally those who have been bred to it as a profession, but occasionally amateurs may take part in it. The bull-fight has been described as a tragedy in three acts. The principal performers in the first are the *picadores*; in the second, the *chulos* are the only actors; the third and last act devolves solely on the *matador*. The *picadores* are all mounted, dressed like Spanish knights of the olden time, and armed with a lance; they take up their position in the middle of the circus, opposite the bull-stalls. The *chulos*, who are on foot, are gay with ribbons, and wear very bright-colored cloaks; they distribute themselves in the space between the barriers. The *matador*, or chief combatant, is also on foot. He is handsomely dressed, and holds in the right hand a naked sword, in the left the *muleta*, a small stick, with a piece of scarlet-colored silk attached. On a sign given by the chief magistrate, a bull is let out from the stalls; the *picadores* stand ready in the arena waiting his charge. With a brave bull, they find all their skill requisite in acting on the defensive; with a cowardly one, they act on the offensive; and should their stabs be ineffectual in rousing the animal to the requisite fury, the poor beast is hooted by the crowd, and ultimately stabbed ingloriously in the spine. Whenever a horse is wounded, the rider betakes himself to flight; and when either the above casualty happens, or a *picador* is thrown, the *chulos* rush in, and attract the bull by their cloaks, saving themselves, if need be, by leaping over the palisade which incloses the circus. At the same time, another *picador* calls off the bull's attention to himself by shouting. When the bull begins to flag, the *picadores* are succeeded by the *chulos*, who bring with them the *banderillas*—i.e., barbed darts about two feet long, ornamented with colored paper flags, which they stick into the neck of the animal. Sometimes these darts have crackers attached to them, the explosion of which makes the bull furious. The *matador* now enters alone to complete the tragic business. As soon as the bull's eye catches the *muleta*, he generally rushes blindly at it; and then the *matador*, if he is well skilled, dexterously plunges the sword "between the left shoulder and the blade," and the animal drops dead at his feet. The victorious *matador* is greeted with acclamations, and not less so the bull, should he wound or even kill the *matador*, in which case, another *matador* steps forth into the arena; but human life is rarely sacrificed. Eight or ten bulls are often dispatched in a single day; twenty minutes being about the time usually taken to slay one.

In Madrid, in June, 1833, 99 bulls were killed in the course of a single week. During the exposition in Paris in 1889, a series of bullfights was given there, but after the first exhibition, the authorities forbade the actual killing or wounding of the bull; nevertheless a number of the *matadores* were seriously injured. See illus., SPAIN, vol. XIII.

BULL-FINCH, *Pyrrhula vulgaris*, a bird of the great family of *fringillidæ* (q.v.), a little larger than the common linnet, and of a genus closely allied to the crossbills and crossbills. The genus is particularly characterized by the short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper mandible overhangs that of the lower one. The bull-finch is a bird of very soft and dense plumage, of a delicate bluish-gray color above, the under parts of a bright tile-red, the crown of the head and the beak jet black, which color also appears in the greater wing and tail coverts, in the quills, and in the tail-feathers; the wings are crossed by a conspicuous white bar. The colors of the female are less bright than those of the male. The tail of the bull-finch is almost even. This bird is not unfrequent in England, Ireland, and the s. of Scotland; and is found in most parts of Europe, from the s. of Norway to the Mediterranean, extending eastward throughout Asia, even to Japan. It frequents woods and gardens, builds its nest in trees or bushes a few feet from the ground, feeds chiefly on seeds and berries in winter, and in spring is excessively destructive to the buds of fruit-trees in those localities in which it is abundant, selecting the flower-buds.

The song of this bird, in a wild state, is very simple, and has no particular quality to recommend it; but it is remarkably susceptible of improvement by education; and trained bull-finches of superior acquirements are sold at a very considerable price. Some of these birds learn to whistle an air very accurately, and with a power and variety of intonation far exceeding their natural song. The ability to whistle several airs well, is rare. The training of these birds is a work both of time and trouble: it is chiefly carried on in Germany. Not less than nine months of training are requisite: it begins when the bird is a mere nestling, and must be carefully continued till after the first moulting; for it is a curious circumstance, that all which has been previously acquired is very apt to be lost at that time, or is afterwards so imperfectly remembered that the bird is of little value. The bull-finch is capable of very strong attachment to those who feed and caress it, and often becomes so thoroughly domesticated as to exhibit no desire for

liberty.—Curious variations of plumage are sometimes observed in it.—Other species of the genus *pyrrhula* are known, natives of different parts of the world; and in this genus some ornithologists include *corythus* of Cuvier, of which one species, the pine-finch (q.v.), or pine grosbeak, is a native of Britain. See illus., BIRDS, vol. II.

BULL-FROG, *Rana pipiens*, a species of frog (q.v.) found in most parts of the United States and Canada, but chiefly abundant in the southern states. It is of a large size, 8 to 12 in. long, of an olive-green color, clouded with black. It receives its name from the remarkable loudness of its voice, which has been compared to the bellowing of a distant bull, and comes in as a hollow bass in the frog concerts which take place in the evening and all night long in marshy places in America. Its voice can be distinctly heard at a distance of 40 or 50 yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insect and molluscous food, like smaller frogs, but is said to be partial to young ducks, and to swallow them entire. Audubon says "its flesh is tender, white, and affords excellent eating," the hind legs, however, being the only part used for food. He adds that these parts make excellent bait for the larger cat-fish.

BULL, GOLDEN, applied to the decree of Charles IV. of Germany, published in 1356, to fix the laws for the election of emperors and regulate the number of electors. A similar edict by Andrew II. of Hungary (1222), for similar purposes bears the name.

BULLHEAD, RIVER BULLHEAD, or MILLER'S THUMB, *Cottus gobio*, a small fish, abundant in clear rivers and streams, in some parts of the British islands, throughout the greater part of Europe, and in the n. of Asia. It seldom exceeds 4 or 5 in. in length; is of a dark brown color on the upper parts, and white beneath; has rather large fins, with rays slightly produced into spines and prettily spotted; and in general appearance is not unlike the gurnards (q.v.). It is, however, generally regarded as a disagreeable object to the sight, on account of the great size and depressed form of its head, from which it derives its English names; the name, miller's thumb, alluding to the broad rounded form which the last joint of the thumb of a miller used to acquire in times when machinery was ruder than now, by its continual employment in testing the quality of the flour produced, and in turning it over on the fingers for inspection, that it might be known if the mill was doing its work well. The appearance of the B. is rendered still more unattractive by the entire absence of scales, a characteristic of the genus to which it belongs, the whole body and head being covered with a soft skin. Yet it is said to be of a very delicate flavor, and in some countries is much sought after as an article of food. Its flesh, when boiled, is reddish, like that of the salmon. Izaak Walton speaks of angling for the B., and in his pleasant quaint style describes the habits of the fish: "He does usually dwell and hide himself in holes, or amongst stones in clear water, and in very hot days will lie a long time very still, and sun himself, and will be easy to be seen upon any flat stone, or any gravel, at which time he will suffer an angler to put a hook baited with a small worm very near into his mouth, and he never refuses to bite, nor indeed to be caught, with the worst of anglers."—The other British species of the genus *cottus* (q.v.) are marine. The name B. is not usually given to any of them. A sea-fish of a nearly allied genus (*aspidophorus*) is sometimes called the ARMED BULLHEAD; it is also known as the Pogge (q.v.).—The river B. differs from the marine species of the same genus, in having only one short spine on each side of the head, on the *preoperculum*.

Bullhead is, again, a popular name applied to several species of fresh and salt water fish found in the eastern parts of America, and belonging to the genera *cottus* and *acanthocottus*. The common B., often called the "sculpin," is well known to anglers for its scarecrow form and colors. They are voracious, devouring small fish, crabs, decayed flesh, etc., and frightening away such fish as they cannot eat. They vary greatly in size, but are usually small, and seldom used for food.

BULLINGER, HENRY, the friend of Zwingli, and one of the chief reformers in Switzerland, was born at Bremgarten, in the canton of Aargau, July 18, 1504. He studied at Cologne, where he became acquainted with the writings of Luther; and during the year 1527, he attended the theological expositions of Zwingli, and went along with the latter to the religious conference held at Bern in 1528, the result of which was the reformation of the canton. In 1529, he married Anna Adlischwyler, formerly a nun, who bore him eleven children. By a powerful sermon which he preached at Bremgarten, on Whitsunday, 1529, B. induced his whole congregation to make a profession of Protestantism. In 1531, he was compelled by the Catholic party to flee from the canton, and went to Zurich, where, in the following year, he was appointed pastor of the principal church. In the controversy on the eucharist and the affairs of the Anabaptists, B. distinguished himself by his integrity and moderation; and in his house at Zurich several German theologians, compelled to leave their country, were hospitably sheltered. He took part in drawing up the first Helvetic confession at Basel, in 1536, and in establishing a close relation between the Swiss and Anglican churches. He died Sept. 17, 1575. His writings are numerous. The most important is a *History of the*

Reformation, which was first published at Zurich, 1838. His sermons have been translated into English. See the Lives of B. by Hess (1828) and Christoffel (1875).

BULLION usually means uncoined gold and silver, in bars or other masses; but in discussions on the currency, the term is frequently employed to signify the precious metals coined and uncoined. The origin of the word B. in its present sense, as well as that of the French *billon* (q. v.), and the corresponding Spanish *vellon*, seems to be as follows: B. originally meant the mint, where the alloy for the coinage was prepared, and the coin stamped (either from the Lat. *bullā*, a round boss or stud, or stamp; or from the verb *bullare*, to boil or bubble); and hence it came in England to signify the standard metal of which the coins are made. In France, where the kings debased the currency much more than ever took place in England, *billon*, the mint, came to signify the base mixture issued therefrom.

It is a question not yet satisfactorily settled, how far any great increase in the supply of B. has that effect in lessening the value of money, and consequently raising prices, which has always been very naturally attributed to it. It may indeed be maintained with some plausibility, that if B. were capable of being produced to such an extent beyond the actual demand for it as to glut the market, it would cease to be that general standard of money value which it has become, just because it is of all others the article which is steadiest in requiring a certain outlay of labor to produce it. Rises in prices have accompanied large supplies of gold, but they have also accompanied large supplies of other commodities indicative of a great increase in riches. It is certain that great increases in the supply of B. do not, as in the case of other goods, glut the market. Several years ago, the supply of gold, owing to the new fields opened in America and Australia, was about quadrupled, with certainly no more influence on prices than what a general increase in prosperity might cause. There is, it will be observed, this great difference between gold and other commodities, that besides what may be within the crust of the earth, there is a great mass which has been accumulating for thousands of years in the possession of mankind, which comes forth as it is wanted. A few millions of tons of iron, or bales of cotton, beyond the usual annual average, would perhaps add a hundred per cent to the available quantity for consumption; but a few millions of pounds' worth of gold, having to be counted with all the gold in existence in the world, makes a scarcely perceptible addition to the stock. Of late years the production of gold has been steadily declining, while that of silver has been increasing, a fact due to the opening of the great silver mines in our western states. The natural result of this has been the appreciation of gold in value as compared with silver, an appreciation which would have been greater had not the demand for silver received a steady impetus by the increased use of it in the arts. The value of the gold production of the world in 1895 was estimated by the director of the United States Mint as \$203,000,000. Of this the United States produced \$46,610,000, or 2,254,760 ounces. The total amount of gold deposited at the U. S. mints from 1793 to 1895 was \$1,587,410,923. Regarding silver, the United States produced in 1895 silver bullion to the amount of \$72,051,000. Since 1793 the total value of the silver coined here is \$687,607,628. Canada now produces annually about \$1,000,000 worth of gold and \$400,000 worth of silver. See BIMETALLISM; MINING; GOLD; SILVER.

BULLITT, a co. in central Kentucky, on Salt river and Rolling fork, intersected by the Louisville and Nashville railroad, 272 sq. m.; pop. '90, 8291, includ. colored. Productions, chiefly agricultural, timber, corn, and fruit. Co. seat, Shepherdsville.

BULLOCH, a co. in s.e. Georgia, between the Ogeechee and Cannochee rivers; 903 sq. m.; pop. '90, 13,712, includ. colored. It is level, with poor soil, in large part covered with pine forests, and abounding in game. Corn, cotton, and sweet potatoes are raised. Co. seat, Statesboro.

BULLOCK, a co. in s.e. Alabama, on the Conecuh river, and the Central Georgia railroad; 649 sq. m.; pop. '90, 27,063, includ. colored. Productions, corn, cotton, etc. Co. seat, Union Springs.

BULLOCK, ALEXANDER HAMILTON, LL.D., 1816-82; b. Royalston, Mass.; fitted for college at Leicester acad.; graduated at Amherst college, 1836; teacher at Princeton, N. J., 1836-39; studied law with Emory Washburn and at Harvard Law School, 1839-41; was admitted to the bar, 1841; practiced in Worcester, 1842-82. He was a member of the Mass. house of representatives, 1845-47 and 1861-65; speaker, 1862-66; member of Mass. senate, 1849; commissioner of insolvency, 1852-56; judge of court of insolv., 1856-58; mayor of Worcester, 1859; gov. of Mass. 1866-68; trustee of Amherst coll., 1852-82. He published a number of addresses political and literary. He received from Amherst, 1865, and from Harvard, 1866, the degree of LL.D.

BULL RUN, a small stream in n.e. Virginia, falling into the Occoquan about 25 m. s.w. of Washington, the site of two important battles early in the late civil war. The first battle took place July 21, 1861, the national forces commanded by Gen. McDowell and the confederates by Gens. Johnson and Beauregard. The forces were about 28,000 for McDowell and very nearly the same number on the other side, though not more than

18,000 unionists were actually in the conflict. Until about 4 P.M. the advantage was evidently with the union side; but at that time an impetuous charge from Beauregard's whole line turned the tide, and the union army was completely routed and fled as best they could across the stream to Centerville, where a council of war was held and a retreat to Washington determined upon. The union loss was: killed, 481; wounded, 1011; missing, 1460. The confederate loss was: killed, 378; wounded, 1489; missing, 30.

On the 29th and 30th of Aug., 1862, the second battle was fought, Gens. McDowell and Pope commanding the union forces, with Gens. Lee, Jackson, and Longstreet on the other side. On the last day the unionists were defeated and fell back to Centerville, where they suffered another repulse, and then retired to Washington. The forces engaged were about 35,000 union, and 46,000 confederate. No complete report of the union losses was given, but the figures for killed, wounded, captured, and missing are put at 11,000; Lee reported the confederate loss to be 1090 killed, and 6514 wounded, but the report was incomplete, others making the total loss 8400. The confederates call these engagements the "first and second battles of Manassas."

BULLS AND BEARS, a common designation in the stock market for two classes of operators; the "bulls" being those who seek to advance prices, and the "bears" those who endeavor to bring them down. A fanciful derivation of the term is that a bull tosses up with his horns, while a bear tears down with his claws.

BULL'S EYE, an oval wooden block without a sheave, but with a groove around it for the band and a hole in the centre, through which a small stay or rope may be rove. A perforated ball on the jaw-rope of a gaff. A round piece of thick glass, convex on one side, inserted in a deck, port, scuttle hatch, or skylight cover of a vessel to admit light. Also the central or innermost division of a target, usually round and of a different color from the rest.

BULL-TERRIER, a cross-breed of the regular bull-dog and various kinds of terriers, having more docility than the bull-dog and all the sagacity of the terrier. The bull-terrier is a favorite house-dog, noted for watchfulness and its intense enmity to rats.

BULL TROUT, *Salmo eriox* or *S. griseus*, a fish nearly allied to the salmon, and like it, migratory in its habits, ascending rivers, in which it deposits its spawn, but living chiefly in the sea. It occurs in many of the rivers of Britain, and is not unfrequently taken in the Tweed and its tributaries. It is frequently called the GRAY TROUT, sometimes simply the GRAY, and is the SEWEN of the Welsh rivers. It sometimes attains the weight of 20 lbs., although it is more commonly under 15 lbs. weight. It is less elegant in form than the salmon; the head and nape of the neck are thicker in proportion; and the tail, beyond the adipose fin, is more bulky and muscular; the tail fin is square at the end in young fish (in some places called *whitlings*), and in older ones, becomes convex by the elongation of the central rays, whence the name *roundtail* sometimes given this species. The scales are rather smaller than those of a salmon of equal size, and the color is less bright; the males in the spawning season being reddish brown, the females blackish gray; at other times the general color is like that of the salmon trout. The B. T. agrees with the salmon in having only a few teeth on the most anterior part of the *vomer* (the bone which runs down the center of the palate); while the salmon trout, the common trout, and the great lake-trout, have a long line of teeth there: the teeth are larger and stronger than those of the salmon; there are differences also in the form of the gill-covers. To anglers the B. T. is next to the salmon as a prize, and by many is mistaken for it. The flesh is paler in color, coarser, with much less flavor, and is much less esteemed.—The name B. T. has been also given to the HUCHO (*salmo hucho*).

BÜLOW, FRIED. WILH. VON, a famous Prussian gen. in the war of liberation, was b. in 1755, entered the army young, and soon distinguished himself. When Prussia declared war with France in 1813, it was B. that commanded in the first successful encounter with the French at Möckern, April 5, and revived the self-confidence of the army after the adverse battle of Lützen. His victories over Oudinot and Ney at Grossbeeren and Dennewitz, saved Berlin, and inflicted severe loss on the enemy. He acted a conspicuous part in the battle of Leipsic, and by taking possession of Montmartre, finished the campaign of 1814. The king acknowledged his services by an estate worth \$150,000, and the title of count Dennewitz. In the campaign of 1815, he joined Blücher by forced marches, and headed the column that first came to the aid of Wellington at Waterloo. He died at Königsberg, Feb. 25, 1816.

BÜLOW, HANS GUIDO VON, pianist and composer, b. in Dresden, Jan. 8, 1830. He studied the pianoforte under Friedrich Wieck, and harmony and counterpoint under Eberwein and Hauptman, and entered the University of Leipsic in 1848, and that of Berlin in 1849 to study law. After hearing a performance of *Lohengrin* conducted by Liszt in Weimar in 1850, he resolved to make music his profession, much to the disappointment of his father, Edouard von Bülow, a littérateur of reputation, and placed himself under Wagner in Zurich, but subsequently went to Weimar to study the pianoforte with Liszt. In 1853 he made his first concert tour in Germany, with great success. In 1855-64 he was principal instructor of the pianoforte in the Conservatory of Berlin, where he organized symphony and chamber concerts, and contributed musical articles to the press to advance the theories of Liszt and Wagner, and also edited the

Neue Zeitschrift für Musik. In 1864 he became director of the conservatory and conductor of the Royal Opera in Munich, where he conducted the first performance of Wagner's (q. v.) *Tristan und Isolde* and *Die Meistersinger*. He lived several years in Florence, went to London, and in 1875-76 visited the United States. Afterwards he was conductor of various orchestras in Germany, and again visited America in 1889 and 1890. In 1857 he married Liszt's daughter, Cosima, who was divorced from him in 1869 to marry Wagner. Bülow ranks with Liszt, Rubinstein, and D'Albert as one of the greatest pianists of his century; and his fame as a conductor is equally great. His memory was extraordinary, as he played and conducted everything without notes, and his repertory included all the important literature for the pianoforte and orchestra. He was probably the most erudite musician in the history of his art, and his scholarly attainments extended beyond his profession. Von Bülow was the greatest authority on Beethoven, and published a valuable edition of his pianoforte works. He also made pianoforte transcriptions from Wagner, Liszt, and Berlioz. His original compositions include: Music to Shakespeare's *Julius Cæsar*, op. 10; *Des Sängers Fluch*, ballade for orchestra on Uhland's poem, op. 16; and *Nirvana*, a symphonisches Stimmungsbild, for orchestra, op. 20. He d. in 1894.

BULOZ, FRANÇOIS, 1803-77; b. Vublens, near Geneva, Switz.; settled in Paris and became first a proof-reader and then a translator. In 1831 he founded the *Revue des Deux Mondes*, a bi-monthly, which he edited with such conspicuous ability as to make it the representative literary journal of France. The *Revue* was afterward edited by his son Charles.

BULRUSH, an English popular name for large rush-like or reed-like plants growing in marshes, not very strictly limited to any particular kind. Some authors employ it in a restricted sense as the designation of plants of the genus *typha*, also known as cat's-tail or reed-mace. See **TYPHA**. It is perhaps more commonly restricted to large species of the genus *scirpus* (q. v.), also called club-rush, and particularly to *S. lacustris*, a common British plant, found also in all the northern parts of the world, growing about the muddy margins of lakes and ponds, with a creeping root and round stems varying from 2 to 8 ft. in height, which are almost leafless, and bear their flowers in compound umbels of small brown spikelets on their side. The root is astringent and diuretic, and was formerly employed in medicine; but the stems are the most useful part of the plant, being much employed for making chair-bottoms, mats, etc.; also by coopers for filling up spaces between the seams of casks, to which purpose their spongy nature particularly adapts them, and not unfrequently for thatching cottages.

BUL'SAR, a seaport of India, in the British district of Surat, presidency of Bombay, on the estuary of a small river of the same name, which falls into the gulf of Cambay. It is 44 m. s. of Surat. It is a thriving place, with manufactures of gingham, and a considerable trade in grain, salt, and sugar. Pop. about 13,200.

BULTI, or **LITTLE THIBET**, a territory lying on the upper Indus beyond the Himalaya, and forming a sort of debatable land between India and Tartary. It is immediately to the n. of the valley of Cashmere, with which it is politically connected by conquest. It occupies about 12,000 sq. m., extending in n. lat. between 35° and 35° 30', and in e. long. between 75° and 76°. With an average elevation of about 7000 ft. above the sea, B. is surrounded by mountains of nearly the same height above its own level. Hence the temperature is such that only snow falls in what ought to be the rainy season, though in summer the thermometer ranges at noon from 70° to 90° F. European fruits are said to be plentiful. The inhabitants are of the Mongolian race, and chiefly Mohammedans. Among the animals are the sha, the large-horned goat, the sheep, the musk-deer, and the ibis. The only town of consequence is the capital, Iskardoh, which, in fact, sometimes gives its name to the whole province.

BULUBGURH, or **BALLAMGARH**, a t. of India, the principal place of a jaghire of the same name, called also Furreedabad. The town is situated on the route from Delhi to Muttra, 29 m. s. of Delhi, in a pleasant well-cultivated country. The town is not large, and is very crowded, surrounded by a high brick wall, with mud bastions and a deep ditch.

BULWARK, in military matters, was the old name for a rampart or bastion. In a ship, the bulwarks are the boarding above the level of the upper deck, nailed to the outside of the timber-heads and stanchions. In ordinary vessels they form a parapet, protecting the seamen from the waves, and prevent loose articles from being swept off the deck; in men-of-war they, in addition, serve to protect the men from an enemy's shot.

BULWER, Sir HENRY LYTTON, G.C.B., the right hon., diplomatist and author, an elder brother of the late lord Lytton, was b. Feb. 13, 1801, entered the diplomatic service in 1827, and was attached successively to the British embassy at Berlin, Brussels, and the Hague. In 1830, he entered parliament, and during the following seven years he represented, in order, the constituencies of Wilton, Coventry, and Marylebone. In 1837, he became secretary of embassy at Constantinople, where he negotiated and concluded a treaty which is the foundation of our present commercial system in the east. In 1843, he was made minister plenipotentiary to the court of Madrid, and concluded the peace between Spain and Morocco in the following year. Whilst in Spain, his firmness and candor proved a source of great inconvenience to Narvaez, the Spanish soldier-diplo-

matist of that day, and who, pretending to have discovered the complicity of the British plenipotentiary in certain plots against the Spanish government, ordered him to leave Madrid. Both parties in the house of commons approved of the whole course of B.'s conduct while at the court of Madrid, and her majesty awarded to him the highest decorations of the order of the Bath. In 1849-52 he was minister at Washington, where he negotiated the Bulwer-Clayton treaty in 1850 (see CLAYTON, JOHN MIDDLETON), and maintained the interests of his own country. In 1852, he was sent to Tuscany as envoy extraordinary; and in 1856 was nominated by lord Palmerston commissioner at Bucharest for investigating the state of the Danubian principalities. As British commissioner, he called forth from every minister and from every government concerned the warmest expressions of approval, and all concurred in recommending him for the post of ambassador to the Ottoman porte, on the return of lord Stratford de Redcliffe, in the spring of 1858. Sir Henry Lytton became a peer in 1871, with the title of lord Dalling and Bulwer. He died in 1872. His works include a *Life of Palmerston*; *Historical Characters*; *An Autumn in Greece*; *France, Social, Literary, and Political*; and a *Life of Byron*.

BULWER-LYTTON, EDWARD ROBERT, Earl, only son of the English novelist, b. 1831; educated at Harrow and Bonn; went into diplomatic service, 1849, under his uncle, sir Henry, who was then British envoy to the United States; afterwards served diplomatically at Florence, Paris, the Hague, Vienna, Copenhagen, Athens, Lisbon, Madrid, and again at Vienna and Paris. He succeeded to his title on the death of his father in 1873. In 1874 he was sent again to Lisbon as ambassador, and 1876-80 was viceroy of India, where, Jan. 1, 1877, he presided at the ceremonial proclamation of Victoria as empress of India. In literature he was widely known as "Owen Meredith," and as the author of many poems, the chief of which is *Lucile*. Other works are *Tannhäuser*, or *the Battle of the Bards*; *Neville Temple*; *Julian Fane*; songs of Servia; *The Ring of Amasis*; *Chronicles and Characters*; *Orval*, or *the Fool of Time*; imitations in verse from various languages; *Fables in Song*; a biography of his father, 1884; and *King Poppy* (posthumous, 1892). From 1887 till his death in 1891, he was British ambassador at Paris.

BULWER-LYTTON, Sir EDWARD. See **LYTTON**.

BUM BAILIFF. See **BOUND BAILIFF**.

BUMBOAT, a boat employed to carry provisions and other articles from harbors and ports to vessels lying at some distance from the shore. Boats of this kind belong to a class of petty traders, who in England are, for the most part, women. The provisions commonly offered for sale are soft bread, butter, fruit, vegetables, fish, and fresh meat—the fish fried, and the meat roasted, if wanted. Among the other articles are included shirts, drawers, stockings, gloves, pipes, needles, thread, and a variety of odds and ends. The less respectable of the B. traders try to smuggle spirits on board; but if this is discovered, it leads to instant punishment. In fitting out and also in paying off ships in the navy, the B. people are allowed on board for a certain length of time daily; but when a ship is in active commission, they come alongside only at meal-hours. Among the class of B. people generally, there is no little acuteness and enterprise.

BUMKIN, or **BOOMKIN** (diminutive of *boom*), on shipboard, is a short boom which projects over each bow of the ship, to aid in extending the lower edge or clue of the fore-sail to windward—in nautical phrase, "to board the fore tack to." In a boat, the B. is a small outrigger over the stern, used for extending the mizzen.

BUMMALOTI, *Saurus ophiodon*, a fish of the family *scopelidae* or *sauridae*, often regarded as a subdivision of the great family *salmonide*. It is a marine fish, a native of the coasts of India, particularly of the Bombay and Malabar coasts, from which it is exported in large quantities, salted and dried, to other parts of India, being highly esteemed for its rich flavor, and often used as a relish. In commerce, it is known not only by the name B., but by the singular appellation of *Bombay duck*. It is a fish of elongated form, with large fins and a very large mouth, the gape of which extends far behind the eyes, and which is furnished with a great number of long, slender teeth, barbed at the points. It is extremely voracious.

BUNCE, FRANCIS MARION, naval officer; b. in Hartford, Conn., Dec. 25, 1836; became a midshipman in the U. S. navy 1852, commander 1871, captain 1883, and commodore 1895; was appointed commander of the North Atlantic squadron with the rank of rear-admiral in 1895; and had charge of the naval demonstration at the dedication of Gen. Grant's tomb, April 27, 1897.

BUNCO. A term borrowed from the *argot* of the police, to describe a method of swindling much practiced in large cities. The sharper learns the name and residence of a wealthy stranger, accosts him in the street, pretends to be a relative of some prominent citizen of the stranger's town, and after securing his confidence, manages to rob him in any one of several customary ways, either by inducing him to cash a check, to bet, to loan money, or, rarely, by actual violence.

BUNCOMBE, a co. in s.w. North Carolina, n.e. of the Blue Ridge, on French Broad river and the Southern railroad; 628 sq. m.; pop. '70, 15,412—2303 colored; in '90, 35,266. The surface is rough, but the soil is fertile and good for cattle-raising. There are warm springs in the n.w. part. Corn, wool, and tobacco are the chief productions. Co. seat, Asheville.

BUNDELCUND', a territory of Hindustan, between Gwalior on the w. and the Jumna, which separates it from the Doab, on the n.e. The area formerly known as B. included four districts belonging to the British north-western provinces (Banda, Jalun, Jhansi, and Hamirpur). Now B. is officially used only for the "Bandalkhand agency," a subdivision of the Central India agency, and in this sense is applied to a group of nine native states, and twenty-five petty jaghires under native princes. The area of the agency is 10,214 square miles. Studded, as B. is, with isolated rocks, rising precipitously from its surface—each of them a nucleus, as it were, of independence—it has generally been very much subdivided. Notwithstanding that it is well watered, the climate renders irrigation indispensable; and it is accordingly interspersed, at the cost of great labor and ingenuity, with artificial dams. B., though not destitute of woodlands, presents rather jungle and cope than heavy timber. It is said to possess inexhaustible deposits of iron-ore and some coal. The principal towns of B. are Calpee, Jhansi, Callinger, Banda, Jalun, and Chaturpur. The first three are noticed in their places, Callinger being famous for its cave-temples, and Jhansi and Calpee having acquired celebrity in the mutiny of 1857-58.

BUNDI, or **BOONDEE**, a t. of India, in n. lat. 25° 26', e. long. 75° 43', 190 m. s.w. from Agra, the capital of a small state of the same name. It is situated in a valley nearly surrounded by rocky hills.—The raj or state of Bundi has an area of 2225 sq. miles. A range of mountains running n.e. and s.w., divides two nearly equal level tracts—that on the s.e. extending to the river Chumbul, and that on the n.w. to the base of the mountains towards Ajmere. The climate is said to be unhealthy. Although the rajah and dominant portion of the inhabitants are Rajpoots, the greater part of the population, particularly in the mountains, are Meenas, supposed to be an aboriginal race, who are indefatigable freebooters. Pop. of B. in 1891, 296,000.

BUNGALOW, a species of rural villa or house, so called in India. Bungalows which form the residence of Europeans are of all sizes and styles, according to the taste and wealth of the owner. Some are of two stories, but more usually they consist of only a ground floor, and are invariably surrounded with a veranda, the roof of which affords a shelter from the sun. In the chief cities of Calcutta, Madras, and Bombay some of the bungalows are really palatial residences, while in the mofussil they are of more moderate pretensions. In general, they are provided with exterior offices, to accommodate the large retinue of domestics common in Indian life. Besides these private bungalows, there are military bungalows on a large scale for accommodating soldiers in cantonments; likewise public bungalows, maintained by government for the accommodation of travelers, and in which seem to be blended the characters of an English road-side inn and an eastern caravanserai. These bungalows, though they vary greatly in actual comfort, are all on the same plan. They are quadrangular in shape, one story high, with high-peaked roofs, thatched or tiled, projecting so as to form porticoes and verandas. The B. is divided into "suits" of two, three, or four rooms, provided with beds, tables, and chairs; windows of glass, and framed glass doors. Off each room is a bath-room, and earthen jars of cool water. Travelers are expected to carry their servants, cooking-apparatus, wine, beer, bedding, etc., with them; but the *khitmutgar* of the better class of bungalows supplies table-ware, condiments, and even sometimes food and liquors, and he is usually skilled in cooking. Government charges one rupee, or two shillings a day, to each traveler for the use of the bungalow. A book is kept, in which travelers enter their names, the time of their arrival and departure, with the amount paid, and any remarks regarding the state of the B. and its attendance he may think proper. Natives seldom stop in these public bungalows, for though legally open to all, they are almost exclusively resorted to by Europeans; and natives even of good condition are fain to seek "the squalid desolation of a tottering caravanserai," or village "dhurrumsala." At every travelers' B. is stationed a government peon, who acts as watchman, and is bound to assist travelers' servants in procuring supplies of fuel and food in the nearest village. The distance between each B. on a trunk-road is generally about 12 or 15 m.—an Indian day's journey. The introduction of railways will very soon put an end to the present system of traveling in India—a fact greatly to be desired, as the annoyance experienced moving slowly on with baggage and servants at the rate of a stage a day is almost inconceivable.

BUNGAY, a market-t. of the co. of Suffolk, England, 30 m. n.n.e. from Ipswich. It occupies the sides and summit of a gently rising hill, on the right bank of the Waveney, and is a well-built town, with wide streets, the principal ones diverging from the market-place. The town grew around Bungay castle, which is supposed to have been erected by the Bigods, earls of Norfolk, and of the walls of which some ruins still remain. The ruins of a Benedictine nunnery are also to be seen in the town. The church of the Holy Trinity is an edifice, with a round tower, supposed to be of the time of Edward the confessor. There are numerous places of worship, belonging to different denominations, and schools, charitable institutions, assembly-rooms, etc. What was formerly the theater is now used as a corn-hall. B. carries on a considerable trade by the river Waveney in corn, malt, flour, coals, and lime. Pop. '61, 3805; '91, about 4000.

BUNIAS, a genus of plants of the natural order *cruciferae*, distinguished by *incumbent* linear spirally twisted cotyledons (q.v.), and a nut-like silicle (or round pod) with 2 to 4 cells. Only a few species are known, natives of the Levant. One of these, *B. orientalis*, is cultivated in some countries—particularly in France—as a field-crop, for the sake of its leaves, which are used for feeding cattle. It was introduced into Britain more than 100 years since, but its cultivation has never become general, the amount of herbage which it yields being comparatively small. It is sometimes called **HILL MUSTARD**.

BUNION is a term applied in surgery to enlarged bursæ, or synovial sacs, situated in the anterior part of the foot, and especially over the metatarsal joint of the first or the fifth toe (see **FOOT**), and accompanied by more or less distortion of the joint. In the great majority of cases, bunions are directly produced by the pressure of badly-fitting boots; and if the boots are constructed of patent leather, or any material which stops the excreting action of the skin, this, too, may be regarded as an indirect cause of their formation. A bunion begins as a painful and tender spot over one of the metatarsophalangeal joints; the part gradually enlarges, and there are indications of an effusion into a natural bursa or a newly-formed sac. The progress of the affection may stop here, the bursa remaining, and serving to protect the subjacent parts from pressure; but far more frequently it undergoes repeated attacks of inflammation, causing its enlargement; or becomes the seat of corns; or supuration of the contents of the cyst ensues. The last accident may be followed either by obliteration of the cyst, and cure, or by a troublesome form of ulcer, especially in persons of languid circulation.

It is only in its early stage that there is any hope of removing the disease; subsequently, the treatment must be only palliative. The tender spot that precedes the enlargement should be covered by night with wet lint and oiled silk, while by day a boot or shoe exerting no pressure on the part should be worn. If the part is very tender, it may be covered during the day with soap-plaster spread on wash-leather. As soon as a cyst can be detected, the part should be occasionally treated with strong tincture of iodine, with a view of promoting absorption. The writer of the article on this subject in Holmes's *System of Surgery*, recommends an ointment of biniodide of mercury (ten grains to an ounce of lard) for the cure of bunions when uninfamed, and for such as have much fluid within them. It should not be applied so constantly as to blister the skin. When, from any cause, inflammation takes place in the sac, water-dressing, or a poultice, should be applied; and as soon as there are definite signs of supuration, a free incision should be made, which at once relieves the pain, and is often followed by a complete cure.

The ulcers resulting from the bursting of a bunion are very difficult to heal, especially in old persons whose circulation is languid. Stimulating local applications, such as ointment of resin, should be applied, while opium and stimulants should be prescribed for internal use, together with nourishing diet. Such ulcers, under the best treatment, not very unfrequently form the starting-point for senile gangrene.

BUNKER HILL. See **CHARLESTOWN**.

BUNKUM, a phrase used in the United States to signify an oratorical display in favor of a sham proposal, in order to catch popular applause. A member of the legislature, for example, desirous of standing well with his constituents, makes a flaming speech in favor of a measure in which they are interested; but with the knowledge that the measure is impracticable, and will not be carried. In fact, the speaker does not want to carry it; his sole object is to impose on his supporters, and acquire the character of a meritorious public leader. Such is speaking for bunkum. In some instances, the state legislatures enact laws brought forward on these dishonest grounds—the whole members, or at least a large majority of them, having no other object than bunkum. The consequence is, that many laws, agitated for by popular factions, remain a dead-letter, unless they happen to be enforced by clubs organized for the purpose. The word B. is said to be a corruption of Buncombe, the name of a county in North Carolina, the representative of which informed congress on one occasion that he was merely speaking “for Buncombe.”

BUNNER, HENRY CUYLER, 1855–96; b. Oswego, N. Y.; editor and author; editor of the humorous weekly, *Puck*, since 1877. His style was light and graceful, and he was particularly happy in the production of short stories and *vers de société*. He published *Airs from Arcady and Elsewhere*; the novels *The Woman of Honor*; *The Midge* (1886); *The Story of a New York House* (1887); *Short Sizes*, 1890; *Made in France* (1893); *More Short Sizes* (1894); and *Jersey Street and Jersey Lane and Love in Old Clothes* (1896).

BUNODES GEMMA CEA, a species of the order actinoida. See **ANEMONE**, SEA.

BUNSEN, CHRISTIAN KARL JOSIAS, Baron, one of the most distinguished statesmen and scholars of Germany, was b. 25th Aug., 1791, at Korbach, in the principality of Waldeck, and studied philology at Göttingen (1809–13) under Heyne. He taught in the Latin school there and was private tutor to W. C. Astor of New York, with whom he traveled in Germany in 1813. To continue a course of study in old and middle high German and extend his knowledge of Teutonic tongues, Bunsen now went to Holland,

and afterwards to Copenhagen, where he learned Icelandic from Finn Magnussen. The historical works of Niebuhr and his character as a politician had filled B. with enthusiasm, and he spent some months of 1815 in Berlin, in order to become personally acquainted with the historian. In 1816, he went to Paris, and studied Persian and Arabic under Sylvestre de Sacy, and in the same year to Rome, where he married. Niebuhr, then Prussian ambassador, took the greatest interest in the scientific pursuits of B., and procured (1818) his appointment as secretary to the embassy. The residence of the king of Prussia, Friedrich Wilhelm III., in Rome in 1822, had a decided influence on his subsequent career. In the course of a conversation in which B. had disagreed with the king, the latter asked his views on the Prussian ritual (*Agende*) and hymn-book question, then much agitated. Though these views were very different from what the king had been accustomed to hear, he took them in good part, and with expression of his personal regard, requested B. to continue in the state service. On Niebuhr's departure from Rome (1824), B. conducted the embassy provisionally for a time, and was then appointed resident minister (1827). Living in intimate intercourse with Niebuhr, B. had employed the time in deepening his investigation into the philosophy of language and religion; and had made, on the one hand, the philosophy of Plato and the constitutions of antiquity; on the other, biblical inquiries, church history, and liturgies—objects of special attention. Though not within the scope of the great plan of his life, he contributed largely to the *Beschreibung der Stadt Rom* (Description of Rome), 3 vols. (Stutt. 1830-43); the greater part of the topographical communications on ancient Rome, and all the investigations into the early history of Christian Rome, are by him.—The first visit of Champollion to Rome formed an epoch in B.'s antiquarian studies. He was a zealous hearer of Champollion himself, and also encouraged Lepsius (q.v.) to the study of hieroglyphics. The archaeological institute, established in 1829, found in B. its most active supporter. When he founded the Protestant hospital on the Tarpeian rock (1835), he also built, adjoining his own house, a place of meeting for the institute; and labored earnestly for the cause of Protestantism. The king of Prussia had often asked his advice in the matter of the ritual, but had not adopted it. B. then, along with the chaplain, introduced (1835) into the chapel of the embassy at Rome a liturgy modeled after his own views, and sent a report (1828) to the king of the result. The king had this liturgy printed, and wrote the preface with his own hand. This work never came into the hands of the trade; but the most part of it was embodied in the *Allgemeine evang. Gesang- und Gebetbuch*, printed (1846) without the author's name, in the Rauhe Haus, Hamburg, which may be considered as the second edition of the *Versuch eines allgemeinen evang. Gesang- und Gebetbuchs* (Attempt at a General Evangelical Hymn and Prayer Book), Hamb. 1833.

In 1841, he was sent on a special mission to London, to negotiate the erection of an Anglo-Prussian bishopric in Jerusalem, and was shortly afterwards appointed ambassador at the English court. It is understood that, on occasion of a visit to Berlin in 1844, he was asked to write down his views on the question of granting a constitution to Prussia; and that in consequence he presented a series of memorials representing the urgency for a deliberative assembly, and also made a complete plan of a constitution closely resembling the English. In the Schleswig-Holstein question, B. strongly advocated the German view, in opposition to Denmark, and protested against the London protocol of 1850. But in the midst of all his political duties, B. continued unabated his literary and philosophical pursuits, the results of which have from time to time appeared. His views regarding the part that Prussia should act in the eastern question not being, it is understood, in accordance with those of his court, he ceased, in 1854, to represent Prussia at the court of England, and retired to Heidelberg. In the estimation of Englishmen, B. must ever hold a high place. No foreigner has ever shown a deeper appreciation of their national characteristics, or a heartier love of their social and political liberty. It must also be acknowledged that he has done service to the cause of enlightened Christianity, for while in England, he was regarded by those who knew him both as the most philosophical and most reverent of lay theologians. His chief works are: *De Jure Atheniensium Hereditario* (Gött. 1813); *Die Kirche der Zukunft* (the Church of the Future—translated into English, and published by Longman), Hamb. 1845; *Ignatius von Antiochien und Seine Zeit* (Ignatius of Antioch and his Time), Hamb. 1847; *Die drei echten und die vier unechten Briefe des Ignatius von Antiochien* (The Three Genuine and the Four Spurious Epistles of Ignatius of Antioch), Hamb. 1847; *Ägyptens Stelle in der Weltgeschichte* (Egypt's Place in the World's History—translated into English by Cottrell), Hamb. 1845-57; *Die Basiliken des Christlichen Roms* (The Basilicas of Christian Rome), 1843; *Hippolytus und seine Zeit* (Hippolytus and his Time), 1851; *Christianity and Mankind*, 1854; *Gott in der Geschichte* (God in History), 1857; and the *Bibelwerk*, which B. hoped to make his chief work, of which only a part appeared before his death, which took place in 1860. See *Memoir* by his widow (1868).

BUNSEN, FRANCES, BARONESS, 1791-1876; wife of Christian Karl Josias, of whom she published a biography, London, 1868, under the title *A Memoir of Baron Bunsen, Drawn Chiefly from Family Papers by his Widow, Frances, Baroness Bunsen*. She was an Englishwoman by birth and was distinguished for her unaffected piety and kindness of heart. See *Life and Letters*, by J. A. C. Hare.

BUNSEN, ROBERT WILHELM, a distinguished German chemist, b. at Göttingen, where his father was a professor, on March 31, 1811. He entered the university of his native town in 1828, where he devoted himself to the study of the natural sciences, especially to zoology and chemistry. He afterwards prosecuted his favorite studies at Paris, Berlin, and Vienna. After having held the post of professor at Cassel, Marburg, and Breslau, successively, B. was, in 1852, appointed to the chair of chemistry at Heidelberg, where he has since remained. He has published numerous papers on physics and geology, as well as on chemistry. The burner, pump, and battery which bear his name are in extensive use. That the hydrate of oxide of iron is an antidote to arsenic, is an important fact which was made known by him, along with his friend Berthold, in 1837. B. was the first to produce magnesium in large quantities; and in 1860 he invented the magnesium light, which has proved so important to photography. But the greatest discovery with which his name is associated, is that of the spectrum analysis—made in conjunction with his friend Kirchhoff—which has been the means of working so many wonders in chemistry, and revealing so much to astronomers. Its first result was the discovery of two new metals by him, *cesium* and *rubidium*, and of *thallium* and *indium* by others. B. is not only a prolific discoverer in chemistry, but he has proved himself also one of its most successful teachers. His manner of demonstration is very happy. He published *Descriptio Hygrometrorum* (Göttingen, 1830); *Eisenoxydhydrat* (2d ed., 1837); *Gasometrische Methoden* (1857; English by Roscoe); *Flammen reaktionen* (1880); and other papers. He was made a privy-councilor of Baden in 1863.

BUNT, a disease of wheat and other grains, or the parasitic fungus which causes that disease. The name B. is supposed to be a corruption of *burnt*, or at least derived from the same root, a derivation perhaps suggested by the analogy of *brand* (q.v.). B. is also called *pepper brand*, and sometimes *smut ball*. It is one of the most common and injurious diseases of wheat, often affecting great part of a crop, although its prevalence has been greatly diminished by care on the part of farmers, and particularly by the selection of clean seed, and the dressing of the seed, before sowing, with some substance, which, without injuring its vitality, destroys that of the spores or granules of the fungus. Even washing with water has a good effect, but greater benefit is derived from dressing with salt, quicklime, chloride of lime, Glauber's salt (sulphate of soda), and quicklime, or blue vitriol (sulphate of copper). Even arsenic and corrosive sublimate are used for this purpose. B. is now believed to be propagated by any contact of sound with unsound grain; by thrashing, which causes the B. dust to fly about; or by manure, in which the straw of infected grain has been mixed. Upon this knowledge, the means now adopted for its prevention are founded. A considerable mixture of B. is not supposed to render flour absolutely unwholesome, at least when made into fermented bread, but the bread is of a peculiar flavor, and a very dark color. It is said that such flour is used to no small extent in the manufacture of gingerbread.

BUNTER SANDSTEIN, or "variegated sandstone," is the lowest member of the triassic period. As the triass is more perfectly developed in Germany than in Britain, the German beds are considered the typical group of this period. The B. S. consists of various colored sandstones, interstratified with red marls and thin beds of limestone, which occasionally, as in the Harz, are oolitic, but in other places dolomitic. They attain a maximum thickness of 1500 feet. The English representatives of the B. S. are chiefly developed in Lancashire and Cheshire, and consist of red and mottled sandstones with beds of marl, and thick rather irregular bands of partially consolidated conglomerate called "pebble beds." Thirty species of fossil plants have been found in the B. S. near Strasburg, consisting chiefly of ferns, cycads, and conifers. But the most remarkable fossils in this formation are the remains of huge batrachians. Originally, the footprints which had been left by the animals on the moist sand were alone observed. From their resemblance to the impressions made by a human hand, the animal producing them was provisionally named *cheirotherium* (q.v.). The subsequent discovery and examination of the remains of teeth and bones in the same beds, have afforded sufficient materials to enable Owen to reconstruct an animal named by him *labyrinthodon* (q.v.), which undoubtedly produced the footprints. These remains have been detected in Lancashire and Cheshire, as well as in Germany.

BUNTING, or BUNTINE, is a thin woolen material, of which the flags and signals of ships are usually made.

BUNTING, *Emberiza*, a genus of birds closely allied to finches and sparrows, and included with them by some ornithologists in the great family *fringillidæ* (q.v.), but by others made the type of a distinct family, *emberizidæ*, of which the most marked characteristics are a short, straight, conical bill, a curved form of the gape, produced by a narrowing of the sides of the upper mandible, and a corresponding enlargement of the under one, and a hard rounded knob on the palate or inner surface of the upper mandible. This knob probably aids in crushing the seeds, which are a principal part of the food of these birds. The species of the B. family are numerous, and are arranged in several genera. The true buntings (forming the restricted genus *emberiza*) have the hind claw moderately short, curved, and strong, and the palatal knob large and bony. The COMMON B. or CORN B. (*E. miliaria*)—a bird considerably larger than a house-sparrow, brown, with darker streaks on the upper parts, whitish brown, with spots and lines of

dark brown on the under parts, and with a slightly forked tail—is frequent, particularly in low cultivated grounds in Britain, and in most parts of Europe, extending also into Asia, living in pairs during spring and summer, but in flocks in winter, and often visiting barn-yards at that season, along with chaffinches and sparrows. It is the largest of the British buntings. It is supposed that the winter flocks in Britain are much increased by migration from more northerly regions. This B. often passes the night on the ground in stubble-fields, and is taken in the nets employed for catching larks, and brought with them to market. It usually builds its nest on or very near the ground. Its notes are harsh and unmusical.—The REED B., or BLACK-HEADED B. (*E. shoeniclus*), is a species common in marshy situations, both in Britain and on the continent of Europe; a very pretty little bird, with black head and throat, strikingly contrasted with the white nape and sides of the neck.—The CIRT B. (*E. cirtus*), of which the head is olive-green, with black streaks, and with patches of bright lemon-yellow on the cheeks and over the eyes, is a rare British bird, and belongs chiefly to the s. of Europe and the n. of Africa. To this genus belong also the Ortolan (q.v.) and the Yellow-hammer (q.v.).—The Snow B. (q.v.), or Snowflake (*E. nivalis* of many authors), has been placed in the new genus *plectrophanes*. The name B. has been often very vaguely used, and many species have been almost indiscriminately called buntings or finches. The palatal knob affords the best distinctive character. North America has a number of species of bunting.—The BLACK-THROATED B. (*E. Americana*) is extremely plentiful on the prairies of Texas and other south-western parts of the United States; extending, however, as far as to Ohio, and even to Massachusetts. In the middle and northern states, it occurs only as a summer bird of passage. In its habits, it closely resembles the common B. of Europe; but the palatal knob is less hard.

BUNTING, JABEZ, an eminent Wesleyan minister, was b. at Manchester in 1779. At the age of 20, he devoted himself to ministerial work, in which he was very successful. He was elected president of the annual conference in 1820, and again in 1828, 1836, 1844. In 1834, he was chosen president of the theological institution belonging to the Wesleyan Methodist body, and he acted as one of the secretaries to the missionary society in connection with his denomination, for a period of more than twenty years. He was the chief authority in all matters relating to the government and polity of Wesleyan Methodism. On his retirement from official life in 1857, his friends presented him with an annuity of £200, in consideration of the great services he had rendered to Methodism. He did not live, however, to profit by their kindness and forethought, having died in June, 1858.

BUNYAN, JOHN, one of the most popular religious writers of any age, was b. at Elstow, near Bedford, in 1628. He was brought up to his father's trade of tinker, and spent his youth in the practice of that humble craft, of which his name alone now serves to lessen somewhat the disrepute. It has generally been taken for granted that his early life was very loose and prodigate, on the sole ground of his terrible self-accusations in after-years, when, from the height of religious fervor and Puritan strictness, he looked back on dancing and bell-ringing as deadly sins. This point is satisfactorily disposed of by Macaulay (*Encycl. Britann.*, art. "Bunyan"). In his 16th or 17th year, he enlisted in the parliamentary army, and in 1645, was present at the siege of Leicester, where he escaped death by the substitution of a comrade in his place as sentry. Nothing further is known of his military career. After leaving the army, he married, and soon after began to be visited by those terrible compunctions of conscience, and fits of doubt, sometimes passing into despair, which, with some quieter intervals, made his life, for several years, a journey through that valley of humiliation of which he afterwards gave so vivid a picture. Hope and peace came at last, and in 1655, B. became a member of the Baptist congregation at Bedford. Soon after, he was chosen its pastor, and for five years ministered with extraordinary diligence and success, his preaching generally attracting great crowds. The act against conventicles, passed on the restoration, put a stop to his labors; he was convicted, and sentenced to perpetual banishment. In the mean time, he was committed to Bedford jail, where he spent the next 12 years of his life, supporting the wants of his wife and children by making tagged laces, and ministering to all posterity by writing the *Pilgrim's Progress*. His library consisted of a Bible and Fox's *Martyrs*. The kindly interposition of a high-church bishop, Dr. Barlow of Lincoln, at length released him, and he at once resumed his work as a preacher, itinerating throughout the country. After the issuing of James II.'s declaration for liberty of conscience, he again settled at Bedford, and ministered to the Baptist congregation in Mill lane till his death, at London, of fever, in 1688. B.'s whole works were published in 1736, in 2 vols. folio. The most popular of them, after the *Pilgrim's Progress*, are the *Holy War*—another allegory, much less successful—and *Grace Abounding to the Chief of Sinners*, an autobiographical narrative. It is supposed that no other book, except the Bible, has gone through so many editions, and attained to so wide a popularity, in all languages, as the *Pilgrim's Progress*. A fac-simile reprint of the original edition of the *Pilgrim's Progress* was published in 1875. A statue of B. was unveiled at Bedford in 1874. See *Life, Times and Works* by J. Brown (London, 1888).

BUNZLAU, a t. of Prussia, in the province of Silesia, is situated on the Bober, about 25 m. w.n.w. of Liegnitz. B. has manufactures of woolens, linens, hosiery, tobacco

and earthenware, and a trade in grain. An obelisk to the Russian gen., Kutusow, who died here in 1813, adorns the market-place. Pop. '90, 12,921.

BUNZLAU, JUNG or NEUE (*New Bunzlau*), a t. of Bohemia, on the left bank of the Iser, a tributary of the Elbe, 31 m. n.e. from Prague. It is well built of stone, has several churches, a Jewish synagogue, barracks, a hospital, a Piarist gymnasium, etc. It has manufactures of earthenware, glass, woollens, and hosiery. It is said to have been founded by king Boleslaf in 973, and the fort built by him still exists. Its Bohemian name is *Mlada Boleslaw*. Pop. '90, 12,921.

BUOL-SCHAUENSTEIN, KARL FERD., Count, Austrian statesman, was b. 17th May, 1797. After filling subordinate diplomatic posts, he became ambassador at Carlsruhe in 1828, afterwards at Stuttgart (1838) and at Turin (1844). Leaving Turin on the outbreak of the war in 1848, he went as ambassador to St. Petersburg, and it fell to him to uphold the interest and dignity of his country, on occasion of the aid given by Russia in the Hungarian war. A not less difficult task was assigned him when, in 1851, he was sent to represent Austria in London; his address and conciliatory bearing contributed not a little to bring about a more friendly feeling between the two governments. On Schwarzenberg's death, B. was recalled to Vienna, and became foreign minister. In this position, he carried out the new politics of Austria no less firmly and successfully, though more moderately and quietly, than his predecessor. In the negotiations during and after the termination of the Crimean war, B. showed himself a skillful and able statesman. After defending with zeal and ingenuity, in diplomatic notes and circulars, the position which Austria had taken up with reference to Sardinia, B. suddenly, on the actual commencement of the Italian campaign of 1859, resigned his place, which was immediately filled by count Rechberg. Failing health was the cause officially assigned for the step, but the general belief was, that it indicated a triumph of the war-party in the council of Francis Joseph. He died Oct. 28, 1865.

BUONAFEDE, APPIANO, 1716-93; an Italian philosopher and general of the Celestines; author of several works on philosophical themes.

BUONAROT'TI, MICHAEL ANGELO. See MICHAEL ANGELO.

BUOY, is a floating body intended as a mark for the limits of a channel, the position of shoals, rocks, wrecks, and the like. It is made either of wood or metal, and is mostly hollow to make it float the better. Buoys are generally moored by chains and heavy anchors or weights. It is the custom in northern latitudes, where more or less ice is expected in the winter season, to replace the metal buoys by wooden buoys until the ice has disappeared, as there is less danger of the wooden buoy being swept away or damaged. Buoys are of various kinds and shapes according to the purposes they are intended to serve; as can-buoys, made of sheet iron in the form of a frustum of a cone; spar-buoys, made of a spar which is anchored at one end; nun-buoys, used to mark the opposite side of the channel to the can-buoy, the name probably being derived from the similarity in shape to a nun's bonnet; bell-buoys, surmounted by a bell which is rung by the action of the waves; there is no clapper, but iron balls roll about on a plate under the bell's mouth, and striking against the inner surface of the bell, make a noise that can be heard at quite a distance; whistling-buoys are fitted with an apparatus by which air compressed by the movement of the waves is made to escape through a whistle, and so give warning of danger. In the waters of the United States the following system of placing buoys as aids to navigation is prescribed by law: Red buoys mark the starboard or right-hand side of a channel when *coming* from seaward, and black the port or left-hand side; mid-channel dangers and obstructions are marked with buoys having black and red transverse stripes, and mid-channel buoys marking the fairway have longitudinal black and white stripes; buoys marking sunken wrecks are painted green; buoys marking anchorage limits or dumping limits are painted white. The quarantine buoy, if there be one, is painted yellow. The starboard and port buoys are numbered from the seaward end of the channel in large white or black numbers, the black having the odd white numbers, and the red the even black numbers. The life-buoy now in common use in the navy consists of two hollow copper vessels, connected by a framework, and having between them an upright pole, weighted at the bottom and surmounted by a brass box containing a port-fire. This machine is hung over the stern of the vessel, and can be dropped by means of a trigger. At night the burning of the port-fire serves to point out its position. An anchor-buoy is a small metal buoy made fast to the anchor by means of a rope, and it is used to mark the position of the anchor, so that should the riding-chain part, the whereabouts of the anchor is still indicated by the buoy.

BUOYANCY, of ships, is the amount of weight which can be buoyed up by the hull. The B. of a vessel is proportionate to the weight of water displaced by its presence (see **HYDROSTATICS**), and is found in this way: The cubic feet of the part of a vessel to be immersed being known, multiply it by the weight of a cubic foot of water (62.5 lbs.), and the product will be the weight of water displaced. From this subtract the weight of the vessel, and the result will be the B. or the weight a vessel will carry without sinking lower than the given line. It is admitted, however, by naval architects, that all the old rules concerning B., displacement, and flotation, must undergo modification by the introduction of iron ships, paddle and screw propulsion, and the increased weight of broadside.

BUPALUS AND ATHENIS, Greek sculptors, 540 B.C., in the isle of Chios. They were brothers, and sons of Anthermus, also a sculptor. As they produced only draped figures, it is inferred that the art had not advanced so far as to attempt nude subjects. It is said that B. made a caricature of the poet Hipponax, who was naturally intensely ugly, and that the poet retorted by verses that drove the sculptor to suicide.

BU'PHAGA. See BEEFEATER.

BUPHONIA, or **DIIPOLIA**, a religious festival held in Athens on the 14th July, when the very old ceremony of sacrificing an ox to Zeus was observed.

BUPRESTIS, a Linnæan genus of coleopterous (q.v.) insects, now divided into a number of genera, and forming a tribe or family, *buprestida*, of which some hundreds of species are known, most of them belonging to tropical countries, and remarkable for the splendor of their colors. The colors are generally metallic in their lustre, have frequently a burnished appearance, and are often beautifully iridescent. One of the largest species, *B. gigas*, is a native of Cayenne: it is about 2 in. long. The English and other European species are all comparatively small. Most of the species spend the night on trees, shrubs, and other plants, flying about during the hottest part of the day. Some of them are popularly known as **GOLDEN BEETLES**. Plants are sometimes seen studded with them in the morning, as with gorgeous flowers. The golden *elytra*, or wing-cases (see **COLEOPTERA**), of some species are used in the embroideries of the Indian *zenana*; and the lustrous joints of the legs are strung on silken threads, and form necklaces and bracelets of singular brilliancy. The species of *buprestida* found in England are few; none have yet been found in Scotland. The larvæ seem sometimes to be transported from one country to another in timber. See *illus.*, **BEETLES**, ETC., vol. II.

BUR, in an engraving, is a slight ridge of metal raised on the edges of a line by the *graver* or the *dry point*. As the B. produces an effect like a smear, it is usually regarded as a defect, and scraped off. Some etchers, however, take advantage of it to deepen their shadows, and Rembrandt made use of it in this way with telling effect.

BURANHEM, or **BURUNHEM**. See **MONESIA BARK**.

BURANO, an island and t. of northern Italy, in the Adriatic, about 5 m. n.e. of Venice. The island supplies a large proportion of the vegetables consumed in Venice. B. has some lace-manufactures and boat-building, but the inhabitants are chiefly employed in fishing. Population of town, 5000; of commune, 7000.

BURBAGE, or **BURBADGE**, **RICHARD**, an eminent English actor, born about 1567, was the son of James Burbage, an actor, and the first to receive a royal license (1574). Richard made his debut about 1588, and in 1599 converted Shoreditch theatre into the afterwards famous "Globe," having Shakespeare as one of his business associates. He acted there and at Blackfriars till his death abt. 1618; took leading parts in the best plays of the period, and was especially noted for his performance of Richard III. The Felton portrait of Shakespeare is attributed to him.

BURBOT, *Lota vulgaris*, a fish of the same genus with the ling (q.v.), and of the same family with the cod, haddock, etc., being the only British fresh-water species of that family, *gadidae*. It is found in the Cam, the Trent, and other rivers of the eastern and midland counties of England, but is one of the most local of British fresh-water fishes. It is found also in various parts of the n. of Europe, and at least as far s. as Switzerland; in Siberia and other parts of Asia, even, it is said, in India. In English rivers, it often reaches 2 or 3 lbs. in weight, but has been taken of 8 lbs. weight; and in some parts of Europe, it is said to reach 10 or 12 lbs. weight. In appearance, the B. very much resembles the ling, but is rather thicker at the neck, and tapers rather more rapidly, although still of a somewhat elongated form. It has two dorsal fins, the first short, the second very long, and a very long anal fin.

BURBRIDGE, **STEPHEN GANO**, b. Ky., 1831; bred to the law, but engaged in mercantile business and farming. When the civil war opened, he entered the union service, and was distinguished for bravery in many engagements. He was brevetted major-general of volunteers in 1864, and resigned in 1865.

BURCHARD, **SAMUEL DICKINSON**, D.D., b. N. Y., 1812; was educated in Kentucky, where also was his first labor as a minister. During the yellow fever epidemic in the South he remained faithfully at his post while others fled. In 1839, he became pastor of the Houston street Pres. Church, New York; in 1879, he was made pastor of the Murray Hill Church; but, 1885, he withdrew from active service, and became pastor emeritus. Dr. B. became widely known during the Blaine-Cleveland campaign by his alliteration, "Rum, Romanism, and Rebellion," with which he charged the Democratic party at a Republican meeting in which he had unexpectedly been called to speak a few days before the election. The sentiment of this alliteration was attributed to Mr. Blaine on leaflets which his opponents immediately scattered by myriads among the Irish voters who had been favorable to him. At different periods he was chancellor of Ingham University and president of Rutgers Female Seminary. He died in 1891.

BURCKHARDT, **JOHN LEWIS**, an enterprising African traveler, was b. at Lausanne, in Switzerland, Nov. 24, 1784. In 1806 he went to London, and was introduced by sir Joseph Banks to the African association, which accepted his services to explore the

route of Hornemann into the interior of Africa, and he embarked for Malta, Feb. 14, 1809. He had previously qualified himself for the undertaking by a study of Arabic, and also by inuring himself to hunger, thirst, and exposure. From Malta he proceeded, under the disguise of an oriental dress and name, to Aleppo, where he studied about two years, at the end of which time he had become so proficient in the vulgar Arabic, that he could safely travel in the disguise of an oriental merchant. He visited Palmyra, Damascus, Lebanon, and other remarkable places, and then went to Cairo, his object being to proceed from thence to Pezzan, and then across the Sahara to Sudan. No opportunity offering itself at the time for that journey, he went into Nubia. No European traveler had before passed the Derr. In 1814, he traveled through the Nubian desert to the shore of the Red sea and to Jeddah, whence he proceeded to Mecca, to study Islamism at its source. After staying four months in Mecca, he departed on a pilgrimage to Mt. Arafat. So completely had he acquired the language and ideas of his fellow-pilgrims, that, when some doubt arose respecting his Mohammedan orthodoxy, he was thoroughly examined in the Koran, and was not only accepted as a true believer, but also highly commended as a great Moslem scholar. In 1815, he returned to Cairo, and in the following year ascended Mt. Sinai. The Fezzan caravan, for which he had waited so long, was at last about to depart, and B. had made all his preparations for accompanying it, when he was seized with dysentery at Cairo, which terminated his life in a few days, Oct. 15, 1817, at the early age of 33. As a holy *sheik*, he was interred with all funeral honors by the Turks in the Moslem burial-ground. His collection of oriental MSS., in 350 volumes, was left to the university of Cambridge. His journals of travel, remarkable alike for their interest and evident truthfulness, were published by the African Association. B. was a man born to be a traveler and discoverer; his inherent love of adventure was accompanied by an observant power of the highest order. His personal character recommended him to all with whom he came in contact, and his loss was greatly deplored, not only in England, but in Europe. His works are—*Travels in Nubia*, 1819; *Travels in Syria and the Holy Land*, 1822; *Travels in Arabia*, 1829; *Notes on the Bedouins and Wahabis*, 1830; and *Manners and Customs of the Modern Egyptians*, 1830.

BURDACH, KARL FRIEDRICH, 1776-1847; b. in Leipsic, physiologist. After graduating in medicine at Leipsic in 1800, he became in 1811, professor of physiology in the university of Dorpat. He spent the greater part of his life, however, in Königsberg, where he filled the corresponding chair in the university, and accomplished most of his scientific labor. Later he was transferred to the university of Breslau. His writings are profound and original.

BURDEKIN, a river in n.e. Australia, in the colony of Queensland, about 350 m. long, falling into Upstart Bay.

BURDEN, a term of law in Scotland, used to signify any restriction, limitation, or incumbrance affecting either person or property. Burdens are said to be either personal or real. Where a party is taken bound by acceptance of a right to pay a certain sum to another, but where there is no clause charging the subject conveyed with the sum, the burden is said to be *personal*; that is, it will be binding upon the receiver and his representatives, but will constitute no real incumbrance on the lands, or other subject conveyed, nor amount, indeed, to anything more than a mere personal obligation on the grantor. But where the right is expressly granted under the burden of a specific sum, which is declared a burden or charge on the lands themselves, or where the right is declared null if the sum be not paid, the burden is said to be *real*.

BURDEN, or BUR'THEN, of a ship. See **TONNAGE**.

BURDEN, HENRY, 1791-1871; b. Scotland; son of a farmer; came to the United States in 1819, and the next year made the first cultivator used in agriculture in this country. His inventions include improvements in plows, a machine for making iron spikes, and one for fashioning horseshoes which produced 60 shoes per minute from the bar. He was agent and afterwards proprietor of the Troy iron and nail works, one of the largest manufactories in the world. He devoted much attention to steam navigation, and built, in 1833, a steamboat which from its shape was called the "cigar boat," but it was lost before its speed had been fairly tried.

BURDEN OF PROOF, in legal procedure, signifies the obligation to establish by evidence certain disputed facts; and, as a general rule, this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, according to the maxim *ei incumbit probatio qui dicit non qui negat*—that is, proof is incumbent on him who asserts, not on him who denies. The principle of the law is, that the B. of P. is on the party who would fail if no evidence were adduced on either side. Accordingly, it almost always rests on the plaintiff in an action, or on the party asserting the facts on which the result of the litigation must depend. In one case tried before the late baron Alderson, that learned judge laid down that the proper test was, *which party would be successful, if no evidence at all were given?* the B. of P., of course, falling on the party not in that position. This test has since been generally adopted and applied; but Mr. Best, in his learned work on the *Principles of Evidence*, improves on it by the suggestion, that in strict accuracy the test ought to be, "which party would be successful, if no evidence at all, or no more evidence, as the case may be, were given?" a consideration on which the discretion and judg-

ment of counsel frequently depend. But although such, in general, is the position of the plaintiff, it sometimes happens that the B. of P. is imposed on the defendant, and in consequence of his having the affirmative of the material issue to be tried.

In addition to what has been said it may be noticed that the obligation of the party upon whom the B. of P. rests is different in civil and criminal actions. In civil suits the obligation of the B. of P. is overcome if the proof is such that the probability of the assertion is proven; or more exactly, it will be sufficient if the preponderance of testimony, all things considered, is in support of the view sought to be established. In criminal cases, on the other hand, it is necessary for the jury, in order to convict, to find that the evidence establishes the guilt of the prisoner beyond a reasonable doubt.

BURDER, Rev. GEORGE, an active and influential minister of the Congregational body, was b. in London, June, 1752. After studying some time as an artist, he devoted himself to the ministry, and in 1778 was appointed pastor of an independent church at Lancaster. He afterwards removed to Coventry, and in 1803 to London. Here he became secretary to the London missionary society, and editor of the *Evangelical Magazine*, the duties of which offices he discharged with great zeal, until failing health compelled him to resign. B. took a prominent part in all the religious movements of his time. He died May, 1832. His *Village Sermons* have been translated into several European languages; and he was the author of other series of sermons and publications which have had an immense circulation.

BURDETT, Sir FRANCIS, Bart., the most popular English politician of his time, b. Jan. 25, 1770. Educated at Westminster school and Oxford university, he spent some years on the continent, and was a witness to the progress of the first French revolution. In 1793, he married Sophia, youngest daughter of Thomas Coutts, esq., the wealthy London banker, and in 1796 was elected M. P. for Boroughbridge, Yorkshire. In 1797, on the death of his grandfather, he succeeded to the baronetcy. In the house of commons, he made himself conspicuous by his opposition to government and the war, and his advocacy of parliamentary reform, Catholic emancipation, and other liberal measures, most of which were afterwards carried. One of the most effective political speakers of that excited period, he for many years prominently occupied public attention, and was the idol of the London populace. Having succeeded in obtaining a parliamentary inquiry into the abuses of the metropolitan prisons, he became, in 1802, a candidate for Middlesex. He was first returned, then unseated, and after a second contest, defeated. At the general election of 1806, B. again became a candidate for Middlesex, but was defeated. In May, 1807, he fought a duel with Mr. James Paull, one of the candidates for Westminster the previous year. Soon after, he was returned, with lord Cochrane, for Westminster, which he represented for nearly 30 years. B. having in 1810 published, in Cobbett's *Political Register*, a letter to his constituents, declaring the conduct of the house of commons illegal in imprisoning John Gale Jones, the speaker's warrant was issued for his apprehension, as being guilty of a breach of privilege. Refusing to surrender, he for two days barricaded his house; the populace supported him in his resistance, and in a street contest between them and the military some lives were lost; but on April 9, the sergeant-at-arms, aided by the police and military, obtained an entrance, and conveyed him to the Tower. The prorogation of parliament restored him to liberty. Prosecuted in 1819 for a libel contained in a letter to his constituents, strongly animadverting on the proceedings of the magistrates and yeomanry at the memorable Manchester meeting, he was sentenced to three months' imprisonment in the King's Bench, and to pay a fine of £1000. In 1835, he deserted the liberal party, and joined the conservatives. In 1837, he was returned for Wiltshire. He died in 1844.

BURDETT-COUTTS, the Right Hon. ANGELA GEORGINA, baroness, daughter of sir Francis Burdett, was b. in 1814. In 1837, she inherited much of the property of her grandfather, Thomas Coutts, the banker, on the death of his widow, who died duchess of St. Albans. The liberal and public-spirited use she has made of this wealth, in her efforts to mitigate the sufferings of her fellow-creatures and the lower animals, has rendered her name well known and deservedly popular. Besides spending large sums of money in building and endowing several churches and schools, she endowed the three colonial bishoprics of Cape Town, Adelaide, and British Columbia, at an outlay of about £50,000, and founded an establishment in South Australia for the improvement of the aborigines. In her zeal for the good of her own sex, she effected important reforms in the teaching of girls at the national schools, and established a shelter and reformatory for fallen women. To the city of London she has presented, besides several handsome fountains, the Columbia Market, Bethnal Green, for the supply of good and wholesome food in a poor district. She also built Columbia Square, consisting of model dwellings at low rents, for about 300 families; and, taking great interest in emigration, has assisted many poor families in their passage and outfit. Her private charities have been on a corresponding scale; and she is also a liberal patroness of art. In 1871, she accepted a peerage from government, with the above title. In 1872, the freedom of

the city of London was conferred upon her (the first woman who ever received it); and in 1874 the freedom of Edinburgh. She married W. L. Ashmead-Bartlett (b. in N. J.), in 1881.

BURDETTE, ROBERT JONES, b. Greensboro, Penn., 1844: educated at the High school, Peoria, Ill.; served as a private soldier during the war; in 1868 became night editor of the *Peoria Daily Transcript*. In 1873 he joined the staff of the Burlington, Iowa, *Hawkeye*, and soon made that paper famous by his humorous paragraphs. He became a popular lecturer, and published *The Rise and Fall of the Moustache*, *Hawkeyes*, a burlesque *Life of William Penn*, *Innach Garden*, etc.

BURDICK, a co. in north-western S. Dakota, formed in 1883; watered by the Little Missouri and Grand rivers.

BURDOCK, *Arctium*, a genus of plants of the great natural order *compositæ* (q.v.), tribe *cynarocephalæ*. The heads of flowers are globose, or nearly so; and each of the scales of the involucre runs out into a long rigid prickly, which is hooked at the point. By means of these hooks, the flower-head, popularly called a *bur*, readily lays hold of the clothes of a passer-by, the wool of a sheep, or the like, and thus the seeds are transported from one place to another, the short hairy pappus being insufficient to waft them far on the wind. The common B. (*A. lappa*), of which varieties very slightly distinguished have sometimes been described as species (*A. bardana*, etc.), is abundant in waste and bushy places, by waysides, etc., in Britain and throughout Europe, scarcely, however, growing except in rich land. Its root is biennial, large, and fleshy, somewhat carrot-shaped; the root-leaves large, stalked, heart-shaped; the stem stiff, upright, somewhat branched and leafy, 3 ft. or more high. The whole aspect of the plant is coarse, and it is somewhat clammy to the touch. The root is sometimes used in medicine, being diaphoretic and diuretic, and acting upon the cutaneous system and the kidneys. It is capable of being made a substitute for sarsaparilla. When fresh, it has a disagreeable smell, but when dry it is inodorous; it has a sweetish mucilaginous taste, becoming afterwards bitterish and rather acrid, and contains chiefly inulin, bitter extractive, mucilage sugar, and a little tannin. In many countries, the roots, young shoots, and young leaves of B. are used in soups; and the plant is cultivated for this use in Japan. The roots are said to resemble artichokes in taste. The leaves and their expressed juice are sometimes applied to burns and suppurations.

BURDWAN', a city in the district and province of the same name, in the government of Bengal, on the Grand Trunk road from the Hoogly to the n.w. provinces, in lat. 23° 12' n., and long. 87° 56' e., 74 m. from Calcutta, with which it is connected by railway. In point of architecture, it is a miserable place—an aggregate, as it were, of second-rate suburbs. Pop. 34,500.

BURE, or **BUR**, a mythical being who stands in Norse mythology as the grandfather of Odin, the supreme deity in that religion. The larger portion of Snorrio Sturleson's work known as the *Younger* or *Prose Edda* (in distinction from the poetical or *Elder Edda*) is devoted to the *Footing of Gylfi*, and these two older and younger Eddas correspond in that old heathen religion very nearly to the old and new testaments in Christianity. It is not in place here to tell all the strange adventures of Gylfi in his search for the origin of things, but only so far as concerns Bure. Gylfi (who was a king of Svithiod, or Sweden) journeyed to Asgard (the home of the gods) in search of knowledge, and the gods, knowing of his coming and his purpose, were ready to answer him. After he had been satisfied about the gods, their number and attributes, Gylfi asked about their origin. He was told that, many ages before the earth was made, Nifheim (the nebulous or shadowy region) was formed; that in the middle of Nifheim was a spring called Hvergelmur (the roaring cauldron), from which twelve rivers flowed. When the rivers had flowed far from their sources the venom which they rolled along hardened, as does the dross that runs from a furnace, and became ice. The ice stood still, and the vapor that gathered over it froze into rime, or frosty-snow, and in this manner were formed in Ginnunga-Gap (the yawning abyss, or all space) many layers of congealed vapor, piled one upon another. But the southern part of Ginnunga-Gap was filled with sparks and flashes of fire that flew into it from Mushellheim (the home of elemental fire). In the conflict of elements the rime was melted and the melted drops took a human semblance, and the being thus formed was named Ymir (the primordial giant). Another creature formed from this conflict of heat and cold was a cow named Audhumla (darkness), and from her teats ran four streams of milk, on which Ymir was fed. "But," asked Gylfi, "on what did the cow feed?" The answer was that she supported herself by licking the surrounding stones, which were covered with hoar-frost and salt. The first day she licked there appeared the hair of a man; the second day the head came to view; and the third day the whole man appeared. This man was called Bur or Bure ("born," whence old German "barn," and Scottish "bairn," a child). This first creature in the form of a man was the father of Bör (also meaning born), who took for his wife Besla, the daughter of the giant Bolthorn (calamity or evil), and this pair were the parents of Odin, the Norse allfather, and his brothers Veli and Ve. No wife is named for Bure, nor is anything further related of him.

BUREAU, a French word signifying a writing table or desk; also, an office for transacting business, a department of government or the officials that carry it on. **BUREAU-**

CRACY is popularly applied to signify the kind of government, exemplified in many continental states, where a host of government officials, regularly organized and subordinated, and responsible only to their chiefs, interfere with and control every detail of public and private life—the evil which the Germans call “much-government” (*viel-regieren*).

BUREAU, a co. in n.w. Illinois on the Illinois river; 870 sq.m.; pop. '90, 35,014; level and fertile, with little timber; the chief business is agriculture. It is intersected by the Chicago and Rock Island and other railroads. Co. seat, Princeton.

BUREAU, **ACHILLE**, 1835–88; foundryman; b. France; served an apprenticeship in Brussels; emigrated to Pennsylvania; entered the union army at the outbreak of the civil war, serving as private in the 18th volunteer regiment; in 1878 established a foundry in Philadelphia, in which were produced the first large pieces of bronze statuary cast in this country, among them the statues of Shakespeare in Central Park, N. Y., Gen. Thomas at Washington, and Gen. Reynolds at Philadelphia, and the Indian group at Chicago.

BUREL, or **BUREAU** (O. Fr. *burel*, russet color, from Lat. *burrus*, dark red), a cloth manufactured in England in the middle ages for cloaks and other outer garments; generally of coarse texture.

BURETTE, a tube used in assay offices, laboratories, and pharmacies, for dividing a liquid into small quantities, or for transferring minute portions of it. Gay-Lussac was the inventor, and the form approved by him consists of a large glass tube, graduated to $\frac{1}{100}$ and $\frac{1}{1000}$, having a smaller tube parallel to the first and communicating with it at the lower end. (See illustration, *CHEMISTRY*, vol. III., fig. 3.) Mohr substituted a simple divided tube provided below with a caoutchouc tube closed by a spring clamp of brass wire. Where a great number of analyses of the same kind are performed, this form of B. is preferred, but inasmuch as some solutions act upon caoutchouc, Gay-Lussac's B. is better where a great diversity of analyses occur.

BURG, a t. of Prussia, in the province of Saxony, situated on the Ihle, about 13 m. n.e. of Magdeburg. It is walled, and has long been famous for its extensive woollen manufactures. It has also manufactures of linen, yarn, steel, pottery, and leather; dye-works, distilleries, foundries, etc., and a large trade in farm produce. Pop. '90, 17,572.

BURGAGE TENURE is a species of holding in the law of real property which prevailed both in England and Scotland, although somewhat differently regarded in these two countries. In England, it is a species of free *socage* (q.v.) holding, and it prevails where the king or other person is lord of an ancient borough in which the tenements are held by a certain and determinate rent, and subject to a variety of customs, the principal and most remarkable of which is that called *Borough English* (q.v.). Among the other customs was a law that the wife shall be endowed with all her husband's tenements, and not with the third part only, as at common law.

In Scotland, by this tenure is meant a peculiar sort of military holding affecting property in royal burghs, the sovereign being superior or over-lord, and each individual proprietor or burgess holding direct of the crown, for the *reddendo* or service of *watching and warding* (q.v.). This service is otherwise termed “service of burgh used and wont,” and is now merely nominal. Although the burgesses hold immediately of the crown, they do not receive their formal entry directly from the sovereign, but from the magistrates of the burgh, as the crown's commissioners. If the burgh, as such, ceases to exist, the crown does not thereby lose its rights over the proprietors, for they continue as crown vassals (q.v.). The statutes 31 and 32 Vict. c. 101, and 32 and 33 Vict. c. 116, abolished many useless forms in this tenure. See **TENURE OF LAND**.

BURGAS, or **BURGHAZ**, a t. of Turkey, in the province of Eastern Roumelia, on a promontory in the Black sea, about 76 m. n.e. of Adrianople. B., which is well built and clean, has manufactures of pottery of a superior kind, and a good trade in agricultural produce. Pop. about 6500. The gulf of Burgas, at the head of which the town is situated, is about 14 m. in length, and has a depth varying from 5 to 12 fathoms.

BURGDORF (Fr. *BERTHOUD*), a t. in Switzerland, on the Emme, 14 m. from Bern. It is over 1800 ft. above sea level, and consists of a lower and an upper part, which are connected by spiral streets. There are an ancient castle, a town-house, hospital, library, etc.; also ribbon, tobacco, and chocolate manufactures, and a large trade in dairy products. In 1384 the town and countship were purchased by Berne for 37,000 florins, and the Bernese magistrates held rule until 1798. Pestalozzi had his school in the castle for a number of years. Pop. '88, 6875.

BURGEO ISLANDS, belonging to England, and lying between Newfoundland and cape Breton, in lat. 47° 33' n., and long. 57° 44' west. Besides being valuable as a fishing-station, they occupy a commanding position with respect to British North America in general, and the gulf of St. Lawrence in particular.

BÜRGER, **GOTTFRIED AUGUST**, one of the most popular German poets, was b. Dec. 31, 1747, at Molmerswende, near Halberstadt, in Prussian Saxony. In his boyhood, he displayed no capacity for hard study, and was particularly averse to Latin; but he at the same time showed a relish for verse, though destitute of any other model than the Psalm-book. In 1764, he went to Halle, and applied himself to theology. In 1768, he abandoned this science for jurisprudence, which he studied at Göttingen. Here his conduct

was careless and immoral, and he would probably have sunk into obscurity, if the intimacy which he happily formed with Voss, the two Stolbergs, and other young poets, had not stirred up his better nature, and inspired him with an earnest ambition to excel. He labored hard at the classics of ancient and modern times, but the study of Shakespeare and Percy's *Reliques* had the greatest influence in deciding the style of poetry which he was to adopt. With regard to the intrinsic merits of his poems, which consist chiefly of ballads and songs, even German critics—such as Schiller, Gervinus, and Vilmar—differ widely in their opinions; but all agree in praising the popular style and fluent, spirited versification of his ballads, *Leonora*, *Leonardo* and *Blandine*, the *Parson's Daughter of Taubenhayn*, the *Wild Huntsman*, etc. B.'s life was spent in great poverty and misery, partly the result of misfortune, and partly induced by his own errors. He married thrice, in two instances very unhappily; lost his property by an unfortunate speculation; and, though the favorite poet of the German people, was left to earn his bread by translations and similar literary labors. He died June 8, 1794. Though a popular writer, B. was very careful as to style, and was one of the first who wrote good hexameter verse in German. Since 1798, there have been numerous complete and partial editions of his works. See B.'s life by Döring (1826), and by Pröhle (1856).

BURGERS, THOMAS FRANÇOIS, 1834-81; b. Cape Colony; ex-pres. of the former Transvaal republic. He was educated at the univ. of Utrecht; made pastor of the Dutch Reformed Church of Hanover, Cape Colony; and on a trial for heresy was acquitted. B. was elected pres. of the Transvaal republic by the Liberals, succeeding Mr. Pretorius, and continuing in office until the annexation of the republic by the British, 1877. In theology B. held rationalistic views; while his presidential policy was remarkable for brilliant but impracticable schemes. See SOUTH AFRICAN REPUBLIC.

BURGERMEISTER, the German title of the chief magistrate of a city or town, analogous to the French *maître*, the English *mayor*, and the Scotch *provost*.

BURGERSDYK or **BURGERSDICUS**, FRANCIS; a Dutch logician, 1590-1629. He was professor of logic and moral philosophy, and afterwards of natural philosophy, at Leyden. His *Logic* was a valuable work; *Idea Philosophiæ Moralis* was a posthumous publication.

BURGES, TRISTAM, LL.D., 1770-1853; b. Mass.; a lawyer, and head of the Rhode Island bar; in 1815, chief justice of the state. In 1816, he was professor of oratory in Brown university; in 1825, elected to congress, where he served ten years. He was a ready, witty, and sarcastic speaker, and had many sharp discussions with the equally ready and sarcastic John Randolph. In 1839, he published *The Battle of Lake Erie, with Notices of Commodore Elliott's Conduct*.

BURGESS, a freeman or member of the corporation of a borough or burgh. The word is kindred to the French *bourgeois*, which has come to mean a member of the middle class. Distinction between a burgess and a citizen in the modern use of the words is slight. A burgess was one entitled to full rights of citizenship from his position as a householder or tradesman, and who had been duly enrolled on what is known as the *freeman's-roll*. In former times he was possessed of certain peculiar privileges under the feudal system (q.v.) not belonging to the unenrolled citizen. The term came to be to some extent applied particularly to municipal officers, and thence its use in denoting members of parliament returned from a borough, naturally sprang. In modern times when it is desired to honor a distinguished public guest it is customary to confer upon him "the freedom of the city" (q.v.), which is done by the honorary enrollment of his name as a burgess. In the United States the word is not of general use, though in Pennsylvania and Connecticut, where the borough is a distinct political division, the name burgess is used in the charters of such towns or villages to designate the chief local officer of the place.

BURGESS, ALEXANDER, D.D., b. Providence, R. I., 1819; graduated at Brown univ., 1838, and at gen. theol. sem., 1841; ordained priest, in Prot. Epis. church, 1843; rector of St. Stephen's church, East Haddam, Ct.; St. Mark's church, Augusta, Me.; St. Luke's church, Portland, Me.; St. John's church, Brooklyn, L. I.; Christ church, Springfield, Mass. He was pres. of the house of deputies, in the general convention of 1877; and was consecrated bp. of Quincy, 1878. He published a *Memoir* of his brother, the late bp. George Burgess, of Maine.

BURGESS, DANIEL, D.D., 1645-1712; an English dissenting divine, who openly avowed Presbyterian principles, and, in Ireland, frequently preached in defiance of the severe laws against non-conformity. He was imprisoned, and upon release went to London, where he soon gathered a large congregation by ardent zeal and the witty and ludicrous illustrations he used in his sermons. He was tutor of Henry St. John, afterwards lord Bolingbroke.

BURGESS, EDWARD, yacht-builder; born in West Sandwich, Mass., June 30, 1848; was educated at Harvard, graduating in 1871, and became secretary of the Boston Society of Natural History. In this capacity he devoted several years to editing the publications of the society, and writing certain anatomical memoirs. In 1879 he became instructor in entomology at Harvard, remaining until 1883. Financial reverses caused him to turn his attention to naval architecture, especially as to yachts. After some minor

victories, he was chosen to prepare plans for a sloop-yacht to represent the United States in a forthcoming international contest. From his designs the *Puritan* was built, which easily defeated the *Genesta* (English) and all competitors for the cup in 1885. The triumph was unprecedented, and attracted the liveliest attention. In 1886, his *Mayflower* easily led in the race against the English *Galatea*, which had been sent over to the United States to recover the America's Cup. All efforts to distance his vessels failed. In 1888, his *Carrie E. Phillips* distanced four competitors in the Fishermen's race held in Boston Harbor, and gained the title of "Queen of the Fleet." His *Volunteer*, launched in July, 1887, won the cup against the *Thistle*, the special product of British genius, in the international race of forty miles, raced in 1887. The *Volunteer* was nearly twelve minutes ahead. His latest productions were the *Mariguita*, *Minerva*, and *Gossoon*, all of them being remarkably swift sailing craft. He died in 1891.

BURGESS, GEORGE, D.D., 1809-66; b. R. I.; graduate of Brown University and tutor therein, afterwards studying in Germany. In 1834 he was rector of an Episcopal church in Hartford, Conn., and in 1847 became bishop of Maine, officiating also as rector of a church in Gardiner. He published *The Last Enemy Conquering and Conquered*; *Sermons on the Christian Life*; and a metrical version of a portion of the Psalms.

BURGESS, JOHN WILLIAM, educator, was born in Cornersville, Tenn., in 1844; studied at Cumberland University, and then at Amherst College, Mass., where he graduated in 1867. He turned his attention to law, and was admitted to the bar in 1869, when he spent two years as professor of English literature and political economy in Knox College. He went to Europe and devoted two years to study at Göttingen, Leipzig, and Berlin, when, returning to America, he became professor of history and political science at Amherst in 1873. In 1876 he accepted a similar position in Columbia College, New York, adding lectures on international law. In 1878, his title was changed to Professor of International and Constitutional Law and Political Science, and in 1890 he became dean of the faculty of Political Science. In 1892 he published a valuable treatise on political science and constitutional law, and in 1897 a work on United States history entitled *The Middle Period*.

BURGESS, NEIL, actor; was born in Boston, in 1846. He began his career on the stage at an early period in his life, and an accident turned his attention wholly to personating female characters. An elderly actress was taken suddenly ill one evening just before the curtain rose, and Burgess hastily assumed her role. The quaint humor he put into the work produced a sensation, and he decided to make a specialty of female character. *Josiah Allen's Wife* was written for him, but his greatest success was doubtless in *Widow Bedott*, in which he first appeared in Providence, in 1879, and at Haverly's, New York, the year following. *Vim*, an old play of his under a new name, was produced at the Bijou Opera House, New York, in 1883, and became very popular. In 1889, he produced *The County Fair*, a play that had a successful run of more than two years in New York theatres.

BURGH, another form of the word *Borough* (q.v.). Its use is confined chiefly to Scotch towns and cities incorporated in a manner similar to those of English boroughs. There were originally four classes of burghs: Royal Burghs, Burghs of Barony, Burghs of Regality, and Free Burghs. The first derived their corporate powers from a grant of the Crown; the second from that of a baron, temporal or spiritual; the third were originally Burghs of Barony, but by special royal grant had their powers greatly increased; the fourth, to which class all burghs of our day practically belong, originally asserted their own corporate freedom and were in general free from the great burdens of taxation, etc., common to the other forms of burghs.

BURGH ACRES are acres or small patches of land lying in the neighborhood of royal burghs (q.v.), usually feued or leased out to burgesses or persons resident within the burgh. A Scotch act of parliament, passed in 1695, relating to the division or partition of lands lying runrig, excepts burgh acres, or, as the act calls them, "burrow and incorporat acres," from its provisions; but this is to be understood only of royal burghs, and not of burghs of barony or others.

BURGHERS, a name popularly given to a religious denomination in Scotland. See UNITED PRESBYTERIAN CHURCH.

BURCKMAIR, HANS, a noted old German painter and wood-engraver, was b. at Augsburg, 1473. He was the father-in-law of the elder Holbein, and the friend of Albert Dürer, whose influence is manifest in B.'s works. Several excellent paintings by B. are preserved in the galleries of Munich, Berlin, Augsburg, and Vienna. But he is best known as a wood-engraver; his cuts amounting in all to nearly 700. Among the most celebrated of these is his "Triumph of the Emperor Maximilian," in 135 cuts, with a description by the emperor himself. Another fine series of 237 cuts, called "The Wise King," represents the deeds of Maximilian. B. d. at Augsburg, in 1531.

BURGLAR ALARM. See ELECTRIC BELLS.

BURGLARY, as a common law offense, was defined by Coke to be the breaking and entering by night into the mansion-house (that is, in modern parlance, dwelling house) of another with intent to commit a felony therein. Every essential word of this definition contains an element that is necessary to the completion of the crime. (1) There

must be a breaking, actual or constructive. But the breaking does not necessarily imply violence; thus, the lifting of a latch, or undoing of a window fastening, or even, the compelling by threats of violence of the unlocking of a door from the inside, constitutes a breaking. It has been said that it is a burglarious breaking to come down a chimney because it is "as much closed as the nature of things will permit." The breaking may even be for the purpose of exit; thus, if one enters a house by an open door with the intent to steal and it is afterward locked and he breaks his way out, he completes thereby the crime of burglary. To enter an open door or window or climb through an aperture already made is not a breaking. One who has lawfully entered one part of a house which is divided into separate residences may be held guilty of burglary if he break into another part. (2) The *entering* need not be of the whole person; the insertion of the hand, or even of an instrument or tool, for the purpose of completing the felony is sufficient to bring the offense under the head of burglary. Thus, where a man breaks a window and inserts a cane or hook to draw out goods, the offense is common-law burglary, other conditions agreeing. The entering need not, in time, be instantly after the breaking, but it must be connected with it as part of the criminal intent, as where a man breaks a window open on one night and returning the night after, completes the crime. (3) The building entered must be a dwelling-house, or a part thereof, in actual use as a residence, and to which the person accused has no legal right of entrance; for the purpose of the definition any out-house properly appurtenant to the dwelling is a part thereof. This would not include, however, a distant barn or disconnected store-house, or the like. Apartments under the same roof used for residence, and entered through separate outside doors form separate dwelling-houses in the legal sense; so are also suites of rooms in a college or lodging-house where the actual owner does not reside. A curious distinction was made by old English courts by which a church was held subject to burglary as being "the dwelling-house of God." (4) The breaking and entry must be in the night-time. This is considered to include the time between the disappearance of daylight and its re-appearance in the morning; daylight is further defined as existing when a man's face can be distinguished thereby; the existence or absence of moonlight has no effect in the consideration of this point as "the malignity of the offense does not so properly arise from its being done in the dark as at the dead of night." (5) There must be intent to commit a felony. It is immaterial whether the intended felony be larceny, arson, rape, or murder; but in the last three cases, as the offense is greater than that of burglary alone, the prosecution would naturally be for the most serious crime or its attempt. If no felonious intent exists, the breaking and entering in the night amount only to trespass. The common law limitation of burglary has been changed by the statutes of many of the United States; in some, common-law burglary and statute burglary exist side by side; in others, statute burglary is defined as of a second degree to common-law burglary. The extension of the definition of the crime in some states covers the breaking and entry in the day-time as well as the night, and of shops, factories, warehouses, etc., as well as of dwelling-houses. In a few of these states, burglary has been extended practically to cover the breaking and entry of any building at any time with intent to commit any crime. The punishment for burglary under the English law extended even to penal servitude for life; in this country in none of the states, we believe, is a sentence of more than twenty years' imprisonment laid down by the statutes.

BURGLEN, a village of Switzerland, in the canton of Uri, about 2 m. from Altorf. It is celebrated as the birthplace of William Tell.

BURGOMASTER. See GULL.

BURGONET. See ARMOR, HELMET.

BURGOO, a name used in some parts of the United States for barbecue (q.v.). The reader is also referred to Norton's *Political Americanisms* (1890).

BURGOS, a city of Spain, capital of the new province of the same name, and of the former kingdom of Old Castile, is situated in a fertile valley at the foot of the Sierra d'Oca, and on the right bank of the river Arlanzon, in lat. 42° 20' n., and long. 3° 45' w. Pop. '87, 31,301. B. is a very ancient place, having been founded in 844. Many of the gloomy old houses of its early history still remain. In the castle of B., Edward I. of England was married to Eleanor of Castile. The cathedral of B., founded in 1221, is one of the noblest specimens of Gothic architecture in Spain. Its various chapels are rich in fine sculpture and tombs. It was the birthplace of the Cid (q.v.).

BURGOYNE, JOHN, a British general and dramatist, b. 1723; son of lord Bingley, early entered the army, and in Aug., 1759, was appointed lieut.col. commandant of the 16th light dragoons. In 1761, he served at Belle Isle, and in 1762 commanded a force sent into Portugal for the defense of that kingdom against the Spaniards, when he surprised and captured Alcantara. In 1776, he served in North America, and in the summer of 1777 he was appointed to the command of a large force ordered to penetrate from Canada into the rebellious districts. The early part of the expedition was marked by his capture of Ticonderoga; but neglecting to preserve his communications with Canada, he encountered the greatest difficulties, and was at last obliged to surrender with his army to Gen. Gates at Saratoga. Soon after his return to England, having been denied an audience of the king, and refused a court-martial, he went over to the opposition party, and voluntarily resigned all his appointments. On a change of ministry, at the close of

the American war, he was appointed commander-in-chief in Ireland. This office he resigned two years after, and subsequently seems to have devoted his time to light literature. He was the author of some pamphlets in defense of his conduct, and of *The Maid of the Oaks* (1780); *The Heiress* (1786); and other stock dramatic pieces. B. was one of the managers for conducting the impeachment of Warren Hastings. He died in 1792. See *Episodes from the Life and Letters of B.*, by Barrington and Fonblanque (1876).

BURGOYNE, Sir JOHN FOX, Bart., an eminent English engineer, b. in 1782, entered the royal engineers in 1798. From 1800 to 1807, he served in the Mediterranean; was with Moore at Corunna in 1809; and served under sir Arthur Wellesley in the peninsula till the conclusion of the war in 1814, being present at all its sieges. In 1814 he was commanding engineer of the expedition to New Orleans, and in 1826 of that sent to Portugal. In 1851, he obtained the rank of lieutenant-general, and in 1854 was made D.C.L. of Oxford university. In the Crimean war, he was chief of the engineering department of the British army till recalled in 1855. For his services at Sebastopol, he received from the sultan the order of the Medjidie, and from the French emperor that of grand officer of the legion of honor. He was made gen. in 1855, and created a baronet in 1856. He died 7th Oct., 1871. Author of *Our Defensive Forces* (1868), etc.

BURGRAVE (Ger. *burg*, castle, fortress; *graf*, count), in feudal times in Germany, an officer appointed to the command of some fortress situated at some strong place or point otherwise important. Occasionally, the jurisdiction of the burgrave extended to the country immediately surrounding the stronghold proper. The burgraves were commonly subject to some ecclesiastical prince who had attained in the state the position of a graf (q.v.), but allowed the administration of those rights to be in the hands of the burgraves, who obtained the right of private justice and of imposing taxes. There were also royal burgraves. The most famous of the ecclesiastical burgraves were those of Mainz, Meissen, and Magdeburg; of the royal, the most noted was that of Nürnberg, held by the Hohenzollern family. The office of burgrave soon became hereditary.

BURGUNDY, the name of a once independent kingdom of wide extent, but most frequently used of an old French province (Fr. *Bourgogne*) now divided between the departments of Côte-d'Or, Saône-et-Loire, and Yonne. The ancient Burgundians (*Burgundi* or *Burgundiones*), originally a German tribe, were at first settled on the banks of the Oder and the Vistula, and afterwards extended themselves to the Rhine and the Neckar, and, in 407, penetrated into Roman Gaul. Their conversion to Christianity took place in the course of eight days! They adopted a brief Arian confession of faith, and were baptized. From 407 to 534, the kingdom of B. was several times divided; and in 451, Gundicar, king of B., with 10,000 men, confronted Attila, but was defeated and slain.

In 534, B. passed under the rule of the Franks; but the weak government of the later Carolingian kings allowed a part of it once more to assert a separate existence as a dependency of the empire under Boso of Vienne in 832. Boso's realm, known as Cis-juran B., or the kingdom of Arélate (Arles), lay mainly in the basin of the Rhone. A second Burgundian state arose about the same time in the country between the Saône and the Reuss, and was known as Transjuran or Upper Burgundy. These states, united in 930, were for a time powerful and famous; but in 1038, on the extinction of the royal dynasty, B. became part of the German empire. It was afterwards broken into several fragments, which were gradually absorbed by France.

A similar fate befell the third Burgundian state, the dukedom of B. or Lower B., which was formed by a brother of Boso. Yet the dukes of B. played a large part in the history of mediæval Europe, and were long the dangerous rivals of the French kings. The nucleus of the dukedom was in Lower B., the region which afterwards became the French province of B., to the n. and w. of the other Burgundian realms; but the second line of dukes, beginning in 1363 with Philip the hardy, son of the French king John, held under their sway not only Franche Comté and adjoining portions of France proper, but great part of the Low Countries. Charles the bold (q.v.) was one of the most powerful sovereigns of Europe. Louis XI. of France succeeded in incorporating the duchy with the kingdom of France.

BURGUNDY, LOUIS, Duke of, the grandson of Louis XIV. of France, and dauphin of France after the death of his father, was b. at Versailles in 1682. Even in childhood he was ungovernable, and became excessively violent and haughty, and abandoned to all gross and sensual passions. Although educated under the care of the abbé Fénélon, he used, when 30 years of age, to divert himself with drowning flies in oil, and blowing up living frogs with gunpowder. He had the misfortune to be deformed; his deportment and manners were undignified, and his mind was imbued with bigotry. When only about 15 years of age, he was married to the princess Adelaide of Savoy, and spent his time wholly in amusements in the company of his spouse, and of the ladies of the court. Nevertheless, in 1701, he was nominally appointed generalissimo of the army, really under the command of the duke de Vendôme, and is said to have shown some spirit in a cavalry-fight at Nimeguen; but he quarreled with Vendôme, chiefly because he had once been compelled to establish his headquarters in a nunnery. He lost the respect of the army, and was exposed to many humiliations, partly proceeding from intrigues set on foot against him out of envy by his father. He returned to the court more eccentric, gloomy, and unsocial than before. But when he became, on his

father's death, the second person in the kingdom, all his defects vanished from the sight of the courtiers, and flattery bestowed on him the title of the great dauphin. He died suddenly in the year 1712. A few days previously, his wife and her son, the duke of Bretagne, had died, and the same hearse carried father, mother, and child to St. Denis. The duke of Orleans, subsequently regent, and his daughter, the duchess of Berri, were accused, but without reason, of having caused them to be poisoned.

BURGUNDY PITCH, a resinous substance prepared from common frankincense (q. v.), the spontaneous exudation of the Norway spruce-fir (*abies excelsa*; see FIR) by melting it in hot water, by which means it is freed from a considerable part of the volatile oil which it contains. By straining it through a coarse cloth, impurities are also removed. B. P. is of a yellowish-white color, hard and brittle when cold, but softening by the heat of the hand, and readily adhering to the skin. It has a not unpleasant resinous odor, and a slightly bitter taste. It is used in medicine as an external application only, and generally acts as a mild irritant. A very common application of it is as a plaster in complaints of the chest, and in rheumatic complaints. It enters also as an ingredient with resin, oils, etc., into a compound plaster of similar use. The B. P. of commerce is now principally brought from Hamburg; but the greater part of what is sold under that name is really manufactured of common resin and palm-oil, or from American turpentine. It has a fuller yellow color than the genuine B. P., and a less agreeable odor.

BURGUNDY WINES are chiefly the produce of vineyards cultivated on the hilly lands forming the Côte d'Or, between Dijon and Chalons. These hills average about from 800 to 1000 ft. in height; the vineyards ascend up the slopes in terraces, and spread along the table-land on the summit. "In richness of flavor and in perfume, and all the more delicate qualities of the juice of the grape, the wines grown here unquestionably rank as the finest in the world." The most celebrated of the *red* wines of Burgundy are the Closvougéot (near Beaune), Nuits, Chambertin (the favorite wine of Louis XIV. as well as of Napoleon), the Romané-Conti, Richebourg, Volnay, and Pomard. Of other red wines of Burgundy not grown on the Côte d'Or, those of Pitoy, Perrière, Preaux, and Auxerre are held in most repute. The *white* wines of Burgundy are also the finest in France, but being produced in less quantity, they have less celebrity. A comparatively small portion of the wine produced is consumed in the district, the rest being exported to all parts of the world.

BURHÁNPUR, a t. in British India, 280 m. n.e. of Bombay, 21° 31' n., and 76° 20' e.; 2 m. from the railway station of Lalbagh. It was founded in 1400, and was the chief seat of the government of the Deccan provinces of the Mogul empire until 1635. In 1861, it was ceded to the British government. Pop. '91, 31,200. B. is celebrated for its muslins, flowered silks, and brocades.

BURIAL, a word of Teut. origin (Ang.-Sax. *birgan*, to conceal), is applied to the prevalent method among civilized nations of disposing of the dead, by hiding them in the earth. As there is almost nothing else so deeply interesting to the living as the disposal of those whom they have loved and lost, so there is perhaps nothing else so distinctive of the condition and character of a people as the method in which they treat their dead. Hence, funeral customs associate themselves with a wide variety of sentiments, from gentle and rational sorrow, up to deification of the departed, accompanied sometimes with cruelty and ferocity towards the living. People of a low and barbarous type carelessly permit the remains of the dead to lie in the way of the living, and there are a few instances in which the object of artificial arrangements has been to preserve a decorated portion of the body—as, for instance, a gilded skull—among survivors. The general tendency of mankind, however, has always been to bury the dead out of sight of the living; and various as the methods of accomplishing this end have been, they have resolved themselves into three great classifications: 1. The simple closing up of the body in earth or stone; 2. The burning of the body, and the entombing of the cinders; and, 3. The embalming of the body. The first of these seems to be the earliest form of which we have any record, and it is the form most amply sanctioned by the existing practice of the civilized world. It is the method referred to in the earliest scriptures: and all are familiar with the touching scene in which Abraham buries Sarah in the cave in the land of Canaan which belonged to Ephron, but was, after a solemn and courteous negotiation, secured to Abraham for a possession to bury his dead in (Gen. c. 23). The horrible fate of being left unburied, either from scorn or neglect, is powerfully told in the prophecy of Jeremiah against Jehoiakim: "He shall be buried with the burial of an ass, drawn and cast forth beyond the gates of Jerusalem." There is frequent allusion in the later scriptures, and especially in the New Testament, to the embalming of the body in antiseptics and fragrant substances; and the burning of the bodies of Saul and his sons is accounted for by commentators on the supposition that they were too far decayed to be embalmed. The Israelites may have learned the practice of embalming from the Egyptians, among whom it was an art so greatly cultivated and extensively practiced, that Egyptian corpses, as inoffensive as any article of wood or stone, are scattered over Europe in museums, and are even to be found as curiosities in private houses. The soil and climate of upper Egypt seem to have afforded facilities for

embalming unmatched in any other part of the world; and in other places the vestiges of the practice are comparatively rare, though it is usual even yet to embalm royal corpses, and in some places to preserve a series of mummies, as in the vault of the monastery of Kreuzberg, at Bonn, where the monks have been successively preserved in their costume for centuries. The practice of incremation, or of the burning of the body, and the entombing of the ashes, deserves more inquiry than it has yet obtained. In Greece, in Etruria—both before and after it came under the Romans—and in the n. of Europe, the simple burial of the body, and its prior reduction to ashes, were both practiced, and sometimes contemporaneously. The tombs of Etruria are rich in art, most of it going to the adornment of the urns of baked clay in which the ashes of the dead are kept. Vessel of *terra-cotta*, or cooked earth, containing human remains, have been found, often so large that they appear to have served as coffins for containing the whole body. Vessels of this kind were found in the valley of the Scamander by some British officers while spending their leisure time after the siege of Sebastopol, upon the ground supposed to have been occupied by the besiegers of Troy. Smaller cinerary urns have been found over so extensive a portion of the world, that it is difficult to define the limits to which they belong. The Danish antiquaries say, that in their stone period, when the use of metals was unknown, the dead were all buried unburned in stone chambers, and that the burning of the bodies and the preservation of the ashes in urns came in with the age of bronze. These antiquaries associate with the older system those amorphous mounds of earth or stone called barrows or tumuli, which are to be found all over the n. of Europe. Mr. Bremner, in traveling among the steppes of the Ukraine, saw multitudes of these small mounds, which reminded him at once of what he had seen on the plain of Troy, at Upsala in Sweden, in Scotland, and in Ireland. The Irish tumulus of New Grange is perhaps the most remarkable of all, forming a connecting link between the simple barrow on the moor and the pyramids of Egypt, which are the perfection of the same kind of structure applied to the same purpose—the burial of the distinguished dead. These structures open up a large field of curious inquiry. The simple theory, that they were raised over the dead, has lately been disturbed by the discovery that many of them are not artificial, but relics of sheets of alluvial matter, the mass of which has been carried away; and even in these, human remains have been found, the natural mounds having been used as monuments. Even when human remains are connected with barrows, cromlechs, or the large shapeless pillars commonly called Druidical, it is often questionable whether the monument was made to receive such remains. It is certainly ascertained to have been a practice in ancient times to bury bodies in tombs which were themselves ancient when they received their inmates.

Some of the grandest buildings in the world have been tombs; such are the pyramids, the castle of St. Angelo, the tomb of Cæcilia Metella, and many temples scattered over Hindustan and other eastern countries. Thus, the respect paid by the living to the dead has preserved for the world many magnificent fruits of architectural genius and labor. A notion that the dead may require the things they have been fond of in life, has also preserved to the existing world many relics of the customs of past ages. The tombs of Egypt have supplied an immense quantity of them, which have taught the present age more of the manners of ancient nations than all the learned books that have been written. It is an awful remembrance, at the same time, that inanimate things were not all that the dead were expected to take with them. Herodotus tells us of favorite horses and slaves sacrificed at the holocaust of the dead chief. The same thing has been done in our own day in Ashantee. In many countries, the wives had the doom, or privilege, as it was thought, of departing with their husbands; and down to the present generation the practice has lived in full vigor in the Hindu *sutti*. Among the Jews, the Greeks, the Romans, and many ancient nations, the dead were buried beyond the towns. The "stop, traveler" was a usual memorandum on Roman tombs. In Christian countries, if the remains of the saint to whom a church was dedicated could be obtained—or anything passing for the remains—they were buried near the altar in the choir. It became a prevalent desire to be buried near these saints, and the bodies of men eminent for their piety, or high in rank, came thus to be buried in churches. The extension of the practice was the origin of churchyards. See Feydeau, *Hist. des Usages Funèbres* (1856).

BURIATS, a Mongolian people in the vicinity of lake Baikal. They are scattered in various tribes that take the names of their special localities; and the tribes are subdivided according to kinship. Their number is estimated at 208,000, and they live chiefly in the Russian government of Irkutsk. They have high cheek-bones, flat noses, and sparse beard on the chin; they shave the head, leaving a cue at the top, like the Chinese. In summer they dress in wool and cotton; in winter in sheep-skins and furs. Rearing cattle is their chief occupation, and some of them possess large herds. The soil is fertile, and they have an elaborate system of irrigation. Some activity is shown in trapping and fishing. In religion they are mainly Buddhists, their chief lama living at Goose lake. Some are Shamanists, and their sacred spot is the Shamanist stone at the mouth of the Angar river. About 10,000 are Christians. Reading and writing are

general among the B., and they have books of their own, translated from the Thibetan. Their language is Mongolian, and in three distinct dialects. The Russians first explored the region in 1631, and permanently subdued the B. before the end of the 17th century. A grammar of their language was prepared by Orloff (1878). See *illus.*, ASIA, vol. I.

BURIDAN, JEAN, a scholastic metaphysician of the nominalist party, was b. at Bethune, in Artois, in the 14th c., and studied at Paris under Occam, where he also became a teacher of philosophy. The events of his life, as well as the manner of his death, are very obscure. One account states that he was thrown into the Seine by command of Marguerite de Bourgogne, daughter-in-law of Philippe le Bel, whose infidelities he had rebuked. Another, later, but less mythical-looking account, states that B. was driven from France as a disciple of Occam, and fled to Austria, where he founded a school. His elucidations of Aristotle are among his most useful writings. In his *Logic*, his great endeavor was to facilitate the discovery of middle terms for all kinds of syllogisms. The celebrated sophism known to the schoolmen under the name of BURIDAN'S ASS, has been discussed at superfluous length, and with needless ingenuity, by Bayle. It is not at all likely that it was ever adduced by B., but more probably by his adversaries, who wished to ridicule his metaphysical doctrine of *Determinism*—viz., that in every mental and bodily action the will must be determined by something out of itself. The sophism referred to is that if a hungry ass be placed exactly between two bundles of hay of equal size and attractiveness, it must starve, as there is nothing to determine the will of the animal towards either bundle. His chief works are *Summula Dialectica* (Paris, 1487); *Compendium Logice* (Venice, 1489; Oxford, 1637); *In Aristotelis Metaphysica* (Paris, 1518).

BURIN, or GRAVER, the principal instrument used in copper-engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The style of a master is frequently described by the expressions *soft B.*, *graphic B.*, *brilliant B.*, or whatever other character may belong to it.

BURITI PALM, *Mauritia vinifera*; see MAURITIA; a beautiful palm which grows in great abundance in the swamps of some parts of the n. of Brazil. It is one of the loftiest of palms. Its leaves are fan-shaped, and form a large globular head at the top of the stem. It produces a great number of nuts about the size of a small hen's egg, covered with rhomboidal scales arranged in a spiral manner. Between these scales and the albuminous substance of the nut, there is an oily reddish pulp, which is boiled with sugar, and made into a sweetmeat. An emulsion is also prepared from it, which, when sweetened with sugar, is a very palatable beverage, but if much used, is said to tinge the skin of a yellow color. The juice of the stem also makes a very agreeable drink; but to obtain it, the tree must be cut down, when several holes about 6 in. square, 3 in. deep, and 6 ft. apart, are cut in the trunk with a small axe; and these in a short time are filled with a reddish-colored liquid, having much the flavor of sweet wine.

BURKE, a co. in e. Georgia, on the Savannah river and the Central Georgia railroad; 1080 sq. m.; pop. '70, 17,639—13,436 colored; in '90, 28,501. Surface hilly, with fertile soil, producing corn, sweet potatoes, and cotton. Co. seat, Waynesboro.

BURKE, a co. in w. North Carolina, on the Catawba river and the Southern railroad; 620 sq. m.; pop. '90, 14,939, includ. colored. Surface mountainous, with fine scenery; productions agricultural. Co. seat, Morganton.

BURKE, EDMUND, a philosopher and politician, distinguished over all the men of his times for eloquence and political foresight, was b. 1728 or 30, in Dublin, where his father had an extensive practice as an attorney. As a schoolboy, he displayed those traits of character and the germs of those powers which ultimately gave him greatness. In 1744, B. entered the university of Dublin, of which he became a scholar. His undergraduate course was not unmarked by the ordinary distinctions of successful application; but it would appear that he mainly devoted himself to his favorite studies of poetry, oratory, history, and metaphysics. In Feb., 1748, he graduated B.A., and in 1751 took his degree as master of arts. In the interval (1750), being destined for the English bar, he proceeded to London, to keep his terms at the Middle Temple. To legal studies, however, he never took kindly, and ultimately he abandoned the idea of becoming a barrister. During the years 1750—56, he would appear to have occupied himself in traveling through England, enjoying the society of literary men, in study, and finally in writing for various periodicals.

B., when yet at the university, had achieved a local reputation for literary talent and eloquence. Among the compositions of his undergraduate life the most noticeable perhaps is his translation of the conclusion of the second Georgic of Virgil, which shows poetic talent of no mean order. His first important publication, however, was the celebrated *Vindication of Natural Society*, written in imitation and ridicule of the style and reasoning of lord Bolingbroke, in which, with well-concealed irony, he confutes his lordship's views of society by a *reductio ad absurdum*. This work, published anonymously in 1756, at the age of 26, attracted considerable attention. Soon after, in the same year, appeared his well-known essay, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*—a work containing a comprehensive induction of the various sources of the ideas referred to, but which must be pronounced a failure, so far

as it pretends to analyze into their primary elements the emotions of the sublime and beautiful.

The essay on the *Sublime and Beautiful* attained a rapid popularity, and its author soon found himself courted by all the eminent men of his time. Garrick was already one of his friends; among them he soon could count Reynolds, Soame Jenyns, lord Lyttelton, Warburton, Hume, and Dr. Johnson. Notwithstanding this popularity, however, his progress continued slow; for three years yet, he had to occupy himself with periodical writing, devoting his leisure principally to political subjects. What is considered a joint work of B. and his cousin, William Bourke, appeared in 1757—viz., *An Account of the European Settlements in America*—and shows how carefully at this date he had studied the condition of the colonies. In 1761, Mr. W. G. Hamilton ("Single-speech Hamilton"), then secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where, during two years' service, he demonstrated his aptitude for political business, receiving in 1763, in reward of his services, a pension on the Irish establishment of £300, which, however, he did not long enjoy.

Returning to London, B., in 1764, along with Reynolds, founded the literary club, the history of which is associated with almost every considerable name in the literature of the period. But literary society did not call off his attention from the chances of a political career. He became private secretary to the marquis of Rockingham, on his becoming premier, and at the same time entered parliament as member for Wendover. Here his eloquence at once made him the reputation of being "the first man in the commons." The Rockingham administration, however, lived only a few months, and with it terminated this his second political employment. To trace his subsequent career in parliament is more than the limits of this article will allow; it must suffice to state briefly that his parliamentary life extended from 1766 to 1794 without intermission; that he was successively member for Wendover, Bristol, and Malton; twice held the post of paymaster of the forces, once under Rockingham, and again under lord North, with the standing of a privy counselor; that after a career in parliament remarkable for the laboriousness, earnestness, and brilliancy with which every duty was discharged, and extending over nearly 30 years, he retired at last, receiving the thanks of the commons for his numerous public services, and rewarded by government, on the express request of his sovereign, with pensions amounting in all to £3700. It would be wrong, however, to omit that, as paymaster of the forces, he, with a scrupulous regard to public economy, sacrificed all the perquisites of his office, exhibiting a severe integrity unexampled among public men; and that in his relation with the constituency of Bristol, which was alienated from him by his advocacy of the claims of the Roman Catholics and of the opening up of the trade of Ireland, he was the first to maintain the doctrine of the independence of parliamentary representatives—that they are not machines to vote for measures approved by their constituencies simply for that reason, but men and thinkers chosen by them to calmly consider and legislate for the good of the commonwealth. It must also be mentioned, that during his career he rendered more important service to the cause of humanity than any man of his time; he prepared the way for the abolition of the slave-trade, a measure which was destined to ripen to success in the hands of Wilberforce; he advocated the cause of humanity in India against the voracious greed of stockholders, who regarded its millions simply as materials for plunder, and largely contributed to improve the government of that country. Towards America he advocated a policy of justice and conciliation, which, had it been adopted, would have averted the horrors of the war of independence, and retained the colonies in amity with the mother-country. And to the advocacy of every cause which he espoused, he brought a capacity for patient research that was unlimited, and an eloquence that has never been transcended.

Before proceeding to remark on the character and powers of B., a very brief notice must be taken of his leading literary efforts connected with his political labors. Little more than a catalogue can here be given of them. Omitting a variety of valuable letters—several on the condition of Ireland—notice must be taken of his *Observations on a Pamphlet on the Present State of the Nation*, being his first political pamphlet, published in 1769, in answer to one variously ascribed to Fox or Grenville. In 1770, he published a pamphlet, *On the Cause of the Present Discontents*. On the 13th Feb., 1788, he commenced his celebrated speech opening the trial of Warren Hastings (q.v.), the most remarkable trial, perhaps, in the history of the world. This speech lasted over four days, and has been characterized as "a tempest of invective and eloquence." No idea can be conveyed of the effect which it produced. The trial lasted seven years, and closed with another great and splendid oration from B., lasting over nine days. Hastings, it is well known, was acquitted. While this trial was advancing, B. found time to take part in all the current business. In 1790, appeared his *Reflections on the Revolution of France*, which sold in tens of thousands, and is said to have produced an effect never produced before nor since by any political essay. Hereafter, the world showered honors on B., of which space forbids even the enumeration. Having, in 1791, withdrawn from the whigs on the French question, he offered for the consideration of government, *Thoughts on French Affairs*, which, however, was not published till after his death. *Heads for Consideration on the Present State of Affairs and Reply to a Noble Lord* next followed, the latter being relative to himself personally. His last work,

Thoughts on a Regicide Peace, showed that he retained to the end of his life his whole powers unimpaired.

Few men have been the subjects of higher panegyric than B., and, on the whole, few have better deserved praise. He was noble-minded, pure in his life, and a purist in politics. Intellectually, he was most richly endowed; with much imagination, rare powers of observation, and indefatigable industry, there was no subject which he could not master, and none which, having mastered, he could not expound with unparalleled richness of language. But with these virtues and powers were conjoined defects, which, without bating their greatness, largely neutralized their influence. He was, it may be said, too literary to be a philosopher, and too philosophic to be a politician. His career would seem to illustrate this position. His oratory astounded by its brilliancy rather than persuaded by its tone and argument; and in the long-run, the eloquence which failed to command the reason, ceased to captivate the ear. The man who at first evoked the enthusiasm of the house by the brilliancy and power of his eloquence, did actually at last empty it by persistence in the monotonous splendors of his speeches. Passionate, and in a great degree untractable, he was unsuited for party politics, and drifted from all his connections, breaking up slowly all party ties, and even the ties of friendship, till he reached at last a state of almost political isolation. At the same time, it must not be forgotten how great an influence he, half philosopher, half politician, exercised on the counsels of the state; many of his views on politics and public economy were anticipations of science, as many of his previsions of the course of events were prophecies.

B. died on the 7th July, 1797. A collected edition of his works in quarto was published in 1827. The latest edition is from the Clarendon press, begun 1866. See Mac-knight's biography of B., and Morley's *Edmund Burke, a Historical Study* (1869).

BURKE, Sir JOHN BERNARD, b. 1815; son of John, who started *Burke's Peerage*, and continuing the work after the father's death. He was called to the English bar in 1839, became Ulster King of Arms in 1853, and was knighted in 1854. He published, besides the *Peerage and Baronetage*, *History of Dormant, Abeyant, Forfeited, and Extinct Peerages*; *History of the Landed Gentry*; *Vicissitudes of Families*, etc. He d. in 1892.

BURKE, THOMAS M., known as "Father Tom," 1830-83; b. Galway, Ireland; studied theology in Rome and Perugia; joined the order of St. Dominic, and after remaining five years in Italy was sent by his superiors to England. He soon established a reputation as an orator; preached in Ireland, England, and Italy; and, in 1872, visited the U. S., where his course of lectures in answer to Froude excited much attention. His lectures were reprinted under the title of *English Misrule in Ireland*, 1873.

BURKE, THOMAS MARTIN ALOYSIUS, clergyman; b. in Utica, N. Y., in 1840; educated at the college of St. Michael, Toronto, and at St. Charles college (Md.); ordained to the Roman Catholic priesthood in 1864; assigned to duty at Albany, N. Y.; became vicar-general of the diocese in 1887; and was consecrated the fourth bishop in 1894.

BURKING. A name given to the crime of murder committed for the purpose of providing surgeons with anatomical "subjects," so called from a murderer named Burke.

BURLEIGH, WILLIAM CECIL, Lord. See CECIL.

BURLESON, a co. in Central Texas, on Brazos river; 640 sq. m.; pop. '90, 13,001, incl. colored. It has an uneven but productive soil, about two thirds covered with oak forests. Productions, corn, cotton, and wool. Co. seat, Caldwell.

BURLESQUE (from Ital. *burlesco*, jest, mockery), denoting a style of speaking, acting, writing, drawing, is a low and rude grade of the comic. The legitimate comic brings together contrasts with a final view to harmonizing and reconciling them; the B. distorts and caricatures, and brings the incongruities into stronger relief. The farce is the B. of comedy. Deformities and monstrosities that excite disgust do not belong to the burlesque. The lofty and the abject, the great and the little are conjoined, with the sole view of exciting a laugh. Nor does the true B. turn real greatness and nobility into laughter, but only sham greatness—false pathos, and all hollow pretension and affectation. The B. style appears to have been unknown to the ancients; it originated among the Italians, more particularly with the poet Berni (q.v.). The genuinely national *buffone* of the Italians personates the burlesque. Carlo Gozzi, in his tragi-comedies, is perhaps the greatest in the B. vein. Scarron among the French, and *Hudibras* in English, are examples. Parody or travesty (q.v.) is a species of burlesque.

BURLETTA, a comic operetta or musical farce.

BURLINGAME, ANSON, LL.D., 1820-70; b. N. Y.; educated in Michigan and Harvard universities, and practiced law in Boston. He was chosen to the state legislature and the constitutional convention. He was an early worker in the free-soil party when Van Buren was the presidential candidate; and was also a leader in the American party in 1854, and by them sent to congress. His denunciation of Brooks's assault upon Senator Sumner provoked a challenge from the South Carolinian, which the Massachusetts member at once accepted, naming rifles as the weapons. Brooks did not fight. Burlingame was a congressman until 1861, and in that year was sent as minister to Austria, where the feeling against him because he had favored Hungarian independence led to a positive refusal to receive him as a diplomatic representative. He was then sent to China, where he was successful in negotiating certain treaties favorable to both countries, and for the first time securing China's recognition of international rights of property, trade and worship. In 1869, having gained the full confidence of the Chinese

government, he was sent as minister of the Chinese Empire to Russia and other European countries, but died in St. Petersburg soon after entering upon his duties.

BURLINGTON, a co. in central New Jersey, between the ocean and the Delaware River; 860 sq. m.; pop. 1890, 58,528. Co. seat, Mount Holly.

BURLINGTON, city and co. seat of Des Moines co., Iowa, on the right bank of the Mississippi river and on the Burlington, Cedar Rapids, and Northern, the Burlington Route, and the Toledo, Peoria, and Western railroads; 82 m. below Davenport. It was named from the city of Burlington, Vt., by its first settlers. A fur-trading post was established here as early as 1829; the first dwelling houses were erected in 1833; the town was incorporated Apr. 29, 1837, and the city chartered in Feb., 1838. It was the state capital 1837-40. B., sometimes called the "Orchard City," occupies a natural amphitheater, formed by the limestone bluffs that slope back from the river, and on which many of the residences are built, and is regularly laid out. The river here is broad and deep, and is spanned by a railroad bridge. Steamers run to St. Louis, St. Paul, etc., and the commerce is important. The industries are the manufacture of iron, machinery, wagons, wheels, desks, furniture, sawed lumber, etc., pork-packing, and the quarrying of limestone and coal found in the vicinity. There are large stock-yards at East B. There are national and savings-banks, a public library, high school, Y. M. C. A., Masonic and Odd Fellows halls, Burlington Univ., founded 1853, churches, and several newspapers. Pop. '90, 22,565.

BURLINGTON, city and port of entry in Burlington co., N. J., on the Delaware river, and the Pennsylvania railroad; 18 miles above Philadelphia. Burlington was settled in 1677, chiefly by Friends, and was first called New Beverly. It was long the seat of government of the colony of West Jersey, and was the residence of the last colonial governor, William Franklin, and for a long time carried on a lucrative trade with the West Indies. In 1776 the town was bombarded by the British. It was incorporated in 1784. The Delaware River is here nearly a mile wide, and contains an island of 300 acres. Bristol lies on the opposite side, and is connected with Burlington by ferry. The city contains some fine old mansions and old St. Mary's Church, which was endowed by Queen Anne. There are churches, a national bank, an opera house, a public library, Burlington College, founded in 1846, St. Mary's Hall (Protestant Episcopal), Van Rensselaer Seminary (Presbyterian), electric lights, and manufactories of shoes, stoves, iron pipe, terra cotta and canned goods. Pop. '90, 7264.

BURLINGTON, city, port of entry, and co. seat of Chittenden co., Vt., on Burlington Bay, the eastern shore of Lake Champlain, and the Rutland and the Central Vermont railroads; 40 miles n.w. of Montpelier. Burlington was settled in 1773, but not permanently inhabited until after the Revolution. The town was garrisoned during the War of 1812. In 1809 the second steamboat in America, the *Vermont*, was launched at Burlington. The city was incorporated in 1865. Burlington is beautifully situated on ground rising gradually from the lake to a height of 800 feet, and commands fine views of the Adirondack and Green Mountains. The streets are broad and well shaded, and in the center of the city is a large public square, around which cluster the handsome county court house, the city hall, the United States post-office and custom house, the Young Men's Christian Association building, and the principal hotels. The Roman Catholic Cathedral and St. Paul's Episcopal Church are the finest churches. The University of Vermont (q. v.), founded in 1791, has a commanding position on a hill 375 feet in height, within a park of seven acres. The Billings Library, designed by Richardson, is the most beautiful of the buildings. The view from the university tower is magnificent. The State Agricultural College forms part of the university. The principal libraries are the Fletcher Free Library, the University Library, and the Burlington Law Library. There are an opera house, two art galleries, churches, national and savings banks, a trust company, the Mary Fletcher Hospital, Home for Aged Women, Home for Friendless Women, Home for Destitute Children, Adams Mission House, Louisa Howard Mission, Providence Orphan Asylum, Cancer Relief Association, Lake View Retreat, Nervine and Rest Cure, several sanitariums, and many charitable associations. The educational institutions include a high and several graded schools, St. Joseph's Academy, St. Mary's Academy (both Roman Catholic), and the Vermont Episcopal Institute. Several daily and weekly newspapers are published. Burlington has two cemeteries—Lake View, situated near the lake, and Green Mount, overlooking the Winooski Valley, and containing the grave of Colonel Ethan Allen, with a monument. The Lake Champlain Yacht Club has a fine club-house near the lake. An artificial breakwater forms a safe harbor, and on Juniper Island, opposite the city, is a lighthouse. A bridge crosses the Winooski River to the manufacturing suburb of Winooski, famous for its large woolen mills. Burlington is one of the largest lumber markets in the country. Large quarries of marble, and other building stone in the vicinity furnish material for another important branch of its commerce. The manufactures are numerous and varied. Population, 1880, 11,365; 1890, 14,590.

BURLINGTON. See BRIDDLINGTON.

BURLINGTON LIMESTONE, a valuable material for building, found in abundance near Burlington, Iowa, and elsewhere along the Mississippi, usually in double beds, the upper one nearly all carbonate of lime, the lower one containing magnesia. This stone is peculiar for the abundance of fossils found in it, especially of crinoidea and corals.

BURMAH is the largest of all the provinces of the Indian empire. It stretches from 28° lat. on the confines of Thibet southward for 1100 m., to 10° lat. far down the Malay

peninsula, and from 103° long., on the Chinese border, for 700 m. westward to the bay of Bengal. It is coterminous with China and Siam on the e.; and for the rest it is bounded by the Indian provinces of Bengal and Assam, and by the ocean. Its total area is about 280,000 sq.m., of which one third belongs to the old province of lower B. and two thirds to the new province of upper B. The country consists of the great basin of the Irrawaddy and its affluents; the rugged country drained by the Salween and Sittang rivers, on the upper waters of which are situated the Shan states; and the narrow maritime provinces of Arakan and Tenasserim. The deltas of the chief rivers are flat plains. The level, cultivable plains probably do not exceed 50,000 sq.m. in all. The rest of B. is hilly, broken country covered with forest for the most part. There are large highland tracts, with a ruling elevation of 2000 to 4000 ft. The principal hill ranges are the Patkoi mountains in the n., which reach at one point to a height of 12,000 ft.; the China hills in the n.e., culminating in perpetual snow-peaks 15,000 ft. high; the Arakan Yoma range, running from Bengal to cape Negrais; the Pegu Yoma range; the Tenasserim range, running from the Salween river to the foot of the Malay peninsula; and lastly, the Shan states, a vast upland, cleft by deep chasms, in which flow the Salween and Cambodia rivers and their feeders. The chief river, the Irrawaddy, has a course of 1100 m. to the bay of Bengal, and is navigable all the year round by river steamers. The Salween, rising, like the former, in the Thibet snows, is navigable for only about 80 m. from the sea. The Sittang rises in the hills s.e. of Mandalay. All are traversed during the rainy season by thousands of native barges and boats. During the dry season only the largest rivers can be navigated.

Climate.—On the coast, only two seasons are known—the dry and the rainy, which are regulated by the n.e. and the s.w. monsoons; but in B. proper less rain falls, and there are three seasons—the cold, the hot, and the rainy. Some showers fall in May or June, but the great rains last from the middle of Aug. to the end of Oct. The cool season is from the middle of Oct. till the beginning of Apr., and from this month till the great rains is the hot part of the year, the thermometer ranging from 85° to 100°. The climate is, on the whole, healthy, but the jungles are very pestiferous.

Minerals.—B. possesses great mineral resources, but they have not yet been very productive. Throughout the whole of Lower B., where the officers of the geological survey have made a careful investigation, gold is found in small quantities by washing the river sand. Copper, lead, iron and tin are also found, and a considerable amount of petroleum, which is produced in large quantities along the Irrawaddy river and in Arakan. Jade, amber, and ruby mines exist, especially in Upper B., and an excellent quality of white marble is found near Mandalay, and is used in making images of Buddha and in ornamenting pagodas. There are veins of coal in the Shan states, on the Chindwin river and on the Irrawaddy above Mandalay. Some coal is found also in Lower B. There are remarkable ruby mines in a district north of Mandalay covering an area of about 200 sq. m. The mines have been worked in a rude fashion and the larger stones are royal property, but many are hidden and smuggled away. Since 1888 European machinery has been introduced in the working of these mines. Limestone is found in many parts of the country and good building stone abounds near Mandalay and in most of the districts outside the delta.

Vegetable productions.—A few only of the most striking of these can be noticed. Of the graceful palm-tribe (*palmeæ*), the cocoa-nut, the betel, the palmyra, and the nipa, or water-palm, are the most prized. The useful bamboo is widely diffused. The teak, of which B. possesses inexhaustible forests, and the hopœa, are amongst the most valuable of the timber-trees. Forests of pine grow to the eastward of Amarapura. The wood-oil tree is found on the higher Salween, one trunk of which will produce from 30 to 40 gallons of oil every season. The staple fruit of the country is the plainain or banana. The jack is prized by the natives. The mango reaches the height of 100 ft., and produces a delicious fruit. Rice, wheat, tobacco, indigo, and cotton are cultivated.

Animals.—The *felidæ*, or cat family, abound, tigers, leopards, and tiger-cats being met with in every part of the country. Of the *pachydermata*, the elephant and rhinoceros are the most noteworthy. The elephant, buffalo, and Indian ox have been domesticated.

Ethnology.—The Burmans belong to that branch of the Mongolidæ characterized by a monosyllabic language; they are short-headed, broad-skulled, and flat-faced. The hair is black, and the skin of a deep brown color. Their dress is simple, but peculiar. The *wa-gie*, a white linen jacket, is common to both sexes. Wrapped around the lower part of the body, the men wear the *put-so*, which is several yards in length; the women, the *te-mine*, a scant garment of cotton or silk. Silks, muslins, and valuable gold ornaments are worn on special occasions. Betel-nut chewing and cigar-smoking are greatly practiced by both men and women. The Burmans are, generally speaking, fine, well-made men, and excel in wrestling, boxing, rowing, foot-ball, and other athletic exercises; they are clever as carpenters and smiths. Burman houses are made of a framework of bamboo, thatched with the leaf of the water-palm, and are invariably raised on posts several feet from the ground. The women are more industrious than the men; they buy, sell, weave, and attend to the domestic concerns. Both sexes delight in merry-making, feasting, buffoonery, and sight-seeing. A *pooyay*, or theatrical representation, is a very favorite amusement, and a buffalo-fight attracts crowds of spectators. The Burman has little patriotism, but is attached to his home. Without individual cruelty, he is indifferent to the shedding of blood by his rulers. Though temperate and hardy, he dislikes disci-

pline and continued employment; and when in power, is too often arrogant, arbitrary, and corrupt.

Besides the true Burmans, a great variety of races inhabit the Burman territories. The most numerous, next to the Burmans, are the Shans, who are scattered over the country, but live chiefly in the highland regions. They resemble the Burmans, but are harder, more courageous, and poorer. The Karens were formerly in a condition of subjection to the Burmans, by whom they were despised and oppressed. They used to be nature-worshippers, but a large number of them have been converted to the Christian faith through the work of the American missionaries. The Kachins dwell in the highland regions of Upper B. They are warlike, and defend themselves with obstinacy against invaders. Among the other hill tribes may be mentioned the Singphos and the Paloungs, the latter being the most savage of the Shan tribes.

Religion.—Buddhism (q. v.) is the prevailing religion of B., where it has been preserved in great purity. Its monuments—temples, shrines, and monasteries—are innumerable; its festivals are carefully observed, and its monastic system is fully established in every part of the kingdom. While directing the reader to the special article on BUDDHISM for an account of its doctrines, history, etc., we may here glance at its development, institutions, and edifices among the Burmans. The Burman religion has the peculiar feature that it allows tolerance to other creeds, but permits no proselytism. At an early age every boy enters the temple or pagoda, and after learning to read and write becomes a monk, but is not required to remain. The temples, which are voluntarily supported, are very numerous.

The members of the monastic fraternity are known in B. as *pon-gyees*, meaning "great glory;" but the Pali word is *rahan*, or holy man. The pon-gyees are not priests, in the usual acceptance of the term, but rather monks. Their religious ministrations are confined to sermons, and they do not interfere with the worship of the people. They are a very numerous class, living in monasteries, or *kyoungs*, and may at once be known by their yellow robes (the color of mourning), shaven heads, and bare feet. They subsist wholly by the charity of the people, which, however, they well repay by instructing the boys of the country. The kyoungs are thus converted into national schools. The vows of a pon-gyee include celibacy, poverty, and the renunciation of the world; but from these he may at any time be released, and return to a secular life. Hence, nearly every youth assumes the yellow robe for a time, as a meritorious act, or for the purpose of study, and the ceremony of making a pon-gyee is one of great importance. The ostensible object of the brotherhood is the more perfect observance of the laws of Buddha. The order is composed of five classes—viz., young men who wear the yellow robe and live in the kyoungs, but are not professed members; those on whom the title and character of pon-gyees have been solemnly conferred with the usual ceremonies; the heads or governors of the several communities; provincials, whose jurisdiction extends over their respective provinces; and, lastly, a superior general, or great master, who directs the affairs of the order throughout the empire.

In B., the last Buddha is worshiped under the name of Gautama. His images crowd the temples, and many are of a gigantic size. The days of worship are at the new and full moon, and seven days after each; but the whole time, from the full moon of July, to the full moon of Oct., is devoted by the Burmans to a stricter observance of the ceremonies of their religion. During the latter month, several religious festivals take place, which are so many social gatherings and occasions for grand displays of dress, dancing, music, and feasting. At such times, barges full of gayly-dressed people, the women dancing to the monotonous dissonance of a Burman band, may be seen gliding along the rivers to some shrine of peculiar sanctity. The worship on these occasions has been described by an eye-witness, in 1857, as follows: "Arrived at the shrines and temples, the people suddenly turn from pleasure to devotion. Men bearing ornamental paper-umbrellas, fruits, flowers, and other offerings, crowd the image-houses, present their gifts to the favorite idol, make their *shek-ho*, and say their prayers with all dispatch. Others are gluing more gold-leaf on the face of the image, or saluting him with crackers, the explosion of which in nowise interferes with the serenity of the worshippers. The women for the most part remain outside, kneeling on the sward, just at the entrance of the temple, where a view can be obtained of the image within." On another occasion, we read: "The principal temple being under repair, was much crowded by bamboo scaffolding, and new pillars were being put up, each bearing an inscription with the name of the donor. . . . The umbrellas brought as offerings were so numerous, that one could with difficulty thread a passage through them. Some were pure white, others white and gold, while many boasted all the colors of the rainbow. They were made of paper, beautifully cut into various patterns. There were numerous altars and images, and numberless little Gautamas; but a deep niche or cave, at the far end of which was a fat idol, with a yellow cloth wrapped round him, seemed a place of peculiar sanctity. This recess would have been quite dark, had it not been for the numberless tapers of yellow wax that were burning before the image. The closeness of the place, the smoke from the candles, and the fumes from the quantity of crackers constantly being let off, rendered respiration almost impossible. An old pon-gyee, however, the only one I ever saw in a temple, seemed quite in his element; his shaven bristly head and coarse features looking ugly enough to serve for some favorite idol, and he seemed a fitting embodiment of so senseless and degrading a worship. Offerings of flowers, paper-ornaments, flags, and candles were scattered about in profusion. The beating a bell with a deer's horn, the explosion of crackers, and the rapid mutter-

ing of prayers, made up a din of sounds, the suitable accompaniment of so misdirected a devotion."

The rosary is in general use, and the Pali words *aneitya! doka! anatta!* expressing the transitory nature of all sublunary things, are very often repeated. The Burman is singularly free from fanaticism in the exercise of his religion, and his most sacred temples may be freely entered by the stranger without offense; indeed, the impartial observer will hardly fail to admit that Buddhism, in the absence of a purer creed, possesses considerable influence for good in the country under consideration. The Karens, who used to be nature-worshippers, have many of them embraced Christianity at the teaching of American Baptist missionaries, and now there are over 500 parishes of Christian Karens, containing nearly 200,000 souls; each parish supports its own church, pastor, school, and schoolmaster.

The sacred edifices of the Buddhists are: 1. The *tope*, *dagoba*, or *shrine* (*zadee* or *tsa-dee*), a monument erected to the last Buddha, is a solid, bell-shaped mass of plastered brick-work, tapering to the summit, which is crowned by the *tee*, or umbrella, of open ironwork. 2. The *temple*, in which are many images of Gautama. The most remarkable specimen of Burman temple-architecture is the *ananda* of Pagan. The ground plan takes the form of a perfect Greek cross, and a tapering spire, with a gilded tee at the height of 168 ft. from the foundation, crowns the whole. 3. The *kyoung* or monastery (*vihara*) is generally constructed with a roof of several diminishing stages, and is often elaborately adorned. Burman architecture "differs essentially from that of India in the frequent use of the pointed arch, not only for doors and windows, but also in the vaulted coverings of passages."

Cities.—Mandalay, the capital of upper B., and former seat of royalty, is situated 3 m. from the Irrawaddy, a little to the n. of Amarapura and Ava. It is laid out in three parallelograms, one within another, of which the inner two are walled; the palace occupies the center. Ava and Amarapura, each at one time the capital of the empire, are now almost entirely deserted. Pagan represents the past of B., and is remarkable for its magnificent ruins of temple-architecture, extending over 8 sq.m.; the prevailing type is the cruciform vaulted temple.

Government.—The government of B. was a pure despotism, life and property being at the mercy of the reigning sovereign. The *lot-dau*, or high court of council, was composed of the four *woon-gyees*, or principal ministers of state. The *Dam-a-tha*, a Burman translation of the *Institutes of Manu*, was also in force. White umbrellas and white elephants were regarded as insignia of royalty. The "lord white elephant," indeed, was looked on as an estate of the realm, a mark of sovereignty, and a sacred being.

B. is now governed, in behalf of the viceroy of India, by a chief commissioner, whose headquarters are mainly at Rangoon. The territory is divided into eight provinces, over each of which a commissioner is the supreme judicial and executive officer; and each commissionership is again divided into districts. Each district contains five to ten townships (*myos*), over which presides a Burman magistrate. Beneath the township officer are the circle officers (*thuggies*). Each village has its headman, vested with petty police and revenue powers. The district administration is supported by a strong police force, partly Burmans and partly Indians, commanded by European officers. A military garrison, consisting of about 20,000 troops, occupies the country (1888).

Language.—The vernacular tongue of B. belongs to the monosyllabic class of languages, is without inflection, and is written from left to right. Letters are formed of circles and segments of circles, and are perhaps the modification of Sanskrit characters. The grammar is simple, but the language is difficult to acquire on account of its peculiar pronunciation. Burmese has been a written language for perhaps 800 years, and the Shan language (akin to Burmese) has also been long written. Karen has been reduced to writing by the American missionaries. The classical and religious language is Pali, the older literature of the country consisting of Pali works on law and religion. There are books on history, but they are not trustworthy. The favorite literature consists of dramas and poetical fables. Printed books are now sold in nearly every market in Lower B., and several vernacular newspapers are published. A grammar and dictionary have been published by A. Judson in 1866 and 1877 respectively.

Education.—The primary schools are the Buddhist monasteries, in which every boy must spend a part of his life and learn to read and write. Girls are often taught with the boys in lay schools, and schools for girls alone have been established. In general, in the treatment of women B. compares very favorably with other Oriental countries.

Trade, etc.—The external seaborne trade of lower B. is valued at fourteen millions sterling. The chief export items are rice, teak timber, cutch, hides, cotton; the chief import items are cotton piece-goods and yarns, silk goods, coal, hardware, salt, and metals. The great staple of Lower B. is rice, of which as much as 1,150,000 tons are exported in one year. Since B. came under British rule, many m. of metaled and bridged roads have been made; three navigable canals have been dug; three railways have been opened, one connecting Mandalay with the seaboard; embankments have been erected along the Irrawaddy, and hospitals, court-houses, and churches in many places. The Irrawaddy flotilla company have placed on the Irrawaddy a fleet of large steamers and flats, and the peace of the country is safeguarded by forts at Rangoon, Thayetmyo, Mandalay, etc., as well as by batteries at the ports of Rangoon and Moulmein.

Railways.—The extent of railway lines has greatly increased in recent years. In Dec., 1895, work was begun on the Mandalay-Salween line. The country has been surveyed by British engineers, and in July, 1896, the Rothschilds announced the formation of the Burmah Railways Company, with a capital of £2,000,000. This company acquired

several lines already open to traffic, among them the line from Rangoon to Prome (161 miles), from Rangoon to Tounghoo (166), and from Tounghoo to Mandalay (220). In all, the state railway system acquired by the syndicate had 1,000 miles open to traffic. Several important lines are in process of construction. The government guarantees an interest of $2\frac{1}{2}$ per cent., and participation in the surplus profits.

Arts and Manufactures.—The native artisans display great skill and taste in wood-carving, lacquer ware, made on delicately woven bamboo frames, silver repoussé work, and woven silk fabrics. They also make serviceable and picturesque boats, forming the lower part of the hull from the trunk of the thingan-tree. The prow and the stern, which are raised several feet above the deck, are often beautifully or grotesquely ornamented.

Architecture.—The people live in wooden houses or bamboo huts, which are built on posts or piles, and are sometimes twelve feet from the ground. This is true of the upland as well as of the marshy districts. In the cities a few houses of masonry are to be seen. The well-to-do build their houses of teak or other wood planks, the high pitched roofs and projecting eaves presenting a very picturesque appearance. Devout Burmans erect monasteries and rest-houses in the cities and villages, expecting to obtain in return reward in the future life. The large cities contain beautiful pagodas and monasteries, and Mandalay is famed for its monasteries. The most sacred pagoda is at Rangoon.

Finances, etc.—The total public revenue for the year ending March 31, 1895, was 5,575,323 rupees.

History.—Of the early and mythical history of B., nothing need here be said. The kingdoms of Ava and Pegu long contended for mastery. The latter was in its zenith in about 1580 A.D. Passing on to 1752, it appears the Peguans, after a period of subjection, obtained the advantage. At this time, however, Alompra, or *Aloung-Pra*, the most celebrated warrior-king in Burman history, rose to power, founded the present dynasty, subdued the Peguans, and incorporated their country, as well as many neighboring states with his own. During the later part of the 18th century Siam revolted, and B. suffered three invasions by Chinese armies from the n. Early in the 19th century the Burmese conquered Assam, and about 1820 came into contact with the British power in India, making incursions into British territory, attacking British subjects and troops, and refusing demands for redress. War ensued, 1824–26, ending in the cession by Ava of the provinces of Arakan and Tenasserim. After 1830 war broke out again, and ended in the acquisition of Pegu by the British. From 1880–85 the Mandalay government intrigued with another European power, and infringed the existing treaty. King Thebaw's repeated attacks on the interests of British subjects led to an ultimatum from the Indian viceroy. On Thebaw's refusal to treat, and the publication of a proclamation calling all Burmans to rise against the English, a British force invaded his kingdom, captured Mandalay and carried Thebaw off captive to India. Early in 1886 the whole of upper B. was incorporated with the queen's Indian dominions. On January 15, 1896, an agreement was concluded between France and Great Britain making the Mekong river the boundary between the Shan States and Indo-China. This arrangement gave up to France a part of the territory on the eastern side of the Upper Mekong, which was formerly tributary to B. In the same year a plan for the formation of a local legislative council for B. was under discussion. In 1891, the population was 7,605,560, of whom 4,658,627 were in Upper B. See Yule's *Narrative of the Mission in 1855*; Fytche's *Burma Past and Present* (1878); Winter's *Six Months in B.* (1858); Capt. Bower's *Bhamo Expedition* (1869); Vincent's *Land of the White Elephant* (1874); Colquhoun's *Across Chryse* (1883). For types of people, see illus., *ETHNOLOGY*, vol. V.

BURMANN, PETER, the most important member of a Dutch family celebrated for learning, was b. at Utrecht 1668, studied law at the university of that city and of Leyden, and, after taking his degree in 1688, traveled through Germany and Switzerland. After practicing as an advocate for some years, he was appointed professor of history and rhetoric in the university of Utrecht; which office he subsequently exchanged for the professorship of Greek. In 1715, after the death of Perizonius, he removed to the university of Leyden, where he died 31 Mar., 1741.

His literary career was very active, and his hot temper and intolerant spirit involved him in many controversies. Among his most distinguished adversaries were Le Clerc and Bentley. His chief works are editions of the Latin classics—Petronius, Velleius Paterculus, Quintilian, Valerius Flaccus, Phædrus, Ovid, the *Poëtæ Minores*, Suetonius, Lucan. The first of these appeared in 1709, and the last in 1740. They are characterized less by taste and critical acumen than by learning, fullness, and beauty of type.

BUR-MARIGOLD (*Bidens*), a widely distributed genus of composite annuals and perennials, including in America the weeds called "beggar-ticks." Some species have very showy flowers.

BURMEISTER, HERMANN, b. 1807; a Prussian naturalist, studied medicine and natural history, and in 1842 was appointed professor of zoology in the university of Halle. In 1848 he was a deputy to the Frankfort assembly, and afterwards a representative in the first Prussian chamber. In 1850, he made a survey in Brazil in the interest of science, and visited other parts of South America a few years later. He published many elaborate works on natural history, travels, etc. He d. in 1892.

BURMESE WARE, small cups, etc., made of strips of bamboo woven like fine basket work, the interstices being filled with paste made of wood-ool and fine powders, and when sufficiently hardened the surface smoothed with pumice-stone and water.

BURN, RICHARD, was b. in 1720 at the village of Winton, in Westmoreland. After being educated at Queen's college, Oxford, he received the living of Orton, in his native county, which he continued to hold until his death in 1785. He is widely known as the compiler of two very useful law-books, the *Justice of the Peace* and *Ecclesiastical Law*, which have each passed through many editions. He also published a *History of the Poor Laws*, an edition of Blackstone's *Commentaries*, and several sermons and works of a religious nature.

BURN, WILLIAM, Scottish architect, 1789-1870; was born in Edinburgh, and trained under Smirke; founded a successful business in Edinburgh, and removed to London (1844), where he was equally popular and well employed, and where he died. His "restoration" of St. Giles' church (1829-33), in Edinburgh, was singularly devoid of taste or reverence, and has been as far as possible undone.

BURNABY, FREDERICK GUSTAVUS, 1842-85; b. Bedford, Eng.; educated at Harrow and in Germany. Early in life he displayed his fondness for hardships and adventure. He entered the royal horse guards in 1859; traveled extensively; and in 1875, undertook his famous ride to Khiva. In this exploit, unaided and alone, he made his way to the heart of Asia, notwithstanding the oriental laws forbidding the passage of foreigners into certain districts, and the traps laid by the Russians to waylay him. In 1876-77, he rode on horseback through Asia Minor, and from Scutari to Khiva, in Persia. He was military correspondent of the *Times*, with Don Carlos in Spain; and in 1880, contested Birmingham for parliament as a conservative, receiving 15,716 votes, although Joseph Chamberlain and John Bright were the opposing candidates. He took part in the Egyptian campaigns, and was killed in an engagement with El Mahdi's troops, Jan., 1885. His death was widely lamented in England. An interesting account of B.'s travels is in his two books, *A Ride to Khiva*, and *On Horseback through Asia Minor*.

BURNAND, FRANCIS COWLEY, b. 1837; educated at Eton and Cambridge, and called to the bar in 1862. His success as a writer of burlesques led him to adopt literature as a profession. He has produced nearly a hundred dramatic pieces, among which *Lion*, and the travesty of Jerrold's *Black-Eyed Susan*, had remarkable runs. He became one of the leading contributors to *Punch*, and in 1880 succeeded Tom Taylor as its editor. From the pages of that periodical he has collected a number of volumes, among which the best known are *Happy Thoughts* (1870), *More Happy Thoughts* (1871), *Happy Thought Hall* (1872), *Quite at Home* (1890).

BURNAP, GEORGE WASHINGTON, D.D., 1802-1859; a graduate of Harvard, and pastor of the First Independent church of Baltimore from 1828 until his death. He was the author of many volumes on religious themes, lectures, a life of Calvert, governor of Maryland, an exposition of his particular school of Unitarianism (1855), etc.

BURNE-JONES, Sir EDWARD, A.R.A., English artist, was b. at Birmingham, of Welsh descent, Aug. 28, 1833. He was educated at King Edward's grammar school, and at Exeter college, Oxford, which he entered in 1853, and was destined for the church, but having decided to adopt art as a profession, left the university without taking any degree. He however received the honorary degree of D.C.L. from Oxford in 1881, and was given an honorary fellowship by Exeter college. In 1856 he went to London to begin his art study, but instead of entering an academy taught himself, receiving much help from Rossetti, and allied himself with the romantic school (see PRE-RAPHAELITES), in which his friend was prominent. Among his early works may be mentioned the triptych in oil-color, of the "Annunciation and Nativity," in St. Paul's, Brighton, 1861; "The Merciful Knight," 1864; "The Wine of Circe," 1867; and "Love among the Ruins," 1873, all three in water (body) color. After 1870, his principal pictures were executed in oils, and among them are "Laus Veneris," 1873-75; "The Beguiling of Merlin," 1877; "Le Chant d'Amour," 1878; "The Golden Stairs," 1880; "King Cophetua," 1884; "The Depths of the Sea," 1886; "The Brazen Tower," 1888; "The Legend of the Briar Rose," 1890. In 1885 he was elected an associate of the Royal Academy of Arts; and in 1887 he aided in establishing the New Gallery of Art. The work of Burne-Jones includes some fine designs for stained glass, such as those for the St. Cecilia window of Christ church, Oxford; and the mosaic in the apse of the American church at Rome was designed by him. His early paintings, though often deficient in draughtsmanship, were very brilliant in color; his later pictures, though no less poetical, show a greater knowledge of the human figure, but are lower in tone. He was made a baronet in 1895.

BURNES, Sir ALEXANDER, a distinguished traveler in Central Asia, was b. at Montrose, in Scotland, 1805, where his father, who was a cousin of Robert Burns the poet, was an active magistrate. He early entered the Indian army, and his knowledge of oriental languages gained him rapid promotion. After performing some important missions for the Indian government, he was, at his own suggestion, sent on an expedition into Central Asia. Starting from Lahore on the 11th Feb., 1832, B., having adopted the dress and usage of the Afghans for greater safety, passed through Peshawur and Cabul, and, crossing the Indian Caucasus, reached Balkh on the 9th June. Thence he passed on to Bokhara, Astrabad, and Teheran, and journeying through Ispahan and Shiraz, reached Bushire on the Persian gulf, from whence he embarked for India. He received the special thanks of the governor-general for his travels; and on his return to England in 1833, he received a warm welcome from the India house and board of con-

trol. and was highly honored by the Royal Geographical and other societies. In Sept., 1839, having previously, for his important services, been knighted and promoted to the rank of lieut. col., he was appointed political resident at Cabul, where he was murdered on the breaking out of the insurrection in that city in Nov., 1841—a tragedy re-enacted in 1879, when sir Louis Cavagnari, newly appointed resident in Cabul, was massacred, with his staff and guards. B. was author of *Travels into Bokhara* and a work on *Cabul*.

BURNET, the English name of two genera of plants, *sanguisorba* and *poterium*, belonging to the natural order *sanguisorbeæ* (q.v.)—very generally regarded as a suborder of *rosacea*—which have much resemblance to one another, and receive a common name also in other languages. *Sanguisorba* has hermaphrodite flowers with four stamens; in *poterium*, the flowers are polygamous, and the stamens indefinite in number. In both, the calyx is 4-fid, and the corolla wanting. **GREAT B.** (*sanguisorba officinalis*) is common in meadows in all parts of Europe, and not unfrequent in some parts of England, particularly where the soil is calcareous. It has a stem 1 to 2 ft. high, pinnate leaves, with about four pair of ovate serrated leaflets and an odd one; the flowers are crowded in dark red spikes. It is cultivated in Germany for feeding cattle, and is much esteemed for this use, as it grows well even on very poor soils, and the produce is abundant. Cattle are very fond of it. The root is astringent, and was formerly used in medicine. **COMMON B.** (*poterium sanguisorba*) grows in sunny places on hills in the middle and south of Europe, and is common in England, especially in the chalk districts. In habit and foliage, it much resembles the Great B., but the leaflets are smaller and the flowers are in heads of a dull purplish color. It has been much cultivated in some parts of England as a substitute for clover on chalky soils, and is relished by cattle. It forms great part of the natural pasture of the South Downs, and of the excellent sheep-walks of Salisbury plain. It is regarded as a plant particularly suitable for poor arid soils. It is sometimes cultivated in gardens, and its leaves, which are slightly astringent, are used in salads or soups. They are said to form one of the ingredients of the famous *cool tankard*, and the name *poterium* is from Greek word signifying a drinking vessel.—Both this and the preceding are perennial plants.—There are several other species both of *sanguisorba* and *poterium*, some of the latter shrubby, natives chiefly of the warmer temperate parts of the world. *P. Canadense* is found in the north-eastern U. S.

BURNET, a co. in central Texas, on the Colorado river; 1000 sq. m.; pop. '70, 3688—358 colored; in '90, 10,721. The surface is hilly and rocky, with fertile soil. Marble of various colors, limestone, coal, iron, and petroleum are found. Agriculture is the main business. Co. seat, Burnet.

BURNET, GILBERT, bishop of Salisbury, was b. at Edinburgh, on the 18th Sept., 1643. He was educated at home, and afterwards at Marischal college, Aberdeen, where he pursued his studies so diligently, that he took his degree of M.A. before he was 14. In the course of a year he made up his mind to enter the church, and read so hard at theology, that in less than three years he had mastered the chief systems of divinity, besides having gone over the Old and New Testaments in the original, with all the commentaries of note in his time. In 1663, he visited Cambridge, Oxford, and London, where he met with many of the leading divines of England. Next year, he passed over into Holland and perfected his knowledge of Hebrew under a learned rabbin of Amsterdam. In 1665, he was presented to the parish of Saltoun, where he remained five years. In 1669, he was appointed professor of divinity in the university of Glasgow, but having mixed himself up in the politico-ecclesiastical affairs of the time, he brought upon himself the enmity of Lauderdale, and found it prudent to resign his chair in 1674. He now removed to London, and was made preacher at the Rolls' Chapel by sir Harbottle Grimston, and afterwards lecturer at St. Clement's. In 1676, he published his *Memoirs of the Dukes of Hamilton*, and in 1679, the first volume of his *History of the Reformation*, which procured him a vote of thanks from both houses of parliament. Next year appeared *Some Passages in the Life and Death of the Earl of Rochester*, in which B. records the religious interviews which he had with that profligate nobleman during his last illness, and which led to the latter's conviction of the truth of Christianity. In 1681, he published the second volume of his *History of the Reformation*, and in 1682 his *Life of Sir Matthew Hale*. The efforts which had previously been made, were now repeated, to induce him to break with the liberal and moderate party, and to attach himself to the king. He was offered the bishopric of Chichester, but refused it. In 1683 he narrowly escaped being brought into trouble in regard to the Ryehouse plot. He conducted the defense, attended the execution, and vindicated the memory of his friend lord William Russell. The king exhibited his unkindly spite by depriving B. of his St. Clement's lectureship. On the accession of James II., he went to the continent, and traveled through France, Italy, Switzerland, and Germany. In 1684, he was introduced to the prince of Orange, with whom he became a great favorite, and by whom he was frequently consulted in reference to the great scheme for the deliverance of England. When William came over, B. accompanied him in the capacity of royal chaplain, and shortly after, was appointed bishop of Salisbury. He entered on the duties of his diocese with great ardor; but his first pastoral letter, in which he founded the right of William to the throne on conquest, gave so much offense to both houses of parliament, that they ordered it to be burned by the hands of the common hangman. William, however, who

knew the excellent qualities of the bishop, was not greatly impressed by this solemn performance, and continued to trust B. to the end of his life. In 1698, B. was appointed preceptor to the duke of Gloucester; in 1699, he published his celebrated exposition of the 39 articles, which was condemned as heterodox by that not very competent assembly, the house of lords. In 1714, appeared the third volume of his *History of the Reformation*. In the spring of 1715, he was attacked by a pleuritic fever, and carried off on the 17th of Mar., in the 72d year of his age. B. was thrice married; his first wife was remarkable for her beauty; the second, for her fortune; and the third, for her piety.

Soon after B.'s death, appeared *Bishop B.'s History of his Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht, in the Reign of Queen Anne*. It was sarcastically but foolishly abused by the tory writers of the day—Swift, Pope, Arbuthnot, and others. B. was a man of strict, almost of puritanic virtue; yet his charity, geniality, and moderation of sentiment might be imitated with advantage even in our own day. His style is neither elegant nor correct, and his judgment is not always reliable, yet the honesty, earnestness, simplicity, and vigor of his writings, as well as their fullness of details, make his works very valuable to the student of history.

BURNET, JACOB, LL.D., 1770–1853; a graduate of Princeton, and one of the early settlers of Cincinnati; judge of the Ohio supreme court in 1821, and U. S. senator in 1828. He published *Notes on the Early Settlement of the North-west Territory*.

BURNET, JOHN, a painter, engraver, and author, was b. at Fisherrow, near Edinburgh, Mar., 1784. He was first brought under the notice of the public through his engravings of Wilkie's works, which he executed in a most admirable manner. Of his own paintings, the best known engraving is that of "Greenwich Pensioners receiving News of the Battle of Trafalgar." He has written several works on art, illustrated by drawings and engravings of his own, the most important of which is a *Practical Treatise on Painting*. He is also the author of *Rembrandt and his Works*, 4to, 1849; and in conjunction with Mr. Peter Cunningham, of *Life and Works of J. M. W. Turner*, 1852. He died in 1868.

BURNET, THOMAS, best known from his *Theory of the Earth*, was b. in Yorkshire, 1635, and studied at Cambridge. After acting as traveling tutor to several noblemen, he was elected master of the charter-house (1685), and later, succeeded archbishop Tillotson as clerk of the closet to William III. But having (1692) published a work, *Archæologia Philosophica, sive Doctrina Antiqua de Rerum Originibus* (also in English), displaying great learning, but treating the Mosaic account of the fall as an allegory, he was obliged to retire from the clerkship, and lived in the charter-house till his death, in 1715. His *Telluris Theoria Sacra* (first part, 1680; second, 1689) was written in Latin, but translated, or rather recomposed in English, by the author. It is an ingenious speculation, written in ignorance of the facts of the earth's structure, and is therefore a mere system of *cosmogony*, and not geology. But it abounds in sublime and poetical conceptions and descriptions, conveyed in language of extraordinary eloquence.

BURNETT, FRANCES ELIZA HODGSON, b. Manchester, Eng., 1849, Nov. 24. When she was fifteen years old her parents emigrated to the U. S., and settled in Knoxville, Tenn. At an early age she began her contributions to periodicals, but the short story of *Surly Tim's Troubles*, which appeared in *Scribner's Magazine*, 1872, was the first work from her pen giving evidence of her remarkable abilities. The good impression made by this and succeeding stories and sketches was increased by the powerful novel, *That Lass o' Lowrie's*, which, after running as a serial through *Scribner's Magazine*, was published in book form, 1876. The story was dramatized both in America and in England. She has since published, *Haworth's*, 1878; *Louisiana*, 1880; *A Fair Barbarian*, 1881; *Through One Administration*, 1882; *Piccolo and other Child Stories*, 1894; *Two Little Pilgrims' Progress*, 1895; *A Lady of Quality*, 1896, etc. In conjunction with W. H. Gillette she produced a play *Esmeralda*, 1881, founded on one of her short stories. In 1873 she married Dr. S. M. Burnett and became a resident of Washington, D. C. *Little Lord Fauntleroy*, 1886, a child's story, was dramatized in 1888, and had long runs on the stage.

BURNETT, WALDO IRVING, 1828–54; a naturalist and microscopist; b. Mass. He did a great amount of microscopical work within the five years preceding his death. His chief publication was a prize essay on *The Cell, its Physiology, Pathology, and Philosophy*, deduced from Original Observations; to which is added its History and Criticism.

BURNETT PRIZES, THE, two theological premiums, founded by Mr. Burnett of Dens, Aberdeenshire. This gentleman (b. 1729—d. 1784) was a general merchant in Aberdeen, and for many years during his lifetime spent £300 annually on the poor. On his death, he bequeathed the fortune he had made to found the above prizes, as well as for the establishment of funds to relieve poor persons and pauper lunatics, and to support a jail chaplain, in Aberdeen. He directed the prize fund to be accumulated for 40 years at a time, and the prizes (not less than £1200 and £400) to be awarded to the authors of the two best treatises on "The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind." Prizes were awarded in 1815 and in 1855, and the essays were published. The fund was afterwards applied to the foundation of a lectureship.

BURNETT'S DISINFECTING LIQUID AND ANTISEPTIC FLUID is a liquid introduced by sir W. Burnett for the purpose of deodorizing the bilge-water of ships, sewerage-water, etc. It is a strong solution (sp. gr. 2) of chloride of zinc, accompanied by a small amount of chloride of iron; and when intended to be used, it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a *deodorizer* and *antiseptic* (see **ANTISEPTICS**), and does not yield any vapor which can exhibit the properties of a disinfectant (q.v.). It is of service in preserving dead animal tissues, as in the dissecting-room, and in jars containing anatomical specimens. It has little action on knives or steel instruments. When added to bilge or sewerage water, the chloride of zinc, $ZnCl$, mainly acts by decomposing the offensive sulphide of ammonium, NH_4S , which it does by forming the sulphide of zinc, ZnS , and chloride of ammonium, NH_4Cl , both of which are odorless. The strong solution of chloride of zinc has also been applied to the preservation of timber, and the process of so treating wood is called, after its inventor, *Burnettizing*. *Crewe's* disinfectant liquid is chemically the same as the above.

BURNEY, Dr. CHARLES, a musical composer, celebrated as the author of the *General History of Music*, was b. at Shrewsbury, 1726. Having studied music in his native city, in Chester, and under Dr. Arne in London, he commenced giving lessons in music himself. After composing three pieces—*Robin Hood*, *Alfred*, and *Queen Mab*—for Drury Lane, B. London, and settled at Lynn, in Norfolk, where he designed his work on the *History of Music*. In 1770-72, he traveled in France, Italy, the Netherlands, and Germany, collecting materials for his proposed work, and published an essay on the *Present State of Music in France and Italy*, etc. (2 vols., Lond. 1772). This was followed by his *General History of Music from the Earliest Ages to the Present Period* (4 vols., Lond. 1776-89.) Besides other minor works, B. wrote a *Life of Handel*, and nearly all the musical articles in *Rees's Cyclopædia*. He was appointed organist to the hospital at Chelsea in 1789. He died in 1814. He was intimately acquainted with many of the most eminent men of the day, including Edmund Burke and Dr. Johnston.—His second daughter, FRANCES B. (afterwards Madame D'Arblay) (q.v.), was distinguished as an authoress.

BURNHAM BEECHES, the remains of an ancient forest in Buckinghamshire, England, twenty-five miles northeast of London, noted for its immense beech-trees. The poet Gray, early in the eighteenth century, called attention in his letters to this wild and picturesque tract. In 1879 the London corporation purchased the surrounding 374 acres, and in 1883 set them apart for public use. See Heath, *Burnham Beeches* (1880).

BURNING GLASSES AND MIRRORS. See HEAT, LENS, and MIRROR.

BURNLEY, a thriving t. and parliamentary borough in Lancashire, situated in a narrow vale on the banks of the Brun, a mile and a half above its junction with the North Calder, and 24 m. n. of Manchester. Pop. of parliamentary borough, est. '96, 102,805. It has factories for the weaving, spinning and printing of cotton, and for the manufacture of weaving machinery. There are collieries in the vicinity, and traffic is facilitated by railways and canals, which unite it with the principal centers of trade in Lancashire and Yorkshire. B. returns one member to parliament.

BURNOUF, EMILE LOUIS, orientalist, and cousin of Eugène, mentioned below, was born at Valognes, France, Aug. 25, 1821. He lectured for a time at Nancy, on ancient literature, and subsequently was director of the French school at Athens. Among his works are *Méthode pour étudier la Langue Sanscrit* (3d ed., 1885); *Essai sur le Veda* (1863); *Dictionnaire Classique Sanscrit-Français* (1863-65); *Histoire de la Littérature Grecque* (1869); *La Ville et l'Acropole d'Athènes aux diverses Époques* (1877); *La Mythologie des Japonais* (1878); and *Le Catholicisme Contemporain* (1879).

BURNOUF, EUGÈNE, one of the most distinguished orientlists of modern times, was b. at Paris, April 1, 1801, and after entering on the study of law, betook himself to the oriental languages, especially those of India and Persia. In conjunction with prof. Lassen of Bonn, he published, in 1826, *Essai sur le Pali*, which was followed, in 1827, by *Observations Grammaticales sur quelques Passages de l'Essai sur le Pali*. His great aim, however, at this time, was to obtain a complete knowledge of the remains of the religious literature in the Zend, or old Persic language, which had been neglected since the time of Anquetil du Perron, or, at least, not philologically and critically examined. B. undertook to decipher those curious MSS. which Anquetil du Perron had brought home with him, and which lay unregarded in the *Bibliothèque Impériale*. He commenced by causing the *chef-d'œuvre* of old Persic literature, the *Vendidad-Sadé* (one of the books of Zoroaster), to be lithographed with great care, and published from time to time in the *Journal Asiatique* the brilliant results of his laborious studies, which drew upon him the regard of the learned world. In 1834, he published the first volume of his *Commentaires sur le Yaçna, l'un des Livres Liturgiques des Perses*, a work which, for the first time, rendered possible a knowledge not only of the dogmas, but also of the language of Zoroaster. It is a masterpiece of conscientious industry, united with copious lingual and antiquarian lore. His studies in the Zend language induced him to make an attempt to decipher the cuneiform inscriptions of Persepolis, in his *Mémoire sur deux Inscriptions Cunéiformes* (Par. 1836). In 1840, he published the text along with a translation of the *Bhāgavat-Purāna*, a system of Indian mythology and tradition. As the fruit of his study of the Sanscrit books of the Buddhists, appeared in 1845 the *Introduction à l'Histoire du Bouddhisme*. See **BUDDHISM**.

This great work absorbed for six years the whole energies of B., who was now the recognized successor of Silvestre de Sacy. It is to be regretted that death did not permit him to continue his labors further. He died May 28, 1852.

BURNOUF, JEAN LOUIS, 1775-1844; French philologist and father of Eugène, was born at Urville; became professor of rhetoric at the College de France in 1817, and subsequently was inspector of the university, general director of studies, and librarian. In 1836 he was elected a director of the Académie des Inscriptions. He was the author of Greek and Latin grammars, and of an excellent translation of Tacitus.

BURNS, FRANCIS, D.D., 1809-63; b. in New York; a colored preacher who became a bishop of the Methodist Episcopal church. In 1834 he was a missionary in Liberia, where, in 1851, he founded the Monrovia academy, and in 1858 became bishop.

BURNS, REV. JABEZ, D.D., a Baptist minister, and one of the most prolific religious writers of the 19th c., was b. at Oldham, near Manchester, in 1805, and was educated at Chester, and afterwards at Oldham grammar-school. After helping his father as a medical practitioner, and acting as assistant in a drapery establishment, he joined the Methodist New Connection, and removed at the age of 21 to London. In 1828 and 1829, he published his first two works, *The Christian Sketch-book* and *The Spiritual Cabinet*, which gained him much popularity among the religious public. After preaching at Perth, Scotland (1830-35), he returned to London to become minister of a general Baptist congregation in Marylebone. He lectured throughout the United Kingdom on temperance, peace, and other subjects; visited the United States in 1846 and 1872, and received degrees from colleges there. Of his numerous works, *Sketches and Skeletons of Sermons* (15 vols.), and *The Pulpit Cyclopædia* (4 vols., 1846-60), are the most important. He died in 1876.

BURNS, JAMES DRUMMOND, a poet, was born in Edinburgh in 1823. He studied at the University of Edinburgh, from which he graduated in 1841, and entered the Free Church College, where he studied theology. In 1845 he entered the Presbyterian ministry. His best-known work is *The Vision of Prophecy* (1854). He also published two volumes of minor verse, including several good hymns. He died at Mentone in 1864.

BURNS, JOHN, M.D., a well-known Scotch surgeon, was born in Glasgow in 1775. In 1815 he was called to the chair of surgery in Glasgow University, which he filled for many years. His most important work is the *Principles of Midwifery* (10th ed., 1843), besides which he also published *Principles of Surgery* (1838), and *Principles of Christian Philosophy* (6th ed., 1846). He died in a shipwreck in 1850.

BURNS, ROBERT, the great lyric poet of Scotland, was b. 25th Jan., 1759, in a small cottage near Ayr. His father, then a nursery-gardener, and afterwards the occupant of a small farm, had to struggle all his life with poverty and misfortune, but made every exertion to give his children a good education; and the young poet enjoyed an amount of instruction and miscellaneous reading which, to those unacquainted with the habits of the Scottish peasantry, would seem incompatible with the straitened circumstances and early toil which were his lot. About his 16th year, he began composing verses in the Scottish dialect, which attracted notice in the vicinity, and extended the circle of his acquaintance; and thus he became exposed to temptations which, acting on an extremely sociable and passionate disposition, broke in upon the previous sobriety and correctness of his life. A small farm, on which he had entered with his brother in 1781, proved far from a prosperous undertaking; and being harassed and imbibed by other misfortunes—the results of imprudence—he resolved to leave his native land, and go to Jamaica. Partly to procure the means of paying his passage, he published a collection of his poems at Kilmarnock in 1786. The reception these met with was highly favorable, and his genius was recognized in quarters where he had not looked for notice. While preparing to embark, he received a letter encouraging him to go to Edinburgh, and issue a new edition. This was the turning-point of his life. During his stay in the Scottish metropolis, he associated with all that was eminent in letters, rank, and fashion, and his conversational powers excited little less admiration than his poetry. The profits of the publication were considerable, and enabled him to take the farm of Ellisland, near Dumfries, where he settled in 1788, having publicly ratified his marriage with Jean Armour. With his farm he conjoined the office of an exciseman; but after 3 or 4 years, he was obliged to give up farming, and from that time lived in Dumfries, dependent on his salary from the excise, which, at first, only £50, never rose above £70. The striking contrasts in the lot of the rich and the poor with which his residence in Edinburgh had impressed him, made him hail the French revolution with enthusiasm; and some imprudent expressions of his having been reported to the authorities, destroyed his prospects of promotion in the service, and only the interference of an influential friend prevented him from losing his office. Such was then the terror of innovation, and the hatred of everything like liberal opinions, that many of the better classes, who had fêted the poet, now shunned the "Jacobin," as they stigmatized him. Imbittered by what he felt to be injustice, he recklessly allowed those habits of dissipation to grow upon him which made the more respectable of all classes look coldly on him; and the remorse thus occasioned in his calmer moments aggravated that tendency to melancholy which the gloom and toil of his early years had probably implanted in his constitution. Broken in health, he died 21st July, 1796.

The poetry of B. is purely the outpouring of the moment—the response of the feelings to the immediate circumstances of life. Its charm and power lie in the justness of the feelings expressed, and in the truthfulness and freshness which it derives direct from life. Seldom have such manliness, tenderness, and passion been united as in the songs of Burns. They formed the first awakening of the spirit of true poetry in Britain after a long slumber. The popularity that B. instantly acquired has continued unabated, not only in his native Scotland, but wherever English is spoken; his poems have also been translated into almost every European tongue. Dr. Currie, of Liverpool, published the first collected edition of his poems and letters, with a life (4 vols., Lond., 1800). Several more complete collections have appeared since, such as that by Allan Cunningham (8 vols., Lond., 1834), and that by Mr. Scott Douglas, and Prof. Nichol (7 vols., Edin., 1877-82). A life of B., by Lockhart, appeared, Edin., 1828. In *The Life and Works of Burns* (Edin., 1851-52, revised ed. 1896), by R. Chambers, the poems are incorporated in the narrative in chronological order. See also the Life, by Principal Shairp, in *English Men of Letters: Letters to Clarinda* (1802; 1843); the essay by Carlyle and that by R. Louis Stevenson (*Men and Books*). The best portrait is Nasmyth's (1787).

In 1859, the centenary of B.'s birth was celebrated with great enthusiasm, not only in Scotland, but throughout the English-speaking world; and in 1896 the centenary of his death was celebrated by public meetings in Glasgow and Dumfries.

BURNSIDE, AMBROSE EVERETT, b. Ind., 1824; a graduate of West Point, serving in the army until 1853, when he resigned and established in Rhode Island a factory for making a breech-loading rifle of his own invention. In the civil war he served as colonel, and brig. and maj. gen. of volunteers, and was in many important engagements. He resigned at the close of the war, and in 1866 was chosen governor of Rhode Island; was re-elected twice afterwards; in 1875 became U. S. senator. He d. 1881.

BURNS and SCALDS are injuries to the surface of the living body arising from excessive heat—a scald implying that the heat proceeded from a fluid medium, as boiling water; a burn, from a solid. The injury is much the same in both cases; therefore the directions for the treatment of burns will be applicable also to scalds. These injuries may be divided into three classes: 1. Burns resulting in simple redness of the skin; 2. Burns resulting in vesication or blistering; 3. Burns resulting in sloughing, or death of the part. The first object, after the accident has occurred, is to relieve the suffering; and cold applied either in the form of ice or water seems in most cases to have almost a specific power in allaying pain and checking the advance of inflammation. In other cases, moderate warmth is found more efficacious, and we must be guided mainly by the sensations of the sufferer as to which of these remedies we make use of. In very severe cases, opium or chloroform may be employed. But if the injury the body has received be very serious, the patient complains less of pain than of cold; he shivers, is much depressed, and must be well supplied with stimulants, to prevent his dying from the shock.

The best local application is Pond's extract, which derives its name from the well-known plant *hamamelis Virginica*, better known as witch hazel (q.v.). Blisters may be pricked, and the contained serum allowed to trickle away, but on no account is the raised skin to be removed. The dressings should not be changed oftener than cleanliness requires; and as each portion of the old dressing is removed, it must at once be replaced with fresh, so that as little exposure as possible of the burnt surface may take place. The main principle of treatment is exclusion of the air from the injured part; and so long as this is effected, it matters but little what remedial agent is employed. Great care must be taken in the treatment of a sore resulting from a burn, that the contraction of the scar does not cause distortion of the neighboring parts.

When the clothes catch fire, the person should lie down on the floor, and roll herself, or be rolled, in the rug, table-cover, or anything sufficiently voluminous to stifle the flames; and afterwards the clothes, especially stockings, should be removed with great care, lest the cuticle should separate with them, which would materially increase the sufferings of the patient.

Extensive scalds or burns are very fatal to young children; and it must be remembered that their skin is more susceptible to external impressions, and will suffer from a degree of heat innocuous to an adult. Infants have frequently been scalded to death in too hot baths, or by too hot fomentations. The principles of treatment for burns produced by the contact of chemical agents to the skin, are the same as those for burns by fire.

BURNTISLAND, a seaport t. of Fifeshire, on the n. shore of the firth of Forth, about 8 m. n.n.w. of Edinburgh. It consists of one long street, clean and well kept, with a back street running parallel, and some diverging lanes. B. is an important station of the North British railway, having a steamboat ferry connecting it with Granton, the station on the opposite side of the Forth. It has a commodious harbor, which was greatly improved in 1876, and dock. Its trade consists principally of distilling, oil-refining, and the shipping of coal and iron; and in summer it is considerably resorted to as a convenient watering-place. It unites with Kinghorn, Dysart, and Kirkcaldy to send one member to parliament. Pop. '91, 4692.

BURNT OFFERING. See SACRIFICE.

BURNT SIENNA, a fine orange-red pigment, transparent and permanent, used both in oil and water-color painting. It is obtained by simply burning the ferruginous

ochreous earth known as Terra di Sienna. Excellent greens are produced by mixing it with Prussian blue. It mixes well with other pigments generally, and dries quickly.

BURNT STONES, antique carnelians found in ruins, and seeming to have been acted upon by fire, having a dull appearance externally, but exhibiting a beautiful red color when held up to the light. They are sold at a very high price, particularly if to the natural beauty of the stone is added the merit of fine workmanship. They were once, however, more esteemed than now, and an imitation of them, by burning the upper surface of carnelians with a hot iron, was very fashionable.

BURNT UMBER, a pigment of a russet-brown color, is semi-transparent, mixes well with other pigments, and dries quickly. It is obtained by burning umber, an ochreous earth containing manganese, and deriving its name from the place where it was first discovered—Umbria, in Italy.

BUR OAK, or **BURR OAK**, *Quercus macrocarpa* (Michx.), a valuable tree for timber, found in the Atlantic and Western States; sometimes called the mossy-cup oak.

BUROW, JULIE, German novelist, 1806-68, the author of many popular stories. She described the life of a small town with great vividness and accuracy. Among her novels are *Ein Arzt in einer kleinen Stadt*, and *Aus dem Leben eines Glücklichen*.

BURR, AARON, 1716-57; a Connecticut teacher and clergyman; in 1738, pastor of the Presbyterian church in Newark, N. J., and in 1748 second president of the college of New Jersey. He published a Latin grammar, several sermons, and *The Supreme Deity of Our Lord Jesus Christ Maintained*. His wife was a daughter of Jonathan Edwards.

BURR, AARON, son of the clergyman Aaron Burr; b. N. J., Feb. 6, 1756; d. N. Y., Sept. 14, 1836. He was left an orphan before the age of three; graduated at Princeton in 1772; in 1775, went into the army as a private; at Arnold's attack on Quebec, acted as aid to Gen. Montgomery, and endeavored to bring off the body of that officer, who fell at his side. He acted as brigade-major to Arnold, and in May, 1776, he became a member of Washington's military family, which he left after a few weeks to become aid to Gen. Putnam. In 1777, he was made lieutenant-col., and won distinction at Monmouth in command of a brigade. In 1778-79, he was stationed near New York, and was for a short time in command of West Point. He was always opposed to Washington, whose military talents he esteemed very lightly. B. resigned in consequence of ill health in the spring of 1779, and three years later married Mrs. Prevost, the widow of a British officer, was admitted to the bar, and began the practice of law at Albany, N. Y. In 1784, and again in 1798-99, he was elected to the state assembly. In 1789, he was appointed attorney-general of the state, and in 1791 was chosen U. S. senator. He was an early, zealous, and unscrupulous partisan leader among the "republicans" (afterwards "democrats"), and the especial rival of Alexander Hamilton, the prominent leader of the federalists. In the presidential struggle of 1800, John Adams (then president), Thomas Jefferson, Charles C. Pinckney, and B. were the candidates, and the votes for Jefferson and B. were equal—73 for each. As the constitution then provided, the person having the greatest number of electoral votes was to be president, and the next highest was to be vice-president. This equal division devolved upon the house of representatives the settlement of the matter, and there each state had one vote only, a majority of all the states being necessary to elect. After a week of balloting, Jefferson was selected the president, B. being vice-president. He had been favored by Jefferson for that place from the first, but his ambition was higher, and he did his utmost to defeat Jefferson, who was the regular candidate of the party. This course politically ruined B.; he was thereafter trusted by no party, though in 1804 the federalists nominated him for governor of New York, the result being his defeat by Morgan Lewis. These disappointments and defeats, added to the intensely bitter character of the partisan warfare of the time, led to the duel (July 11, 1804) in which Hamilton was killed by Burr. For this act, which was then deemed little less than murder, B. was legally disfranchised in New York, and covered with the heavier curse of popular indignation. In the spring of 1805, he started for the western part of the country, bent, as was generally believed, upon establishing a government in the Mexican territories, and possibly comprising a portion of the Louisiana purchase. He bought a large tract of land on Red River, and intimated that the conquest of Mexican states was a part of the plan. It was in the course of these operations that he plundered the famous Blennerhassett (q.v.). President Jefferson caused him to be arrested (Feb. 19, 1807, in Alabama) on a charge of treason, for which he was tried the next month at Richmond, Va. The jury gave a verdict of acquittal, and the next year he visited Europe to raise the means for an attempt upon Mexico. Four years of effort amounted to nothing, and in 1812 he returned in extreme poverty, and began to practice law in New York; but his course had alienated the people, and he could never regain his position in the courts. At the age of 78 he married Madame Jumel, a widow, who had a large estate in the upper part of the city of New York; but they were soon afterward divorced, and B. died in 1836 on Staten Island in poverty and utter abandonment, not only because of his political course, but more in consequence of his social character. He had but one legitimate child, a daughter named Theodosia, who became

the wife of Joseph Allston, governor of South Carolina. This daughter was probably the only human being except himself whom B. ever really loved; and she sailed from Charleston in the spring of 1812 on a visit to her father (who had just arrived from Europe), but the schooner on which she was a passenger was never afterwards heard of. There have been many stories told of its fate, and three or more dying prisoners have given relations of their part in the robbery and destruction of the vessel, but none have proved trustworthy. The most probable theory is that the schooner foundered off cape Hatteras in a furious storm that came soon after she sailed. See Parton, *Life and Times of Aaron Burr* (1858); Mrs. Stowe's *The Minister's Wooing* (1859).

BURRANPOOTER. See BRAHMAPUTRA.

BURRIANA, a t. of Spain, in the province of Castellon-de-la-Plana, about 8 m. s. from the town of that name, is situated on the left bank of the Rio Seco, about 1 m. from its mouth in the Mediterranean. It has a pop. of about 10,000, who are chiefly engaged in agriculture and fishing; and exports wine, oil, and fruit.

BURRILL, JAMES, LL.D., 1772-1820; b. R. I.; graduated at Brown university, and in 1791 began practicing law. From 1797 to 1813, he was attorney-general of Rhode Island; in 1816, chief-justice; and in 1817, senator in congress, where he was an able opponent of the Missouri compromise.

BURRITT, ELIHU, a distinguished advocate of the doctrines of the peace society, and a linguist widely known as "the learned blacksmith," was born at New Britain in Conn., 1811. He was brought up to the trade of a blacksmith, but devoted all his leisure to study, especially to mathematics and languages. In the latter field of study, his range was very extended, embracing more or less Latin, Greek, Hebrew, Arabic, and other oriental tongues, and almost all modern European and Slavonic languages. He is, however, much better known to the world as an earnest apostle of peace than as a scholar. To preach the doctrine of "universal brotherhood," Burritt traveled much through Europe and the United States. His chief works are *Sparks from the Anvil*, *Olive Leaves*, *Peace Papers*, and *Lectures and Speeches*. He also took a prominent part in the peace congresses of Brussels, Paris, Frankfort, London, and Edinburgh; and in advocating an ocean penny-postage. For many years he resided in England, part of the time as U. S. consul at Birmingham. He d. 7th Mar., 1879. See *Life* by Northend (1879).

BURROUGHS, GEORGE, a graduate of Harvard, and preacher in Falmouth, Me., in 1876, and in Salem in 1880. He was accused of witchcraft in having "tortured, afflicted, pined, consumed, wasted, and tormented" one Mary Wolcott. Though a man of the most unblemished character, he was condemned and hung at Salem, Aug. 19, 1692.

BURROUGHS, JOHN, b. Roxbury, N. Y., 1837; began as school-teacher in his native village; married before he was twenty-one years of age, and went to New York, where he soon drifted into journalism. He received an appointment in the treasury department at Washington, 1863, but since 1874 has engaged in farming at Esopus, N. Y. His contributions to periodical literature have made him widely known as an enthusiastic lover of nature, especially in her uncultivated aspects, and a refined and appreciative critic. Many of his essays have been collected into book form under the following titles, *Wake Robin* (1870); *Winter Sunshine* (1873); *Birds and Poets* (1875); *Locusts and Wild Honey* (1878); *Pepacton* (1881); *Fresh Fields* (1884); *Signs and Seasons* (1886); *Indoor Studies* (1889); *Riverby* (1894); *The Writings of John Burroughs* (9 vols., 1895), etc.

BURROUGHS, STEPHEN, 1765-1860; b. New Hampshire; successively a soldier, student at Dartmouth college, privateer, physician, and pastor of a Congregational church, until convicted of passing counterfeit money, when he was imprisoned. Escaping to Canada, he continued his counterfeiting. Late in life he became a Roman Catholic, and ended his days as a private teacher. He published *Memoirs of My Own Life* (1811-1848).

BURROWING OWL, or COQUIMBO OWL, *Athene cinicularia*, a species of owl that lives in the burrows of the prairie dog, or digs a home for itself; and seeks its prey (chiefly small insects) in daylight rather than, like other owls, in the night.

BURROWS, WILLIAM, 1785-1813; entered the U. S. navy in 1779, and served on the Barbary station. In the war with England he commanded the *Enterprise* in the engagement with the *Boxer*, off Portland, Me., Sept. 5, 1813. The *Boxer* was taken; but B. was mortally wounded, living only long enough to receive the surrender. The English commander was also killed, and both officers were buried near each other at Portland.

BURESTONE. See BUHRSTONE.

BURSARY (Fr. *bourse*, Lat. *bursa*, a purse), the annual proceed of a sum permanently invested for the maintenance of a student at a university. A number of small bursaries were till lately the only equivalents at the Scotch universities for the scholarships of the English. Their large number and the small amount of each was, in course of time, found to have a prejudicial effect, more particularly at Aberdeen, which possessed the largest number, and where a practice had obtained of multiplying bursars on the

foundation, at the discretion of the senatus or patrons. Both the university commissioners of 1831 and those of 1863 expressed their opinion that it was less provision for encouraging learning in its earlier stages than adequate inducements to persons who have passed the preliminary class to make learning the business of their lives, that was wanted in Scotland. The general effect of the ordinances issued by the commissioners of 1863, in carrying out the directions of act 21 and 22 Vict. c. 83, was to consolidate some of the smallest bursaries into others of greater value, and in some instances to remove restrictions that had proved injurious, while a large number was thrown open to competition. There are, however, still a large proportion of purely presentation bursaries, and in some there is a preference given to a particular name, or to natives of a particular district. At Aberdeen, the commissioners founded eight scholarships of £65 annual value; at St. Andrews they so modified the Ramsay foundation as to found two scholarships of £60; and in Edinburgh they acquired funds sufficient to establish the Pitt and Mackenzie scholarships of £60 and £120 annual value. Since 1863, a large number of scholarships, tenable by graduates, and of fellowships, have been founded by private individuals on a more liberal scale than the old bursaries, particularly in Edinburgh and Glasgow. At Edinburgh there are at present about 200 bursaries, of which above 100 are in arts, and 30 in theology; they vary in amount from £2 15s. 6d. to £100. Among the most considerable of them are two of £90, founded in 1809 by Dr. Donald Grant, for students of his own surname; one founded by sir John Macpherson in 1821, worth £88, for Highland students; the Jardine competition bursary of £40, four Lennie bursaries of £48, four Bruce bursaries of £30, and three of £40; two competition bursaries of £100 and £50 respectively, founded in 1860 by Mr. Patrick of Roughwood, for young men educated in Ayrshire; two bursaries founded in 1865 by Miss Scott of Horselehill, and one by Miss Harrison in 1867, for £40 each; and two founded by the Rev. John Spence in 1867, for £50. The scholarships for graduates are about 30, varying in amount from £60 to £120; and there are about eight fellowships, varying from £100 to £160. Of 200 bursaries at Glasgow, many of them small, the most considerable are six founded by lord Dundonald in 1672, four in philosophy and two in divinity, of £40; two by Mr. Patrick, of £100 and £50 respectively; and the Brisbane medical bursary of £50, founded in the year 1877. Glasgow has also 14 exhibitions to Balliol college, Oxford, on the Snell foundation (q.v.), and has about 30 scholarships of from £50 to £200, the highest being the four founded by Mr. George A. Clark, in 1872. At St. Andrews there are 81 bursaries belonging to the United college, these varying in amount from £5 to £50; 20 belonging to St. Mary's, varying from £6 to £50; and 20 of the same value transferable from the United college, when the bursars proceed to the study of divinity; two Ramsay scholarships of £50; one Guthrie scholarship worth £100 the first year and afterwards worth £50; one Patrick Kidd scholarship, worth about £40; and two scholarships of £50, founded by Mrs. Tyndal Bruce. At Aberdeen there are about 250 bursaries, varying from £5 to £50; and 11 scholarships of £65 to £70, tenable for 4 years, also some valuable exhibitions to Cambridge.

BURSCHENSCHAFT, an association organized by German students for the purpose, originally, of reforming the excesses and outrages customary at the universities of Germany, and to arouse a spirit of nationality by uniting the students of different universities. The first organization of the B. took place at Jena in 1815, and most of the students who became members had fought in the German war of independence; during 1815-17 it spread to Tübingen, Heidelberg, Halle, and Giessen. As it was evident that the students were to be disappointed in the hope that the war would be followed by political reforms, the B. of Jena decided to have a general gathering of the associations, which took place at the Wartburg, Oct., 1817. At this festival all the universities were represented, and in Oct. of the following year, delegates from 14 universities adopted a constitution, which was agreed to by all except the universities of Austria, Göttingen, and Landshut; they adopted the colors of the German empire, black, red, and gold, and resolved to hold annual conventions. In 1819, Kotzebue, the German dramatist, who had been declared by the B. a traitor to his country, was assassinated by Sand. After a conference at Carlsbad, the German government took steps to suppress the B., but without avail; it resulted only in their holding secret instead of public meetings. The original plan of a national B. was revived in 1827; the chief obstacle was the difference of view held by the Germanen, who desired to bring about the unity of Germany by practical and political means, and the Arminen, who laid more stress on the ideal unity of their country and the cultivation of individual powers. The views of these two parties were discussed at the convention of Bamberg in 1827, and in Frankfort in 1831; and, although the Arminen had the larger number of followers, they were obliged to give way to the more energetic Germanen. On the 25th of Dec., 1832, the B. resolved to attain the freedom and unity of Germany by a revolution; all the students were called upon to support the B., whose headquarters were at Frankfort-on-the-Main. The attempt was made at Frankfort in June, 1833, in which nearly 2000 students were implicated. It resulted in the arrest and prosecution of students at all the German universities, and many of them were imprisoned and disfranchised. The students of Vienna, who had never before been connected with the B., took a prominent part in the revolution of 1848.

BURSIAN, CONRAD, an archaeologist and classical scholar, b. in Saxony, Nov. 14, 1830, and educated at Leipzig. He held professorships in the universities of Leipzig, Tübingen, Zürich, Jena and Munich, and was the author of a history of classical philology in Germany (1883) and of a work on the geography of Greece. He died in 1883.

BURBLEM, a t. of Staffordshire, on the Trent and Mersey canal, in the pottery district, is a station on a branch of the North Staffordshire railway. It forms part of the parliamentary borough of Stoke-upon-Trent. Pop. '91, 30,862. The abundance of coal and the variety of clays have made B., since the 17th c., one of the chief seats of the fictile manufacture. Porcelain and pottery of all kinds—Parian, iron and stone ware, etc.—are produced on a large scale, as well as encaustic tiles. There is also a glass manufactory here. The affairs of the town are managed by a "local board of health." At Birche's head, a mile and a half from B., stands a large service reservoir of the Staffordshire waterworks company, from which the town and neighborhood are supplied with excellent water. A fine new town-hall was erected in 1865, which, besides the usual municipal offices, contains lecture rooms and news rooms. B. was the native place of Josiah Wedgwood, who in the middle of the 18th c. greatly improved the manufacture of pottery.

BURT, a co. in e. Nebraska, on the Missouri river and the Chicago, St. Paul, Minneapolis, and Omaha railroad; 468 sq. m.; pop. '90, 11,069. Co. seat, Tekamah.

BURTON, ASA, D.D., 1752–1836; a graduate of Yale in 1777; in 1779 settled as pastor of a Congregational church in Thetford, Vt., where he remained all his life. He published many sermons, and *Essays on Some of the First Principles of Metaphysics, Ethics, and Theology*. See *Memoir* by Thomas Adams.

BURTON, JOHN HILL, advocate (member of the Scottish bar), achieved for himself a place in the world of letters by a variety of works, all remarkable for ability, and several for original thought. B. was born at Aberdeen on the 22d of Aug., 1809; his father was an officer in the army, and his mother the daughter of an Aberdeenshire laird. Having graduated at Marischal college, Aberdeen, he became an apprentice to the profession of law in his native city; which, however, he afterwards abandoned for the higher sphere of the Edinburgh bar. Here, with time on his hands, he devoted himself to study and letters. For a long series of years, from 1833 downwards, he was a contributor to the *Westminster Review* of articles on law, history, and political economy; and for several years he contributed to *Blackwood's Magazine* literary sketches. Among his original works may be mentioned, *The Life and Correspondence of David Hume*, 2 vols. (1846); *Lives of Simon Lord Lovat and Duncan Forbes of Culloden* (1847), both excellent biographies; *Political and Social Economy* (1849), which is a valuable, condensed, and lucid contribution to the literature of social science; *Narratives from Criminal Trials in Scotland*; *A Manual of Scottish Law*; *A Treatise on the Law (Scottish) of Bankruptcy*; *The History of Scotland from the Revolution to the Extinction of the Last Jacobite Insurrection*, 2 vols. (1853); *The History of Scotland from Agricola's Invasion to the Revolution of 1688*, 7 vols. (1867–70); *The Book-Hunter* (1862); *The Scot Abroad*, 2 vols. (1864); *The Cairngorm Mountains* (1864). A new edition of the *History of Scotland*, enlarged and partly rewritten, appeared in 8 vols., 1873. Burton edited vols. i. and ii. of the *Register of Privy Council (Scotland)* for 1545–78; and in 1879 he brought out a history of the reign of queen Anne. The high merits of B.'s historical works have been universally admitted. He further edited the works of Jeremy Bentham (nominally in conjunction with the late sir John Bowring), with an able introduction; and he published a volume of *Benthamiana*. B. was, in 1854, appointed secretary to the prison board of Scotland; and on the abolition of that board in 1860, he remained as stipendiary manager and secretary in connection with the Home office. On the passing of the prisons (Scotland) act, 1877, B. was appointed one of the prison commissioners for Scotland. He held the old office of historiographer royal for Scotland, was LL.D. of Edinburgh university, and D.C.L. of Oxford. He d. Aug. 10, 1881.

BURTON, SIR RICHARD FRANCIS, one of the most daring and successful of modern travelers, was b. in Hertfordshire, England, March 19, 1821. He was educated in France and England. In 1842, he entered the Indian army, and served many years in Sindh. While in this employment, he exhibited a remarkable facility in acquiring the eastern languages, and a still more remarkable dexterity in imitating the appearance and habits of the natives of India. In 1851, he published his first important work—*Sindh, and the Races that inhabit the Valley of the Indus*—full of graphic description, and interesting to all readers. B. had acquired a very familiar acquaintance with Hindustani, Persian, and Moulani. He had devoted special attention to Arabic, and had made such progress as to be able to speak it like a native. Possessed of these qualifications, he resolved to explore Arabia in the disguise of an Afghan pilgrim; and after a visit to England, he set out on his journey. Political commotions prevented him from traversing the whole country, as he intended; but his *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (1855) records one of the most daring feats on record. A perpetual strain on the ingenuity was necessary to keep up his assumed character, most difficult in moments of fatigue, and in the midst of shrewd and observant fellow-travelers. The next journey undertaken by B. was into the country of the Somaulis, in eastern Africa. It proved less successful than was anticipated. B.'s com-

panion, Lieut. Stroyan, was killed, and B. himself was wounded. He succeeded, however, in reaching Harar (q.v.), a most important town in eastern Africa, not before visited by any European, and in penetrating a vast and populous region scarcely known to geographers. The journey led to a still more important series of expeditions—those to the country of the upper Nile. Towards the end of 1856, B. set out in company with Lieut. Speke, also of the Indian army, to ascertain the truth of the reports collected by the missionaries, that a vast sea existed in the heart of the continent. The journey is one of the most memorable of our time. It led to the discovery and exploration of the great lake of Tanganyika, and the opening up of the eastern part of the continent. B. was rewarded with the medal of the geographical society. His health had been affected by his African journeys, and he sought to recover it by a journey in North America, from which he brought the first reliable account of the Mormons. In 1861, B. was appointed consul at Fernando Po, on the w. coast of Africa, and while holding this appointment, he visited the Cameroon mountains, and went on a mission to the king of Dahomey, the incidents of both journeys being recorded in two of his most interesting works. B. was subsequently the consul at Santos in Brazil, and at Damascus; and on the death of Mr. Charles Lever in 1872, B. succeeded him in the post of British consul at Trieste. B. visited the Guinea coast, '82. He died in 1890.

The following is a list of the principal works of Capt. B. not mentioned above: *Sindh, or the Unhappy Valley* (1851); *Goa and the Bue Mountains, or Six Months of Sick Leave* (1851); *Falconry in the Valley of the Indus* (1852); *First Footsteps in East Africa, or an Exploration of Harar* (1856); *The Lake Regions of Central Africa, or a Picture of Exploration* (1860); *The City of the Saints, and Across the Rocky Mountains to California* (1861); *Abeokuta, or the Cameroon Mountains* (1863); *The Nile Basin; A Mission to Gelele, King of Dahomey, with Notices of the so-called Amazons, etc.; Explorations in the Highlands of Brazil; Vikram and the Vampire; Zanzibar; Two Trips to Gorilla Land; Ultima Thule, or a Summer in Iceland; Etruscan Bologna* (1876); *Sindh Revisited* (1877); *The Gold Mines of Midian and the Ruined Midianite Cities* (1878), giving an account of B.'s investigations in that region during journeys in 1876 and 1877; *To the Gold Coast for Gold*, 1882. In 1885-88 he published a literal translation of the *Arabian Nights* (q.v.), under the title of *The Thousand Nights and a Night* (10 vols., and 6 vols. of supplement), of which his wife issued an expurgated edition for popular perusal. Lives by Hitchman (1887), his wife (1894), and Georgiana M. Stisted (1897). He left a MS. to his widow, Lady Isabel Burton, consisting of a translation, with original notes, from the Arabic of *The Scented Garden*, which she destroyed as a moral act, though it had been valued at \$30,000. She d. in London, in 1896.

BURTON, ROBERT, author of the *Anatomy of Melancholy*, was b. at Lindley, in Leicestershire, in 1576, and studied at Brasenose and Christ church, Oxford. In 1616, he was appointed to the vicarage of St. Thomas, and in 1628, to the rectory of Segrave in his native county. He appears, however, to have continued all his life at Christ church, where he died in 1640, leaving legacies of £100 each to the Bodleian and Christ church libraries, and as many of his books as they did not already possess. A monument was erected to his memory in Christ church cathedral. B. is described by Anthony Wood as a good mathematician, a dabbler in nativities, a well-read scholar, and a thorough-paced philologist. "As he was by many accounted a severe student, and a melancholy and humorous person, so by others who knew him well, a person of great honesty, plain-dealing, and charity. I have heard some of the ancients of Christ church often say that his company was very merry, faceté, and juvenile." His *Anatomy of Melancholy*, in which he appears under the title of Democritus Junior, is one of the most curious *melanges* of heterogeneous elements ever put together. It consists mainly of an extraordinary mass of quotations from old and obscure writers, strung on a thread of rambling reflection; often tiresomely pedantic, but relieved by quaint touches of humor and feeling.

BURTON, WILLIAM EVANS, 1804-60; b. London; son of William George B., author of *Biblical Researches*. He was intended for the church, and received a classical education; at 18 took charge of his father's printing establishment and edited a magazine. From amateur acting he drifted towards the regular stage, and made a successful début at the Haymarket, in 1832. He began also to write dramas, one of which was played simultaneously at five London theaters. In 1834, he came to the United States, where he was always prominent as actor or manager, chiefly in Baltimore, Philadelphia, and New York. In Philadelphia he established the *Gentleman's Magazine*, a literary monthly. His greatest success was in the management of the Chambers street theater, New York, where, with Brougham and others, he produced dramas from several of Dickens's novels. His own forte was low comedy, and some of his characters were so established in public favor that no actor has satisfied an audience in them since his death. Such were "Captain Cuttle," "Toodles," "Micawber," "Aminadab Sleek," "Paul Pry," and others. He was a fine scholar, and had a superior library, particularly of Shakespearian literature. He was for several years the editor of the *Literary Souvenir*, and published in two vols. a *Cyclopædia of Wit and Humor*.

BURTON-ON-TRENT, a market t. in Staffordshire, on the river Trent and the Midland railway. The Grand Trunk canal also passes the town, and enters the Trent below. A bridge of 34 arches, built before the Norman conquest, here crossed the river,

but was replaced in 1864 by a new one of 29 arches. The population of B. has been nearly trebled within the last 20 years, being in 1891, 46,047. This is owing to the rapid extension of the brewing of ale, which is the staple product of the place. There are numerous breweries in B., some of them on a scale of unparalleled magnitude. The two establishments of Bass and Allsopp cover together more than 250 acres of ground, and can produce yearly about two million barrels of ale. There are, of course, extensive cooperages, and also iron-foundries. The public edifices are not particularly noticeable.

BURTELL, RICHARD LALOR, PH.D., D.D., was born in New York, April 14, 1840. He pursued his studies at the Propaganda in Rome, taking his degree there, and receiving his ordination in 1862. Returning to America he was appointed assistant pastor of St. Ann's church, and in 1868 assigned to the new parish of the Epiphany. He was the first incumbent in the office of "Defender of the Marriage Tie" (q.v.), instituted in America by the Third Plenary Council of the Catholic church, held in Baltimore in 1884. In 1887, he identified himself with a movement in which the Rev. Dr. McGlynn (q.v.) was concerned, and was counsel and adviser to Dr. McGlynn after his suspension from priestly functions. This involved him in personal trouble. He was removed from the office of "Defender of the Marriage Tie" in 1887; official notice of his action was taken in 1889; and he was ordered to retire from his position as pastor of the Church of the Epiphany, to a small parish in Rondout, N. Y. He appealed from the order of the Archbishop to the Propaganda at Rome, and by that body was ordered to make his submission to the archbishop. He preached his farewell sermon to his congregation in July, 1890; appealed to Rome for reinstatement; and was refused, in 1896.

BURTSCHIED, or BORCETTE, a t. of Rhenish Prussia, about half a mile distant from Aix-la-Chapelle, with which it is connected by an avenue of trees. It has manufactures of woollen cloths and cassimeres, and celebrated sulphur springs and baths, with a temperature of 106° to 155° F. Pop. '90, 13,388.

BURY, a flourishing manufacturing t. in the s.e. of Lancashire, on a rising ground backed by hills on the n. and e., between the Irwell and the Roche, 9 m. n.w. of Manchester. It was early a seat of the woollen manufactures, carried on by Flemings, but these, though still considerable, now yield in importance to those of cotton. Besides spinning and weaving factories, there are important print, bleach, paper, and dye works, and some large foundries and engine manufactories. In the vicinity are excellent free-stone quarries, and abundant coal-mines. The town has recently been much improved in drainage, and an ample supply of water has been secured from hills at a distance. Pop. '91, 57,212. B. returns one member to parliament. Some improvements in the cotton manufacture arose here.

BURYING BEETLE, *Necrophorus*, a genus of coleopterous (q.v.) insects, of the tribe or family *silphales*, with short club-shaped antennæ, remarkable for their habit of burying the bodies of mice, moles, and other small animals, in order to deposit their eggs in them, and to provide a supply of food for their larvæ. Some of the species are natives of Britain, among which is *N. vespillo*, the species of which the habits were first observed, which is, however, more common in some parts of continental Europe. It is a black beetle, about an inch long, with two bright orange bands across its back, and having an excessively fetid smell, which long adheres to whatever it touches. Its sense of smell would seem to be extremely acute, and a dead animal soon attracts it, a pair generally arriving together, male and female, to feed upon the body, and the male to proceed to its interment, if sufficiently small, previous to which, however, they have sometimes to drag it to some distance to a place suitable for their purpose. The head of the insect is the only tool employed in the operation, and is held sloping outwards, and employed in a manner which exhibits great muscular power. A furrow is first made around the body, then another within the first, and so on till the earth is so excavated from beneath, that the body begins to sink, when the insects, by great efforts, drag it down into the hole, and when it is fairly in, the excavated earth is thrown back over it. The female then lays her eggs in it; and when this is accomplished, and the cravings of appetite are satisfied, it is left for the larvæ, which are of a lengthened form, with six feet.

BURY ST. EDMUNDS, or ST. EDMUNDSBURY, an ancient borough in Suffolkshire, on the Upper Lark, 26 m. n.w. of Ipswich. It is well built, and delightfully situated. Pop. '91, 16,630. It returns two members to parliament. It has a trade in wool, butter, corn, and cheese, but no manufactures. A very complete system of drainage has been carried out, the sewage being conveyed to a distance, and, by means of pumps, applied to irrigation. A new corn exchange was erected in 1862; in 1864, the Suffolk general hospital was rebuilt. B. received its name from Edmund, the Saxon king and martyr, who was crowned here on Christmas day, 856; taken prisoner, and put to death by the Danes. On the site of his tomb, six priests founded a monastery: and here Canute raised a Benedictine abbey, which in time became the richest and most important in England, save that of Glastonbury. From 1020 to its dissolution by Henry VIII. it was ruled over by a line of 33 abbots. The abbot was a spiritual baron of parliament, had judicial authority in all causes within the liberty of B., had the power of inflicting capital punishment, and the privilege of coining. At the dissolution, the annual income was equivalent to about £50,000 sterling. Of this magnificent establishment, little now remains but the western gate, erected in 1327, a noble relic of the decorated Gothic

style; and the "church-gate," a quadrangle tower of massive simplicity, 86 ft. high. The churchyard, to which this tower formed the portal, includes, besides the abbey ruins and some other buildings, the fine old churches of St. Mary and St. James. The celebrated grammar-school of B. was founded by king Edward VI. in 1550, and is free to sons of the inhabitants of the town. It has 2 scholarships at Cambridge, and 6 exhibitions to each university, and has produced many eminent scholars. Among the many religious and charitable institutions connected with the abbey, of which portions still exist, is St. Saviour's hospital, founded by that notable abbot, Samson, whose life and actions, as recorded by Jocelyn of Brakelond, Mr. Carlyle has so vividly recalled in his *Past and Present*. The poet Lydgate was a monk in this abbey; and sir Nicholas Bacon was born here.

BUSACHI NO, or **BISACQUI NO**, a t. of Sicily, in the province of Palermo, about 29 m. s.s.w. of the city of that name. It has manufactures of linen, and a population of about 9000.

BUSA CO, a ridge or serra on the n. side of the river Mondego, in the province of Beira, Portugal, about 20 m. n.n.e. of Coimbra. Here Wellington, with about 40,000 British and Portuguese troops, repulsed the attack of Massena with 65,000 French, 27th Sept., 1810. Unable to force the position, Massena turned it by a pass over an adjoining ridge, and Wellington retired behind the lines of Torres Vedras, which indeed it was his intention to do, even if there had been no battle.

BUSEY, **RICHARD**, the most famous of English schoolmasters, was b. at Luton, Northamptonshire, Sept. 22, 1606. Educated at Westminster school, and Oxford, he was, in 1640, appointed head-master of Westminster school, the duties of which office he continued to discharge until his death in 1695. He is the type of pedagogues alike for learning, assiduity, and the application of the birch. He was a most successful teacher, and at one time could point to no less than sixteen occupants of the bench of bishops who had been educated in his school; and altogether, he has the reputation of having "bred up the greatest number of learned scholars that ever adorned any age or nation." He published several works, but they were chiefly for school use.

BUSCA, a t. of Piedmont, situated on the left bank of the river Maira, an affluent of the Po, about 9 m. n.w. of Coni. Excellent wine is produced in the vicinity. Pop. about 9000.

BUSCH, **JOHANN GEORG**, 1728-1800; a German philanthropist and statistician, professor of mathematics in the Hamburg gymnasium. He established an association for the promotion of art and industry, and a school of trade, the latter becoming especially famous. He wrote largely upon the history and theory of trade and commerce, and on questions of political economy.

BUSCH, **JULIUS HERMANN MORITZ**; b. Dresden, 1821; studied theology and philosophy at Leipsic, but began literary life as a translator of Dickens, Thackeray, and other English authors. In 1851 he visited the U. S.; in 1852 he published *Wanderings between the Hudson and the Mississippi*. Subsequently he became known as a political writer, and in 1870 received an appointment in the foreign office at Berlin, which brought him into close relationship with Bismarck, whose views he ardently embraced. A part of his diary kept during the French campaign, was with Bismarck's permission published in 1878 under the title of *Count Bismarck and his People*, and made a great stir in Europe and the U. S.

BÜSCHING, **ANTON FRIEDRICH**, a celebrated geographer, was b. Sept. 27, 1724, at Stadthagen, in the principality of Schaumburg-Lippe, Germany. He studied theology at Halle, where he enjoyed the friendship of Baumgarten. In 1754, he was appointed extraordinary professor of philosophy in Göttingen, but soon incurred the displeasure of the Hanoverian government by his religious heterodoxy. Göttingen thus becoming an unpleasant residence to him, he accepted an invitation, in 1761, to St. Petersburg as preacher to a Protestant congregation there. In 1765 he returned to Germany, and in 1766 was called to Berlin as upper consistorial councillor and director of a *Gymnasium* in Berlin, where he died, May 28th, 1793. Until the appearance of B.'s *Erdbeschreibung*, the first volume of which was published at Hamburg in 1754, neither Germany nor any other nation possessed a geographical work which made any pretension to scientific treatment or completeness of execution. The changes in the political arrangements of the world have, however, deprived the work of its original value, but it has been corrected and edited by subsequent writers. Of his other numerous publications, the most important is the *Magazin für Historie und Geographie* (25 vols. Hamburg, 1767-93).

BUSEMBAUM, **HERMANN**, a theologian of the order of Jesuits, was b. in 1600 at Nottelen, in Westphalia. About 1640, he taught ethical philosophy at Cologne, and later was appointed rector of the college of Jesuits at Münster. He died 31st Jan., 1678. His work entitled *Medulla Theologicæ Moralis* (1645), was celebrated as a standard authority in the seminaries of the Jesuits, though several of its propositions were condemned by the pope. It has gone through more than fifty editions. It was enlarged by the Jesuit Lacroix (1707), and re-edited, with improvements and additions, by the Jesuit Montausan in 1729, and again by Alfonso de Ligorio in 1757. As it was found that the work contained doctrine in favor of regicide, it was burned, by order of the parliament of Toulouse, on the occasion of an attempt made on the life of Louis XV. by Damiens in 1757.

BUSENTO, a river of Salerno, Italy, emptying into the bay of Busento. This is the stream that was turned from its channel by the followers of Alaric, who buried that great leader in the original bed of the stream and then restored the water to its natural course so that no enemy could find the grave.

BUSH, GEORGE, D.D., 1796-1859; b. Vt.; a graduate of Dartmouth college and Princeton seminary; ordained in the Presbyterian church, and four years a missionary in Indiana. In 1831, he was appointed professor of Hebrew and oriental literature in New York university. In 1832, he published a *Life of Mohammed*, and the next year a work on the millennium, in which he held that the beginning of the millennial age was marked by the triumph of Christianity over Roman paganism. He also wrote a Hebrew grammar, and seven volumes of commentary on the Old Testament. In 1844, he conducted *The Hierophant*, devoted to the explanation of prophetic symbols, and published a work in which he opposed the idea of a physical resurrection of the body. In 1845, he united with the New Jerusalem church, and began to translate Swedenborg's works. In support of these doctrines, he edited the *New Church Repository*. His latest work was *Priesthood and Clergy unknown to Christianity*.

BUSH ANTELOPE, **BUSH BUCK**, and **BUSH GOAT**, names common to a number of species of antelope (q.v.), natives chiefly of the southern and western parts of Africa, forming a section of the genus *antelope*, which some naturalists have attempted to erect into a distinct genus (*philatomba* or *cephalopus*). They are animals of more compact form, shorter limbs, and greater strength, but much less agility, than the true or typical antelopes. They are remarkable for the arched form of the back. They have short, straight, or slightly curved horns, situated far back, and generally peculiar to the male sex, with usually a long tuft of hair between them. They have no tear-pits, but instead of them, a naked glandular line, formed of two series of pores, on each cheek. They frequent jungles, thick forests, and beds of reeds, and when pursued, seek to escape by diving into a thicket. The common or white-backed B. A. of Sierra Leone (*antelope sylvicultrix*) is about 3 ft. high at the shoulder; it is a dull, heavy, awkward-looking animal; keeps concealed in the thickets during the day, living singly or in pairs, and feeds in the open spaces in the early mornings only. To shoot it, sportsmen place themselves on the margin of the woods, and watch their opportunity as it comes out to graze. Its flesh is more esteemed than that of the more agile antelopes. Nearly 20 other species are usually ranked in this section of antelopes, among which is the *kleene boc* (*antelope pygmaea*) of s. Africa, a species abundant in many parts of Cape Colony, of very small size, not more than one foot in height at the shoulder, and with horns only about 1½ in. in length. It is a timid, gentle animal, easily domesticated. It differs from the typical bush antelopes in the great activity which it displays.

BUSHEAB', a low, flat island in the Persian gulf, about 11 m. from the Persian coast, in lat. 26° 50' n., long. 53° 12' east. It is about 18 m. long, narrow, and well-peopled, with a town and harbor at its western extremity. Its proper name is *Khosharab*, signifying "good water."

BUSHEL [Fr. *boisseau*, allied to *boi(s)te*, box, butt; Lat. *butta*, a measure in general], a dry measure used in America for grain, fruit, etc. The quarter contains 8 bushels, and the bushel 8 gals. the gallon measuring 277.274 cub. in., and holding 10 lbs. avoirdupois of distilled water. Hence the imperial bushel contains 80 lbs. of water, and measures 2218.2 cub. inches. The old Winchester bushel measured 2150 cub. in.; hence 33 Winchester bushels. = 32 imperial bushels. nearly.

BUSHIRE. See **ABUSHEHR**.

BUSHMAN'S RIVER, or **BOSJESMAN'S RIVER**, in the e. part of the Cape Colony, s. Africa, is about 200 m. long, and forms on its lower course the w. boundary of Albany, whose capital is Graham's Town. Its general direction is from n. to s., its mouth being about 33½° s., and about long. 26½° east.

BUSHMEN, or **BOSJESMANS**; so named by the Dutch colonists, but calling themselves **SAAB**, or **SAAN**; an aboriginal race of s. Africa, somewhat like, and yet differing from, the Hottentot, but like them having nothing in common with the Kaffer or negro. They rank with the savage of Australia among the lowest existing types of mankind, and are in a most degraded and destitute condition. They are of small stature, of dirty yellow color, and very repulsive features. The cheek-bones are large and prominent; the eyes deep set and crafty in expression, nose small and depressed, and the hair in small woolly tufts with bald spaces between. Of 150 measured by a traveler, the tallest man was 4 ft. 9 in., and woman 4 ft. 4 in. Some are well proportioned, active, and capable of enduring great privations and fatigue. Those furthest n., near lake Ngami, are considerably larger in body. They clothe in skins and are fond of ornaments, decorating their arms and legs with beads and rings, and the women sometimes paint their faces red. They dwell in huts of reed or in holes in the ground; in the mountain districts they live among the rocks with mats for shelter. They have no cattle, nor any animals except a few half-wild dogs, nor have they the least signs of agriculture; but as they live by hunting they are well acquainted with the habits of animals, and follow the herds of antelope in their migrations. Their weapons are bows and arrows, the latter tipped with bone or iron, and poisoned with vegetable matter

mixed with the venom of snakes or spiders, or the entrails of an extremely poisonous caterpillar are used alone. On account of the use of these fatal poisons the B. are held in dread by neighboring tribes. The discovery of their rude tools for digging tubers, scattered over wide regions not now occupied by them, indicates the existence of greater numbers of B. in earlier times. They have no approach to tribal organization, nor any chiefs; bodily strength forming the only distinction of superiority. Their various dialects are not understood by the Hottentots, the tongue of the latter being more agglutinative, that of the B. more monosyllabic; the Hottentots use gender in names, while the B. do not. The Hottentots can count 20; the B. only 2—calling all above that "many." The B. possess a pictorial faculty not known in any other south African tribe, and the rocks of the Cape Colony and Drakenberg mountains show many examples of Bushman drawings of men, women, children, and animals. Rings, crosses, and other signs, drawn in blue on rocks and stones, and believed to be centuries old, have given rise to the suggestion that these may be the remains of hieroglyphic writing.

BUSHNELL, HORACE, D.D., 1802-76; b. Conn., graduated at Yale in 1827, where he studied law and theology; in 1833, became pastor of the North Congregational church in Hartford. He was a voluminous writer on theological subjects; some of his works being *Principles of National Greatness*; *Christian Nurture*; *God in Christ*; *Christian Theology*; *Sermons for the New Life*; *Nature and the Supernatural*; *Work and Play*; *Christ and His Salvation*; *Woman's Suffrage*, *the Reform Against Nature*; *The Vicarious Sacrifice*. He was also a writer for various periodicals and newspapers. He was a bold and original thinker, with peculiar eloquence of style. Though strongly evangelical in belief, he denied the Calvinistic theory of the atonement (known as the "satisfaction theory"), and gave less than the ordinary emphasis to the distinction between the persons in the Trinity. These, with other divergences, led to his being accused of heresy; but ultimately the fellowship of the Congregational churches was found broad enough to include him, and he kept his standing therein with growing influence until his death. During his later years his health compelled his relinquishment of the active pastorate, but his labors in authorship were unintermitted. While his theory of the atonement has not commended itself in its exact form to the majority of evangelical Christians, and is adhered to by no organized sect or party, it cannot be denied that his moral earnestness, his spiritual power, his wondrous suggestiveness, his brilliancy of thought and style, and his broad mental scope, have profoundly modified the thinking of the present age through almost the whole circle of Protestant denominations. Indeed, with his detestation of all provincialism and sectarianism, he would have chosen any other form of influence rather than that which is exercised by the leader of a party in the church.

BUSHRANGERS, in Australia, were originally runaway convicts, who had taken to the "bush" and become robbers. In the early years of the century they established a reign of terror in what was then the sparsely settled Van Diemen's Land. In 1814 a band of bushrangers, 27 in number, carried on their operations till, in 1815, martial law was proclaimed in the district by the lieutenant-governor. Stern measures were taken to repress the crime. Under Governor Arthur (1824-36), 103 criminals were executed in two years. In 1830, a severe Bushranging Act was passed in New South Wales, where at one time a gang of fifty desperadoes in the Bathurst district fought regular engagements with the settlers and police, and only surrendered when a detachment of soldiers was brought up from Sydney. Ten of these men were executed, and the act, which was renewed in 1834, put a stop to bushranging on this scale. Outbreaks still occurred at intervals, as in 1840, but generally only three or four ruffians would band themselves together and, after a more or less brief and desperate course, would be captured or killed by the mounted police. In later years bushranging has been unfortunately facilitated by the colonial land laws, which allow people to settle in isolated spots among the mountains, beyond the reach of educational or religious influences, and outside the range of police supervision, and thus any scoundrel is permitted to choose the most remote haunt for his headquarters, to which he can retire after his raids. The pathless, thickly-wooded, mountainous districts of Eastern Victoria and New South Wales, with a cattle-dealing population that included numerous "sympathizers," have offered shelter to many bushrangers.

BUSHWHACKERS, a term much in use during the civil war (though well known before) to indicate men who pretended peace or neutrality, but who were ready to make secret attacks whenever opportunity offered. They were numerous in some western states, where many of them were summarily shot as outlaws.

BUSYRIS, an Egyptian t., capital of the B. nomos, in the hieroglyphic language, the "Place of Osiris," believed to correspond to the modern Abusir, and situated about the middle of the delta. It was supposed to be near the entrance of the gates of Elysium. Close to B. was the pyramid of king Sahura, of the 4th dynasty, known as the Sa-ba, or "pyramid of the rising soul." The shrine of the goddess Isis was in B. and a great annual festival and lamentation for Osiris was held there. The place was destroyed by Diocletian, but the Copts and Arabs have preserved the name in Bousiri and Abusir.

BUSKIN, a kind of half-boot, lacing tight to the leg. The ancient tragedians wore buskins (*cothurni*), often with thick soles, to add to their stature. Hence the B. is often put for tragedy, as the slipper (*soccus*, a flat-soled shoe) for comedy. In ancient sculpture.

Diana, and hunters in general, as well as men of rapk and authority, are represented in buskins often highly ornamented.

BUSS is the name of a small vessel, usually from 50 to 60 tons' burden, much used in the herring fishery, especially by the Dutch. The B. has two small cabins—the one at the prow serving as a kitchen. The remaining space is a receptacle for fish.

BUSSAHIR' (or *Bashahr*), a hill-state of Northern India, in the Punjab, on the border of Chinese Tartary (32° n. and 78° e. cross in its area). It is one of the most elevated and mountainous countries in the world, the lowest part being more than 3000 ft. above the sea, and much of it from 7000 to 12,000 feet. The Sutlej flows through the country from e. to w.

BUSSANG, or **BUSSA**, a town in Central Africa on an island in the Niger, in the western part of the Soudan. It is celebrated as the place near which Mungo Park, the great African traveler, was murdered. Its population has been variously estimated at from 10,000 to 18,000.

BUSSEY, **BENJAMIN**, 1757–1842; served as a private soldier in the revolutionary army; after the war, began business in Boston and accumulated a fortune, most of which, after the death of certain relatives, went to the support of the law and divinity schools in Harvard college, and the founding of a school of agriculture, for which special object he gave a large farm near Boston.

BUSSON, **CHARLES**, French landscape painter, b. in 1822, received a first-class medal at the Paris Exposition in 1878, and became an officer of the Legion of Honor in 1887.

BUSSORA. See **BASSORA**.

BUSSU PALM, *Manicaria saccifera*, a South American palm, growing in the tidal swamps of the Amazon, the only known species of its genus. The stem is only 10 to 15 ft. high, curved or crooked, and deeply ringed. The leaves are simple or undivided, and are the largest of the kind produced by any known palm, being often 30 ft. long, and 4 or 5 ft. wide. They are simply branched, drooping, and the fruit is of an olive color, large, hard, and three-seeded. The leaves make excellent and durable thatch, being split down the midrib, and laid obliquely on the rafters, so that the furrows formed by the veins lie in a nearly vertical direction, and serve as so many little gutters to carry off the water. The spathe, taken off entire, is used by the Indians as a bag, or the larger ones are stretched out to make caps.

BUSSY-RABUTIN, **ROGER**, Count de, a French writer and soldier, 1618–1693; distinguished himself for his valor during the Fronde, and as the author of spirited ballads and epigrams. His best known work is entitled *Histoire amoureuse des Gaules*, 1665, in which he handled in a very free manner the amorous adventures of several ladies of the court. The work got him into trouble and he was thrown into the Bastille, but was released after a year and banished to his estates in Burgundy. The book has been many times republished and has been widely read. Besides this, he wrote many poems and fugitive pieces, and left two volumes of interesting memoirs, published in 1696, and a collection of letters published in 1697–1709.

BUST (Ital. *busto*; Fr. *buste*), in plastic art, the name given to a sculptural representation of the head and upper part of the human body. The earliest busts formed by the ancients were probably those heads of Mercury which, when elevated on tall square blocks of stone, received the name of *hermæ* (see **HERMES**). These were afterwards frequently surmounted by representations of other divinities, such as Minerva; and as they gradually assumed more and more of the human form, they passed into busts, which were made of marble, bronze, etc. But it was not till very late in the history of art that busts, in the sense of portraits of individuals, came to be used, either in Greece or Rome; and it is remarkable that neither Greeks nor Romans designated them by any special name, for the Latin word *bustum* had a quite different meaning. It was not till Alexander's time that busts were used for purposes of portraiture in Greece; and most of the Roman busts which we possess belong to the period of the emperors. During the learned period of Greece, which commenced with Aristotle, portraits of men of letters formed an important department of art; and it became an object with the founders of museums and libraries to procure complete sets of them. The artists of this period exhibited remarkable ability in expressing the characters of the individuals whom they represented. In this way we have well-authenticated busts of Socrates, Plato, Zeno the Stoic, and other philosophers; of poets and orators, such as Isocrates and Demosthenes; of Athenian statesmen and distinguished women. In Rome, representations of the kings, and persons of distinction belonging to the earlier period, were probably made from the *imagines majorum* which every patrician preserved in his atrium, and which were commonly made of wax. These, no doubt, were often merely fanciful representations, partly taken, it may be, from the more prominent features which belonged to the existing members of the family. The earliest well-authenticated Roman B. which we possess, is probably that of Scipio Africanus the elder. During the empire, busts for the most part were accurate portraits, and still furnish us with the means of becoming acquainted with the features, not only of the emperors themselves, but of most other persons of distinction. Busts of poets and men of letters are far less frequently met with amongst the Romans than amongst the Greeks. The chief marks of the authenticity in these busts

are the names which very frequently are inscribed on them, and, where these are not found, the comparison which we are enabled to make between them and coins. Private collectors of busts were not unknown in antiquity, as, for example, M. Terentius Varro and Pomponius Atticus. In our own time, king Louis I. of Bavaria made, in his celebrated Valhalla, the most remarkable collection of busts which perhaps anywhere exists. The first complete collection of engravings from antique busts was made by Fulvius Ursinius in his *Illustrium Imagines* (Rome, 1569, and Antwerp, 1606). Recently, we have been indebted to Visconti's *Iconographie Grecque* (Paris, 1811) and *Iconographie Romaine* (Paris, 1817) for a similar collection.

BUSTAMENTE, ANASTASIO, 1780-1851; a physician; b. Tiquilpan, Mexico. He was among the earliest supporters of Iturbide when the revolt against Spain began in 1821. In 1830, he became vice-president of the republic, exercising the full power of president. He resigned when Santa Anna's revolution of 1832 became successful, and the next year was exiled, living in Europe until 1836, but recalled after the downfall of Santa Anna, and in 1837 elected president. In 1841 he resigned the presidency to Santa Anna, and in 1846 he was president of the Mexican congress.

BUSTARD, *Otis*, a genus of birds, sometimes made the type of a family, *otidae*, usually ranked in the order *grallæ* (q.v.). The general structure seems to agree best with that of the *grallæ*; but there are points of strong resemblance to gallinaceous birds, both in the appearance and habits of the bustards; while their power of running, and the use which they make of their wings to aid in running, are indicative of a relation to the *struthionideæ*, or ostrich tribe. They differ, however, from these birds in possessing wings quite capable of flight, although even when pressed by danger they often seek to escape by running, and the great B. of Europe has been pursued and taken by greyhounds.—Bustards are birds of bulky form, with long neck and long naked legs; the toes, three in number, all directed forward, short, united at the base, and edged with membrane; the wings rather rounded; the bill of moderate length, straight, or nearly so. They are mostly inhabitants of open plains, to which all their habits are adapted.—The GREAT B. (*otis tarda*) was at one time plentiful in some parts of England, and was also an inhabitant of the s.e. of Scotland; but extending cultivation, and the persecution to which it has been subjected, have now rendered it a very rare British bird. It is common in the s. and e. of Europe, and abounds in the wide steppes of Tartary. It is the largest of European birds, the male sometimes weighing nearly 30 pounds. The female is much smaller than the male. The plumage is of a pale chestnut color on the upper parts, beautifully varied with black—much white and black on the wings, the tail tipped with white. The tail is short, spreading, and rounded. A tuft or plume about 7 in. long, springing from the chin, passes backwards and downwards on each side, in the summer dress of the male, partly concealing a long stripe of bare skin on each side of the neck. The anatomy of the male exhibits a remarkable peculiarity in a large bag or pouch, capable of holding several pints, the entrance to which is between the underside of the tongue and the lower mandible. The use of this bag is unknown; but it has been conjectured to be for conveying water to the females and young, in wide, arid plains. The great B. feeds indiscriminately on animal and vegetable food, swallows frogs, mice, worms, etc., and is very fond of turnip-tops. Its flesh is highly esteemed for its flavor. It is polygamous. No difficulty is found in taming it, but all attempts to reduce it to a state of true domestication have hitherto failed, from its not breeding in the poultry-yard.—The LITTLE B. (*O. tetraz*), frequently in the s. of Europe and n. of Africa, is only an accidental visitant in Britain. It is not half the size of the great B.—The BLACK-HEADED B. (*O. nigriceps*) is found in large flocks in the open plains of the Mahratta country. Its flesh is esteemed one of the greatest delicacies in India.

BUSTO-ARSI ZIO, a t. of northern Italy, in the province of Milan, and 20 m. n.w. from Milan. It stands in a fertile plain, which produces much wine. Pop. about 9000.

BUTADES (wrongly called Dibutades), a Greek modeler in clay, described as the first who copied the human face in that material. Seeing on a wall a drawing in outline of his daughter's lover, B. molded the face of it in clay, and baked it with the tiles which it was his business to make. The incident led B. to ornament the ends of roof-tiles with faces, a practice largely imitated in after years. He lived about 600 B.C.

BUTCHER-BIRD. See SHRIKE.

BUTCHER, SAMUEL, D.D., 1811-76; ninetyeth bishop of Meath, Ireland; educated at Trinity college, Dublin, where he held professorships in ecclesiastical history and divinity. He was a prominent controversialist. His best known works are: *On the Present State of the Romish Controversy in Ireland*, 1855; *On the Relative Value of Human and Divine Knowledge*, 1857; *On the Conservative Character of the English Reformation*, 1862; and *Some Thoughts on the Supreme Authority of the Scriptures*, 1864.

BUTCHER, SAMUEL HENRY, LL.D., a British classicist born at Dublin (1850), educated at Marlborough College, Fellow of Trinity College, Cambridge (1874-76), Fellow of University College, Oxford (1876-82), and Professor of Greek at the University of Edinburgh

(1882). With Andrew Lang he has translated the *Odyssey* (1879) and written an account of Demosthenes (1881).

BUTCHERS' BROOM, *Ruscus*, a genus of plants of the natural order *liliaceae*, with male and female flowers on separate plants, a perianth of six leaves, filaments united, one style, and the fruit a berry. The common butchers'-broom (*R. aculeatus*) is a shrubby or almost shrubby evergreen plant, with a biennial stem, 1 to 3 ft. high, sending out many short branches and ovate alternate sharp-pointed false leaves of the same substance as the branches, the flowers minute and arising from the disk of the false leaves, solitary; the berries red, almost as large as wild-cherries, and of a sweetish taste. It is common in many parts of the s. of Europe, and in the s. of England in woods and hedges. The English name is derived from the use made of the plant by butchers, to sweep their blocks. It grows well under trees or shrubs, and can often be advantageously introduced for ornamental purposes. The root was formerly much used in medicine. It is aperient and diuretic.—*R. hypophyllum*, a native of Italy, had once a considerable reputation as a stimulant of the uterus.

BUTE, an island in the firth of Clyde, Scotland, separated from the coast of Argyle by a narrow winding strait, called the kyles of Bute, mostly under a mile wide, about 6 m. distant from the w. coast of Ayrshire, and 8 m. n. of Arran. It is about 16 m. long, of irregular breadth, and with an area of 60 sq. miles. The surface to the n. is high, rugged, and barren; in the center and s., it is low and undulating, and comparatively fertile. The highest point rises 875 feet. The coast is rocky and has some bays. The island has several small lakes. The climate is milder than in any other part of Scotland, and, though moist, less so than on the w. coast generally; hence, it is much resorted to by invalids. In the s. the soil is sandy; towards the n. clay predominates. Most of the land is under tillage, and agriculture is in a good state. The chief town is Rothesay. Most of the island belongs to the marquis of Bute, whose beautiful seat, Mount Stuart, is about 4 m. s. from Rothesay. Among the antiquities of B. are Rothesay castle, Kames castle, Kilmorie castle, St. Blaine's chapel, Dungyle, a remarkable vitrified fort on a high crag on the s.w. coast, and the Devil's caldron, a circular erection, the original purpose of which is not well known. B. and the neighboring isles were for many centuries subject to the Norwegians.

BUTE, JOHN PATRICK CRICHTON STUART, Marquis of, b. 1847. He joined the Roman Catholic church in 1868 and has published several religious works, besides various articles for reviews. In 1893 he was elected Rector of St. Andrews University.

BUTE, JOHN STUART, third earl of, was b. in 1713, and d. in 1792. About 1737, he attracted the favorable notice of Frederick, prince of Wales, who made him one of his lords of the bedchamber. After the death of the prince, he became Groom of the Stole to his son, afterwards George III., over whose mind he obtained a strong influence. In Mar., 1761, he was appointed one of the principal secretaries of state; and from the 29th May, 1762, to the 8th April, 1763, he was prime minister. His government is memorable only as one of the most unpopular that ever held office in Britain, its fundamental principle being the supremacy of the royal prerogative, of which the executive government were merely the humble servants. Lord Bute was given to scientific pursuits, especially botany, and showed himself a liberal patron of literature and art. He married the only daughter of lady Mary Wortley Montagu.

BUTEA, a genus of plants of the natural order *leguminosae*, suborder *papilionaceae*, remarkable for the great length of the *standard* of the flower, and having a compressed, one-seeded pod, membranaceous at the apex. The best known species are *B. frondosa* and *B. superba*, natives of India; and the former very widely diffused throughout that country, generally appearing as a sort of shrub in the neighborhood of villages, but in the jungles growing into a small tree. These trees present a gorgeous sight when covered with racemes of large deep scarlet flowers. They have trifoliate leaves, with roundish leaflets, velvety beneath. They yield a resinous exudation, which occurs in the form of lurid red tears, often covering the twigs, and is one of the kinds of lac (q. v.) brought to the market in India. The juice of the tree is not red, and the lac is supposed to be elaborated by insects, but of what species is unknown. *B. frondosa* is called the *dhak* tree in India. The bark and roots are very fibrous, and the fiber is used for calking boats. The flowers, called *teesoo* or *keesoo*, yield a beautiful yellow or orange dye.

BUTERA, a t. of Sicily, in the province of Caltanissetta, and 8 m. n.n.w. from Terranova. It stands on a height on the left bank of the Manfria. Ruins of great antiquity exist in the neighborhood, but the ancient name is unknown. In 853, B. was besieged for five months by the Saracens, who raised the siege on the surrender of 6000 persons as slaves. B. was almost the last town in Sicily taken by the Normans, having held out against Count Roger till 1089. The present castle is of Norman erection, and contains a number of mediæval antiquities. Pop. 6000.

BUTESHIRE, a county in the s.w. of Scotland, comprising the isles of Bute (q.v.) and Arran (q.v.), and the Cumbræ, Holy isle, Pladda, Inchmarnoch, and other smaller islands. The area of the whole, according to the ordinance survey, is 225 sq.m., or 143,977 statute acres. The pop. in 1891 was 18,408. B. returns one member to parliament. The county town is Rothesay, in the island of Bute.

BUTIN, ULYSSE LOUIS AUGUSTE, 1838-83; b. Saint-Quentin, France; artist, pupil of Picot and Pils; worked very successfully with charcoal; painter of "The Departure" and "La Pêche," in Salon of 1877; also painter of "Saturday at Villerville—the Waiting," and many others. B. received medals in 1875 and 1878.

BUTLER, a co. in s. Alabama; 782 sq. m.; pop. '90, 21,641, includ. colored; hilly, and mostly covered with pine woods; produces corn, cotton, etc. The Louisville and Nashville railroad passes through. Co. seat, Greenville.

BUTLER, a co. in n.e. Iowa, on Cedar river and the Chicago Great Western railroad; 576 sq. m.; pop. '90, 15,463; an agricultural region, mostly prairie. Co. seat, Allison.

BUTLER, a co. in s. Kansas, on the White and Walnut rivers; 1428 sq. m.; pop. '90, 24,055. Agriculture is the chief business. Co. seat, Eldorado.

BUTLER, a co. in s.w. Kentucky, on Green river; 452 sq. m.; pop. '90, 13,956, incl. colored. Surface uneven, with moderately fertile soil; agriculture the main business. Co. seat, Morgantown.

BUTLER, a co. in s.e. Missouri, on the Arkansas border, w. of St. Francis river; 716 sq. m.; pop. '90, 9964, incl. colored. It has a level surface and fruitful soil, producing corn, tobacco, etc. Co. seat, Poplar Bluff.

BUTLER, a co. in e. Nebraska, s. of Platte river; 583 sq. m.; pop. '76, 4730; in '90, 15,454; productions agricultural. Co. seat, David City.

BUTLER, a co. in s.w. Ohio, on the Indiana border, intersected by Miami river, the Miami canal, and three railroads; 475 sq. m.; pop. '90, 48,597. Productions agricultural. Co. seat, Hamilton. There are in the co. many interesting monuments of aboriginal inhabitants.

BUTLER, a co. in w. Pennsylvania, near the Alleghany river, drained by the waters of the Beaver; 795 sq. m.; pop. '90, 55,339. The surface is diversified, and the soil sandy but tolerably good, producing the usual crops. Coal, iron, and limestone are plentiful. Co. seat, Butler.

BUTLER, a borough and co. seat of Butler co., Pa., on Conequenessing creek, 31 miles n. of Pittsburgh, and entered by the Pennsylvania, the Pittsburg and Western, and the Pittsburg, Shenango and Lake Erie railroads. Its location in the oil region of the state gives it importance, and coal is mined here. There are several newspapers, glass-works, natural gas, flour-mills, manufactures of woollens and carriages, public high school, and national bank. Pop. 1880, 3163; 1890, 8734.

BUTLER, ALBAN; an English hagiologist, 1710-73. He was educated at the Douay Roman Catholic college, where he was professor of philosophy, and afterwards of divinity. He traveled on the continent, was chaplain to the duke of Norfolk, and president of the English college at St. Omer's, where he died. The *Lives of the Saints* was his great work. It has passed through many editions.

BUTLER, ANDREW PICKENS, 1796-1857; a graduate of South Carolina college, and lawyer of South Carolina. He was in the legislature in 1824, and in 1833 was appointed judge of sessions and afterwards of the supreme court. In 1846, he was chosen U. S. senator. It was Mr. Sumner's reply to B.'s last speech in the senate that led to the assault upon the Massachusetts senator by Preston S. Brooks.

BUTLER, BENJAMIN FRANKLIN, 1795-1858; a native of New York, and law partner of Martin Van Buren. He served in the legislature, and was a member of the commission to revise the statutes. In Jackson's cabinet he was attorney-general, 1833-38, and acting secretary of war, 1836-37. He was afterwards professor of law in the university of New York. He was a leading member of the Democratic party up to the time of the passage of the Kansas-Nebraska bill, after which he acted with the other party. See Mackenzie's *Life and Opinions of B. F. Butler*.

BUTLER, BENJAMIN FRANKLIN, lawyer, general, congressman, and governor of Massachusetts; was born at Deerfield, N. H., Nov. 5, 1818. His father, Captain John Butler, who had commanded a company of dragoons during the war of 1812, and had served under Gen. Jackson, died soon after his son's birth, and Mrs. Butler removed to Lowell, Mass. Benjamin Butler, after the usual schooling of the New England boy, entered Waterville College, Me., where he graduated in 1838. In 1840 he was admitted to the bar, at Lowell, and rapidly acquired a large practice in Lowell and other cities. He was early in politics as a member of the Democratic party, and by them was chosen to the legislature in 1853. In the same year he was a member of the constitutional convention, and in 1859 was elected to the state senate. On the first call for troops in the civil conflict (April 15, 1861), B., who was a brig. gen. of militia, called out his brigade. On the next day, the 6th regiment left Boston; and on the 18th, B., at the

head of the 8th regiment started for Washington by way of Baltimore. Two regiments of his brigade had in the mean time sailed for fortress Monroe, of which they took possession. The burning of railroad bridges prevented B. from reaching Washington directly, and he took possession of Annapolis and repaired the railroad from that city to Washington so speedily, that the 7th New York and the 8th Massachusetts regiments reached the capital in season to prevent any attempt at seizure. In May he took possession of Baltimore without opposition, and the same month was appointed maj.gen. and given command of fortress Monroe. Here he made the declaration, when requested to return runaway negroes, that the slaves were "contraband of war"—a doctrine that greatly discouraged the confederates and correspondingly elated the union side, for up to that period there had been no hesitation on the part of the civil or military authorities in doing their utmost to arrest and return fugitive slaves. In the spring of 1862 he commanded the land force of 18,000 men designed to co-operate with Farragut in command of the fleet to operate in the lower Mississippi, and on the 1st of May he took possession of New Orleans, where he remained until relieved by Gen. Banks, in December. His administration in New Orleans was violently denounced; but he kept order, forced the people to keep reasonably clean streets, and so avoided the yellow-fever for one season; compelled the rich confederates to contribute to the support of those whom the conflict had reduced to want, and enforced due respect for the flag of the nation. Near the close of 1863 he was put in command of the department of Virginia and North Carolina, and in May, 1864, occupied City Point and Bermuda Hundred in support of Grant's movement upon Petersburg. In October he was sent to New York to assure peace during the election, there being danger of serious trouble. In 1864 he was sent against Fort Fisher, but the enterprise failed, in consequence of a storm, and he returned, contrary to orders, for which he was relieved from command. In 1866 he was chosen member of congress from the Boston district, and in 1868, was one of the managers in the impeachment of President Johnson. From the breaking out of the civil war until 1876-77, Butler acted with the Republican party; but when the greenback and labor movement began to take shape he favored it, and in 1878 was the candidate of those parties, and of a large portion of the Democratic party, for governor of Massachusetts, receiving 109,435 votes to 134,725 for the successful Republican candidate. He was an unsuccessful candidate of "greenbackers," labor men, and Democrats, in 1879, formally announced himself a Democrat in the presidential campaign of 1880, and in 1882 was elected by that party gov. of Mass. He was one of the delegates to the Democratic national convention that nominated Grover Cleveland for the presidency, 1884; and was himself a candidate for the nomination. Professing dissatisfaction with the methods and result of that convention, he accepted the nominations tendered him by both the Anti-Monopoly and Greenback-Labor parties, which he united under the name of the People's party, and carried on a vigorous campaign, but polled a far smaller vote than was anticipated. Gen. Butler died suddenly on the 11th of January, 1893. See Parton, *General Butler in New Orleans* (1863); and *Butler's Book* (1892).

BUTLER, CHARLES, 1750-1832; a prolific English writer, nephew of Alban. He was educated at Douay, and entered at Lincoln inn in 1775, coming to the bar in 1791. His literary activity was enormous. Among his works were *Reminiscences*; *Horæ Biblicæ*; *Horæ Juridicæ Subsecivæ*; *Book of the Roman Catholic Church*; and lives of Erasmus, Grotius, and others. He also edited his uncle's *Lives of the Saints*, and completed an edition of *Coke upon Littleton*.

BUTLER, CLEMENT MOORE, D.D., b. N. Y., 1810-90; a Protestant Episcopal minister in Georgetown, D. C., Boston, and Washington; rector of Grace Church, Rome, Italy, 1862-64; professor of ecclesiastical history in the divinity school of the Protestant Episcopal church in West Philadelphia 1864-84. He published *The Book of Common Prayer Interpreted by its History*; *Old Truths and New Errors*; *St. Paul in Rome*; *Inner Rome*; *Manual of Ecclesiastical History from the 1st to the 18th Century*; *Sermons*, etc.

BUTLER, ELIZABETH SOUTHERDEN. See THOMPSON, ELIZABETH.

BUTLER, JAMES. See ORMOND.

BUTLER, JAMES GLENTWORTH, Presbyterian divine, b. in Brooklyn, N. Y., 1821, studied at Yale University and at Union and Yale Theological Seminaries. He is the author of an important commentary called *The Bible Work* (vol. I., 1878; vols. VII. and VIII., 1893) and of *The Fourfold Gospels* (1890).

BUTLER, JOHN, a native of Conn.: d. Canada, 1794: a tory leader in the revolution, commanding a regiment of militia. In 1776 he organized a band of guerillas disguised as Indians, who committed many outrages. He also commanded the men who destroyed Wyoming, Penn., 1778. After peace he settled in Canada, where he was agent for Indian affairs.

BUTLER, JOSEPH, one of the most eminent of English divines, was b. in 1692 at Wantage, in Berkshire, where his father kept a shop. With a view to the ministry of the Presbyterian church, he attended a dissenting academy at Tewkesbury, in Gloucestershire. At the age of 22, he gave proof of high metaphysical ability in a letter to Dr. Samuel Clarke, usually appended to that celebrated writer's *a-priori* demonstration, to which it offers some objections. About this time, he made up his mind to join the church of England, and in Mar., 1714, entered Oriel college, Oxford. Soon after, he

took orders. In 1718, he was appointed preacher at the Rolls chapel, where he preached those remarkable sermons which he published in 1726. The first three, *On Human Nature*, constitute one of the most important contributions ever made to moral science. The scope of the reasoning is briefly, that virtue is consonant with, and vice a violation of, man's nature. In 1725, B. was presented to the rich benefice of Stanhope, in the co. of Durham, to which he removed in the following year. Here he resided in great retirement till 1733. His friend Secker, the archbishop, desired to see him promoted to some more important position, and mentioned his name once to queen Caroline. The queen thought he had been dead, and asked archbishop Blackburne if it were not so. "No, madam," said the archbishop; "but he is buried." In 1733, B. became chaplain to his friend lord chancellor Talbot, and at the same time a prebendary of Rochester. In 1736, he published the great work of which the germs were contained in his three sermons, and which has entitled him, in the eyes of his eloquent disciple Chalmers, to be called "the Bacon of theology." The leading aim of the *Analogy* is to show, that all the objections to revealed religion are equally applicable to the whole constitution of nature, and that the general analogy between the principles of divine government, as revealed in the Scriptures, and those manifested in the course of nature, warrants the conclusion that they have one Author. Soon after the publication of this work, B. was appointed clerk of the closet to the queen, who greatly prized his conversation. In 1738, he was made bishop of Bristol; in 1740, dean of St. Paul's; and in 1750, he was translated to the see of Durham. He lived only to make one visitation of his diocese. His "charge" on the occasion, in which he pointed out, with characteristic depth of insight, the importance of a due maintenance of the externals of religion, as a means of keeping alive the thought of it in the minds of the people, subjected him to much censure as betraying a tendency to Roman Catholicism—a charge unworthy now of serious notice. B.'s private character was such as became a Christian prelate: grave and judicious, he was at the same time meek and generous. His intercourse with his clergy and people was frank and humane; his episcopal treasures were wisely and munificently distributed, as not his own; and no anxious legatee looked with hope to his death. That event took place at Bath, June 16, 1752, and the good bishop's remains were buried in Bristol cathedral. His works, with *Life* by Kippis, and notes by Halifax, were collected and published at Edinburgh (1804); reprinted at Oxford (1807), and subsequently. There are good separate editions of the *Analogy* and of the *Three Sermons*. See *Life* by Bartlett (1839).

BUTLER, NICHOLAS MURRAY, educator, was born in Elizabeth, N. J., 1862. In 1882 he graduated with honors from Columbia College, receiving at once a fellowship. After spending some time abroad in study at Berlin and Paris, he returned to this country, becoming successively, at Columbia, assistant in philosophy, tutor (1886-89), adjunct professor (1889), and professor of philosophy (1890), succeeding Prof. Archibald Alexander. On the organization of Columbia as a university in 1890, Dr. Butler was elected Dean of the Faculty of Philosophy. He has also been President of the New Jersey Council of Education (1889), educational representative of New Jersey at the Paris Exposition (1889), President of the N. Y. College for the Training of Teachers (1887-91), and editor-in-chief of the *Educational Review* (1891). Dr. Butler is the author of a great many addresses, papers, essays, and reviews. In 1894 he was elected President of the National Educational Association.

BUTLER, SAMUEL, poet, was b. at Strensham, Worcestershire, in 1612. His father was a farmer in that place, and said to be a person of some education. Young B., after acquiring the rudiments of his education at home, was placed at the college school at Worcester. His progress there was rapid, and on leaving it he proceeded to one of the universities. After finishing his education, he was appointed clerk to T. Jeffreys, esq., justice of the peace, and in his leisure hours devoted himself to the study of music and poetry. He afterwards entered the household of the countess of Kent, which he left, and went to live with sir Samuel Luke, who resided in the same county. After the king's restoration, he was made secretary to the earl of Carberry, which office he held till 1661. About this time, B. married a Mrs. Herbert, a lady of good family and some property, which, however, was afterwards lost by being invested in bad securities. He published the first part of *Hudibras* in 1663, and its reception at court was immediate and triumphant. It received all the favor Charles could spare from his spaniels and his mistresses, and he deigned even to garnish his royal conversation with its wit. The courtiers took up the fashion, the coffee-houses and taverns followed suit, and finally the mob went into raptures, in imitation of its betters. *Hudibras* was pirated within four weeks of its publication. The king had wit enough to see the merit of the work, but he lacked generosity to relieve the necessities of the writer. There seems to be no good reason to believe that B.'s palm ever tingled to the touch of royal pension or gratitude. Poverty is almost the only thing in B.'s life that one is certain of. In 1664, he published the second part of his book, and a third part appeared in 1678. He died in Rose street, Covent garden, in 1680; and while some say that he starved from pride, all agree that at his death he was very poor.

Hudibras is a kind of metrical *Don Quixote*; and if the work of Cervantes stands at the head of its class in the literature of Spain, *Hudibras* occupies the same place in the literature of England. The Puritans are the subjects of B.'s derision, and king Charles must have felt that the poet avenged for him the battle of Worcester. The weight, compression, and plenteousness of the wit is wonderful. *Hudibras* is like a mass of crystals, every point flashes. It is, beyond any other book, of wit "all com-

pact." B. thinks in witty couplets, he argues in them, he spears his foes with a jest, he routs and chases them into oblivion with unextinguishable laughter. His best things have become proverbs. His mass of wit has been grated down into common speech, and particles may be found in the talk of English plowmen and artisans.

BUTLER, WILLIAM ALLEN, LL.D.; b. N. Y., 1825; a graduate of the university of New York, studied law with his father (Benjamin F., of New York), and traveled extensively abroad before commencing practice. He is the author of several popular satirical poems, among which are *Nothing to Wear*; *Barnum's Parnassus*; and *Two Millions*. He has also published *Lawyer and Client*, a biographical sketch of Martin Van Buren; *Domesticus* (1886); *Ober-Ammergau*, verse (1891); *Mrs. Limber's Raffle* (1894), etc.

BUTLER, WILLIAM ORLANDO, 1793-1880; b. Ky.; served in the Indian battles of 1812, and under Jackson at New Orleans, and after the war practiced law in Kentucky. He was a member of congress, 1839-43, and next year democratic candidate for governor; in 1848 the democratic nominee for vice-president, but not successful. He served as maj. gen. of volunteers in the war with Mexico, and was wounded at Monterey. He was a member of the peace congress of 1861. See *Life* by F. B. Blair, Jr.

BUTLERAGE OF WINE, as described by Blackstone and Stephen, is a very ancient hereditary duty belonging to the crown, and is otherwise called the *prisage* of wines. Under the right to levy it, the crown could take two tuns of wine from every ship (English or foreign) importing into England 20 tuns or more, one before and one behind the mast; which, by charter of Edward I., was exchanged into a duty of two shillings for every tun imported by merchant strangers, and called butlerage, because paid to the king's butler.

BUTO, an Egyptian goddess, deity of the town Buto in northern Egypt. She personified lower Egypt; and, it was believed, presided over fire, and resided in the sun. B. was considered to represent the Greek Latona, and to be the regent of certain districts and cities in Egypt and Arabia.

BU'TOMUS, a genus of aquatic plants, of which one species, *B. umbellatus*, is frequent in ditches and ponds in many parts of Europe.

BUTT, ISAAC, b. 1813; graduate of Trinity college, Dublin, and a member of the Irish bar. He was one of the counsel for Smith O'Brien and others tried in 1848 for treason, and also for the Fenians tried in 1865. In 1852, he was chosen to parliament from Youghal as a liberal conservative; and in 1871 he was returned from Limerick as a "home ruler," and was for many years the chief leader and support of the idea which that name involves. He was one of the projectors, and for a time the editor, of the *Dublin University Magazine*. He also published *Literature of Political Economy*; *History of the Kingdom of Italy*, and works on the relations of landlord and tenant. He d. in 1879.

BUTTE, a small hill or knoll, or rising ground; in some places applied to mountains, as the Downieville Buttes in California, which are nearly 9000 feet high.

BUTTE, a co. in n. California, on the Sacramento and Feather rivers; 1720 sq. m.; pop. '90, 17,939. The surface is rough and well wooded, and the soil fertile. The co. is rich in gold, silver, platinum, cinnabar, lead, and iron. The Southern Pacific railroad crosses the w. portion. Wheat, barley, wine, and wool are the chief agricultural productions. Co. seat, Chico.

BUTTE, a western co. of S. Dakota, organized 1883; on the northern edge of the Black Hills, and the Fremont, Elkhorn, and Missouri Valley railroad; 2335 sq. m.; pop. '90, 1037. The soil is fertile; the principal industries are farming and stock-raising. Co. seat, Bellefourche.

BUTTE, city and co. seat of Silverbow co., Mont., on the s. slope of the Big Butte range of the Rocky mts., 108 m. s. by w. of Helena, and reached by the Union Pacific, Northern Pacific, Great Northern, Montana Union, and other railroads. It was laid out in 1864, but its prosperity dates from the successful operations in quartz mining in 1875. It is situated at an altitude of 5000 ft., is handsomely laid out, has water-works, cable and motor street-cars, a fire department, excellent schools, newspapers, a public library, and many churches, and is the seat of the great Anaconda mine. Pop. 1880, 3363; 1890, 10,723.

BUTTER (Ger. *Butter*; Fr. *beurre*; Lat. *butyrum*) is the fatty substance present in the milk of the mammalia, and capable of being extracted from it. In ancient times the Hebrews seem to have made copious use of butter as food; but the Greeks and the Romans used it only as an ointment in their baths, and it is probable that the Greeks obtained their knowledge of the substance from the Scythians, Thracians, and Phrygians, whilst the Romans obtained it from Germany. In southern Europe, at the present time, B. is very sparingly used; and in Italy, Spain, Portugal, and southern France, it is sold by apothecaries as a medicinal agent for external application. The amount of B. in cows' milk (q. v.) is about 4 per cent., though the kind of pasture, quantity of milk, and general condition, influence the relative quantity of the several ingredients of milk. In the extraction of B., the milk is allowed to cool, and the cream which rises to the surface is skimmed off, and put into a large, deep, earthenware vessel, where it lies for several days till enough has been collected for a *churning*. Any difference in the exact mode of treatment of the milk yields a B. with some peculiarity or other.

In order to separate B. from milk, recourse is always had to the process of agitation in churns (q.v.). The principle involved in each and all forms of this apparatus is the thorough agitation of the contents, so as to cause the rupture of the minute fat globules present in the milk, and the incorporation of these ruptured fat globules into larger or smaller masses of butter. The cream is strained through cloth into the churn, to remove any foreign matter; and the agitators being set in motion, the friction of the movement, combined with the admission of air, and the chemical changes it induces, raises the temperature of the whole contents. At one time, it was thought that one great object of the agitation was the admission of the oxygen of the air, which becoming thoroughly incorporated with constituents of the milk, combined therewith, and, as a consequence, led to the separation of the butter. It is found, however, that B. can be obtained from milk by mere agitation, without the admission of the oxygen of the air. At the same time, in the ordinary way of churning, oxygen does play a subordinate part by combining with the sugar of the milk, and forming lactic acid, which in its turn *sours* the milk, and separates therefrom the casein (q.v.)—cheese-matter—in minute clots or flakes, yielding what is commonly called *sour* or *butter-milk*. The process of churning must be conducted at a medium rate. If too quickly performed the B. is soft and frothy, and is said to *burst*; whilst when too slowly made, it is highly tenacious, strong tasted, and badly flavored. When all the B. has *come*, which is known by the particles agglutinating into irregular masses, the B. is *made* by taking the lumps, and well washing and kneading them on a wooden board in a tub of pure spring-water till all the butter-milk has been expressed; it is then divided into the requisite size of lumps, fashioned into rolls, or molded into forms, and usually stamped with some device. In the making up of the B. the hands of the operator must be scrupulously clean, and be free from the slightest taint of soap. Persons who are subject to moist hands should never knead B., as it is very liable to be contaminated by the slightest foreign matter, especially animal secretions; and it is better always for the operator to wash the hands with water containing some oatmeal before commencing. So important is this source of contamination regarded in America, that every endeavor is made to get quit of manual labor in working the B., and a wooden *butter-worker* has been invented, and is largely used here. When newly prepared, the B. is called *fresh* or *sweet* B., and is of a yellow color, which is well known to be deeper as the pasture on which the cows have been fed is richer, and hence the poorer kinds of B. are often artificially colored with annatto (q.v.).

A large quantity of the B. sent into market has more or less common salt added, for the purpose of preserving it. For use within a week or two, the proportion of common salt employed is about $\frac{1}{4}$ an oz. to 2 lbs. of B., though, where it has to be kept for some time, as much as 1 oz. of salt to 1 lb. of butter is used. The incorporation requires to be carefully and dexterously done, so that the resulting material may be uniform; and the better plan is to add only a portion of the salt at a time, and to knead and re-knead the B. till the whole is thoroughly mixed. When the less amount of salt has been employed, the result is *powdered* B., and the larger quantity yields *salt* butter. Much of the latter is closely packed in small wooden firkins or *kits*, and occasionally in stoneware, and sent into market. Great care must be taken to have these kits, and indeed to have every vessel used in the preparation, as clean or *sweet* as possible. Constant rinsings with cold water, and scaldings with boiling water, are resorted to. Attention must likewise be paid to the air of the apartments in which the operations are carried on, as a tainted air is very injurious. See *illus.*, DAIRY, vol. IV.

The adulterations liable to be present in B. are an undue proportion of salt and water, and these run up occasionally to upwards of 33 per cent, or one third of the total weight. Another adulteration is the presence of lactate of zinc, derived from the milk being placed in zinc pails and basins, from the impression that by some imaginary electrical influence an increase in the amount of cream will be the result; but though this is not attained, yet the milk tending to form lactic acid, the latter attacks the zinc vessel, and forms lactate of zinc, which dissolves in the milk, and thereby contaminates it, imparting an unpleasant taste, and, when present in larger quantity, leading to violent spasmodic vomiting. When B. is allowed to get old, it becomes rancid and tastes and smells disagreeably. To some extent an acid is formed, called butyric acid (q.v.). For the use of B. in diet, see FOOD and NUTRITION.

BUTTER, in chemistry, is often applied generically to any substance of the same consistence of B., and is therefore used to designate palm, cocoa-nut, shea, and nutmeg oils. It is also applied to certain metallic substances which have an oily aspect and consistence resembling melted B.; thus we have B. of antimony, bismuth, zinc, and tin.—BUTTER of antimony is a thick, dense, oily compound, produced by acting upon the native sulphuret of antimony, SbS₃, by concentrated hydrochloric acid, HCl, and heat, when the oily chloride of antimony, SbCl₃, is formed. See ANTIMONY.

BUTTERINE, or OLEOMARGARINE (q.v.), a substitute for B., was first manufactured in France, but is now extensively produced in other countries, particularly in America. Its sale under the name of Butterine was prohibited in Great Britain in 1887. See DAIRY. It is composed of animal fat, amalgamated with milk, to which is sometimes added a small proportion of real butter.

BUTTER, ROCK, a mineral which may be regarded as a variety of alum (q.v.)—an iron alum, appearing as a pasty exudation from rocks that contain alum or its constituents,

URBANA

particularly alum-slate and other schistose rocks. It occurs at Hurlet alum-work, near Paisley, Scotland, and in a number of places on the continent of Europe. It is not unlike B. in color, varying from yellowish white to sulphur yellow. It is rather greasy to the touch, and is easily broken in pieces.

BUTTERCUP. See *RANUNCULUS*.

BUTTERFIELD, DANIEL, U. S. military officer, b. in 1831, educated at Union College, led a regiment of volunteers at the outbreak of the civil war and took part in many actions, rising to the brevet rank of major-general in the regular army. He resigned in 1869, became sub-treasurer of the U. S. in New York, and afterwards went into the express business.

BUTTERFIELD, JOHN, 1783-1869; one of the founders of the express business in the United States. Before the time of railroads he was proprietor of many important lines of stage coaches, especially in New York state.

BUTTERFISH. See *GUNNEL*.

BUTTERFLY, the common name of all the diurnal lepidopterous insects (see *LEPIDOPTERA*), corresponding with the genus *papilio*, as originally defined by Linnæus, but forming many genera in the most recent entomological systems. Butterflies exhibit a great similarity in almost all respects to other lepidopterous insects, the common characters of which will be found in the article on that order; but are distinguished even more than the rest of them generally, by brilliancy of coloring, which in butterflies also belongs to the under as well as the upper side of the wings, whilst the beauty of moths and hawk-moths appears chiefly on the upper side. Accordant with this circumstance, is the further peculiarity, that almost all butterflies, when at rest, usually hold their wings erect, the under side being thus chiefly exhibited; whilst the other lepidopterous insects, when at rest, hold their wings in a horizontal or somewhat inclined position, and some have them wrapped round the body. Butterflies are also the only lepidopterous insects which have no spines, bristles, or hooks on the margins of their wings, by which the second wing on each side can be attached to the first, but both when flying and at rest, have all their wings quite separate. The manner in which the scales of the wings are imbricated, gives those of butterflies a smoother appearance than those of moths and hawk-moths. The antennæ of butterflies are generally simple, slender, and elongated, and terminated by a little club. Their caterpillars have always sixteen feet (see *CATERPILLAR*). The pupa or chrysalis is angular; is seldom enveloped in a cocoon; is generally suspended by the tail, by means of a silky substance, often to a leaf or twig, but is sometimes supported by bands around the middle; and generally exhibits more or less of that golden coloring from which both the names *aurelia* (Lat. *aurum*) and *chrysalis* (Gr. *chrysos*) are derived.

Butterflies are found in all parts of the world; they are to be seen during the sunshine of the brief summer extracting nectar from the flowers even of Greenland and Spitzbergen, but they are most numerous in the warmest regions; where, however, many of them live chiefly in the shade of moist foliage, in woods and jungles. Dr. Hooker, describing the scenery on the banks of the Great Runjeet in the Sikkin Himalaya, says that "by far the most striking feature consisted in the amazing quantity of superb butterflies, large tropical swallow-tails, black, with scarlet or yellow eyes on their wings. They were seen everywhere, sailing majestically through the still hot air, or fluttering from one scorching rock to another, and especially loving to settle on the damp sand of the river edge, where they sat by thousands, with erect wings, balancing themselves with a rocking motion, as their heavy sails inclined them to one side or the other, resembling a crowded fleet of yachts on a calm day."

Butterflies possess no small power of wing; some of them, indeed, of which the wings are comparatively thin and delicate, are inferior in this respect, and have a sort of zigzag flight; but others soar in the air with a steady and continuous motion. Short-lived as they are all generally believed to be, some of the tropical species perform wonderful migrations; concerning which, however, nothing but the fact is yet well known. "Frequently," says sir James Emerson Tennent in his work on *Ceylon*, "the extraordinary sight presents itself of flights of these delicate creatures, generally of a white or pale yellow hue, apparently miles in breadth, and of such prodigious extension as to occupy hours and even days uninterruptedly in their passage, whence coming no one knows, whither going no one can tell."

The number of species of B. is very great, and the arrangement of them has been found difficult, chiefly upon account of the great similarity in all important respects which prevails among them all. They are divided, however, into two well-marked sections, of which the first is characterized by having only a single pair of spurs or spines on the *tibia* (or fourth joints of the legs), placed at their lower extremity; whilst in the other section, the tibiae of the hinder legs have two pair of spurs, one pair at each extremity. This distinction, seemingly unimportant in itself, is accompanied by other differences. The second section of butterflies may be regarded as forming a sort of connecting link between butterflies and hawk-moths. A few British species belong to it, but the species are generally tropical, and some of them, found in tropical America, are remarkable for their rapidity and power of flight, and for the migrations which they perform, besides being amongst "the most splendid insects in creation," a resplendent green, inimitable by art, relieving the velvet black of their wings, and varying with

every change of light. The beautiful iridescence of the wings of these and many other butterflies is owing to the peculiar position of the scales.

Some groups of butterflies are remarkable for the imperfect development of the first pair of legs, so that they are generally described as having four legs instead of six.

The eggs of butterflies are deposited on the plants, the leaves of which are to supply the food of the caterpillars. In cold and temperate climates, the eggs deposited in autumn are not hatched till the following spring; but it is believed that many species produce several broods in a year, as the eggs in summer may be hatched in a few days. The caterpillars of each species are generally confined to some particular kind of plant, the leaves of which they devour; their ravages are well known, but the excessive increase of their numbers is in part restrained by many enemies, and by none more than by the ichneumons (q. v.) and other insects, which deposit their eggs in them, and the larvæ of which feed on them. An account of the transformations of B. will be given under INSECT.

Butterflies vary in size from less than an inch to almost a foot across the expanded wings. The largest species are tropical. Some of the species are very widely distributed: *Cynthia cardui*, of which the caterpillar feeds on the leaves of thistles, is found not only throughout Europe, but in Egypt, Barbary, Senegal, Cape Colony, Madagascar, China, Java, Australia, Brazil, and North America, being, in fact, one of the most widely distributed of all insects. The geographical limits of other species appear to be very restricted. The diversity of coloring is almost endless, but a prevalence of certain hues, or of certain modes of the disposal of them, is observable throughout large groups. The caterpillars of many species are variously furnished with spines, those of others—some of them American—have long fleshy prominences, horny at the tip, probably intended as means of defense. The hinder wings of many butterflies are curiously prolonged into tail-like appendages, one or more on each wing, which vary in form, being sometimes long and linear, sometimes broad, and widening towards the extremity. These are seen in several American species.

Butterflies are chiefly known to us as objects of admiration and of pleasing contemplation, enhancing the charms of the most delightful weather, and always associated with the most lovely scenes, or—it must be added—as a cause of annoyance and vexation by the ravages of their caterpillar young in our fields and gardens. There is, however, one small species (*euplaea humata*) which affords a supply of food to some of the wretched aborigines of Australia. Butterflies of this species congregate in such vast numbers on the masses of granite in the mountains, that they are collected by simply making smothered fires under the rocks, in the smoke of which they are suffocated. Bushels of them are thus procured, and they are baked by placing them on the heated ground, the down and wings removed, and the bodies made into cakes which resemble lumps of fat. The months of Nov., Dec., and Jan. are quite a season of festivity from the abundance of this food.

Brief notices of a few of the principal kinds of B. will be found in other parts of this work. See CABBAGE BUTTERFLY; for typical form, CAMBERWELL BEAUTY, PURPLE EMPEROR, ETC. See illus., ANTELOPES, ETC., vol. I.; for LARVA, see adjoining illus., fig. 50.

BUTTERFLY FISH. See BLENNY.

BUTTERFLY WEED, or **PLEURISY ROOT**, *Asclepias tuberosa*, see ASCLEPIAS; a plant found in all parts of the United States, and which has obtained a considerable reputation for the medicinal virtues of its root. The root is large, formed of irregular tubers or spindle-shaped branches, externally yellowish brown, internally white, with a somewhat acrid nauseous taste when recent, merely bitter when dried. It yields its properties to boiling water, and is usually administered in the form of a decoction, sometimes in that of a powder. It is diaphoretic and expectorant, and has been found useful in the commencement of pulmonary affections, in rheumatism, and in dysentery.—The stem of the plant is erect and hairy; the flowers orange-yellow.

BUTTERMILK is the form of milk from which the butter or oily matter has been abstracted. See BUTTER. B. contains the caseine, sugar, and salts of ordinary milk, and is only deficient in oily matters. It is therefore nutritious, and is largely used in Ireland and Scotland as an article of food, being very generally partaken of with porridge and with potatoes. It may be drunk *ad libitum*, is a very agreeable, cooling beverage, and is therefore useful in certain febrile and inflammatory conditions.

BUTTERMILK FALLS, in Le Roy, Genesee co., N. Y., on Oatka creek, which falls over a limestone ledge 90 feet high. The same name is given to a cascade in Bog Meadow creek, near West Point, N. Y.

BUTTERNUT, or **WHITE WALNUT**, *Juglans cinerea*, a large, wide-spreading American tree, with nearly smooth bark, and large leaves. The nuts are well-known, and form agreeable food when dried; when taken green and pickled they are prized for the table. Sugar can be made from the sap, but it is much inferior to that made from maple. The timber is useful for coach and cabinet work, posts, rails, and wooden bowls.

BUTTER TREE, a name given to several tropical trees, of different natural orders, the fruits of which yield concrete fixed oils, having the appearance and used for the pur-

poses of butter. The B. trees of India and Africa belong to the genus *bassia* (q.v.) of the natural order *sapotaceæ*; the B. trees of Guiana and Brazil to the genus *caryocarp* (q.v.), of the natural order *rhizophoraceæ*. The oil-palms (q.v.), and the *cocos butyracea* (see *Cocoa Nut*), may also be regarded as B. trees, although not generally receiving that name.

BUTTERWORT, *Pinguicula*, a genus of plants of the natural order *lentibulariaceæ* (q.v.), distinguished by a two-lipped calyx, the upper lip trifid, the lower bifid; a spurred corolla, two-lipped and gaping, the upper lip arched; and a globose germen. The species are small plants with only radical leaves, found in the bogs and marshes of different quarters of the world. Some of them possess much beauty when in flower, particularly *P. grandiflora*, a rare native of the s. of France and of Ireland. The common B. (*P. vulgaris*) is abundant in the northern parts of Britain and of Europe. It has the power of coagulating milk. The Laplanders pour reindeer milk, warm from the animal, upon the leaves of this plant, instantly strain it, and set it aside for two or three days, till it acquires the consistence of cream, and some degree of acidity, when it is with them a favorite article of food. A little of it in this state will produce the same effect on warm reindeer milk which was at first produced by the leaves of the plant. The origin of the English name B. is sometimes referred to the power of coagulating milk, sometimes to the peculiar sliminess of the leaves.

BUTTERWORTH, HEZEKIAH, b. Warren, R. I., 1839; received a common-school education; taught school and edited a local paper in his native town. In 1870 he became assistant editor of the *Youth's Companion*, and has written much for periodicals, besides publishing *The Story of the Hymns* (1875); a number of volumes of travel for children, entitled *Zigzag Journeys*, beginning in 1879; *The Story of the Notable Prayers of Christian History* (1880); *Young Folks' History of America* (1881); *Young Folks' History of Boston* (1881); *Poems for Christmas, Easter, and New Year* (1884); *Songs of History* (1887); *The Log School-House on the Columbia* (1891); *The Boyhood of Lincoln* and *Little Arthur's History of Rome* (1892); *The Boys of Greenway Court* (1893); *The Patriot Schoolmaster* and *The Parson's Miracle* (1894); *The Knight of Liberty* and *In Old New-England* (1895), etc.; also the cantatas *Under the Palms* and *David, the Shepherd Boy*.

BUTTMANN, PHILIPP KARL, one of the most distinguished philologists of modern times, was b. at Frankfort-on-the-Main in 1764, and studied at Göttingen under Heyne. He became, in 1789, assistant in the royal library in Berlin, and rose successively to be secretary and librarian (1811). He held at the same time (1800-8) a professorship in the Joachimsthal gymnasium in Berlin, which he afterwards exchanged for a professorship in the newly founded university of that city. He died 21st June, 1829. B. is best known by his Greek grammars, the *Griech. Grammatik* (Berl. 1792; 21st ed. by his son, Alexander Buttmann, 1863), and an abridgment of it, *Griech. Schulgram.* (14th ed. 1862); both have been translated into English. His *Lexilogus* (translated by Fishlake) and *Ausführliche Griech. Sprachlehre*, or larger Greek grammar, which have gone through several editions, are designed for scholars. In his *Mythologus*, he has collected his essays on the myths of the ancients.

BUTTON. The term B. is applied to the well-known appendages to dress used for fastening or for ornament; and to a sort of oblong latch moving upon a pivot in the middle, used by joiners and cabinet-makers for fastening the lids of boxes, doors of presses, etc. The mass of fused metal found at the bottom of a crucible or cupel, after fusing or assaying, is also technically called a button.

The history of button-making is in many ways a curious one. Dating no further back as a trade of any importance than the reign of Elizabeth, it has undergone several extraordinary changes, produced chiefly by the ever-varying fashions in dress, but also by some simple, though ingenious inventions, as well as by foreign competition. In Great Britain, Birmingham has always been the principal seat of the button manufacture. What has been called the "Augustan age" of button-making in that city included the latter portion of last and the early part of the present century, when even tradesmen wore coats "loaded with innumerable gilt buttons," and when employers on a moderate scale in this manufacture were making incomes of from £2000 to £3000 a year, and their workmen from £2 to £4 per week. Early in the present century, Mr. B. Sanders introduced the cloth-covered button, which initiated the change from those made of metal, and by which he rapidly made a fortune. His son, in 1825, effected the apparently trivial but really ingenious improvement of making it with a canvas tuft instead of a metal shank, by which both the button-holes and the garment itself were less subject to injury. This kind of button had an enormous sale, and is still much used. A further alteration was made on it by Mr. W. Elliott, who patented, in 1837, a mode of covering the button with silk; and in 1841 the linen button was introduced.

Turning now to other materials which have had a great "success" in their day, we find that buttons made of hoof, under the name of "horn buttons," as introduced nearly 40 years ago by Mons. E. Bassot of Paris, were for a good many years most extensively manufactured at Birmingham, and sent to all parts of the world. In hoof buttons the trade is now comparatively insignificant, and the French makers possess the market for what of it remains. Tweed clothing and fabrics in imitation of it have, through the

necessity of matching their various colors, led to the buttons for them being made of a rather uncommon material, namely, vegetable ivory (q.v.). This substance, which is the fruit of a palm, somewhat resembles true ivory, but is rather softer. It can be readily turned in the lathe, and dyed of various colors. More than 1000 tons of it, valued at from £25 to £30 per ton, are weekly consumed in Birmingham in making buttons, and it is also largely used for the same purpose in France, Germany, and the U. S.

What we have hitherto said refers principally to what manufacturers call the *revolutions* of the trade; but there are other important branches which have been less subject to change, chief among these being the so-called "pearl buttons"—that is, buttons made of mother-of-pearl shells. This has long been a leading branch, and employs a greater number hands than any other. Metal buttons, too, although not relatively so important as formerly, have never ceased to form a prominent section of the trade. They are a numerous class, and include all sorts for uniforms, trouser buttons, fancy buttons which are gilt, stamped, chased, or enameled, and many cheap varieties in iron and other metals for export. Numerous kinds of composite buttons are also partly composed of metal. Glass buttons form another interesting branch, carried on to a considerable extent in Birmingham, but more largely in Bohemia and Paris; so also do porcelain buttons, which, although an English invention, are now almost exclusively made in France. Vulcanite buttons have been very extensively made in the United States. As to other materials, a Birmingham manufacturer says it were easy to write out a long list from which buttons have been made, but very difficult to name one from which they have *not* been made.

We shall now describe briefly some of the processes in button-making, beginning with metal buttons. Circular disks, called "blanks," are first cut out of sheet brass or other metal by means of fly-presses, usually worked by girls. The fly-press consists of a vertical iron screw with a triple thread, to which screw is attached a horizontal arm, bending downwards at the end to form a handle. A punch attached to the press rises and falls with the motion of this handle, and rapidly cuts out the blanks. When large quantities of one pattern are required, a self-feeding, self-acting machine is used, which cuts out the blanks in rows at one blow, turning them out at the rate of 2000 gross per day. After being annealed, the blanks are next made convex by a blow from a stamp. The shanks are formed of wire by a separate machine, which cuts off pieces, and bends them into loops of the required form. When these are soldered on, the buttons are dressed on a lathe. They are then gilded and burnished; some, however, are only lathered; and some, though gilt, are finished in a dead or frosted style.—"Shell" buttons are those with a convex face, a flat or convex back, and hollow. These are made of two blanks, that forming the face being larger than the back to which the shank is attached. These blanks are pressed into the required shape by dies worked in the fly-press, and then, by another die, the edge of the larger blank is lapped over the smaller, and thus attached without soldering. Livery and other buttons having a device in strong relief are stamped by a die placed in a stamping-press. See STAMPING OF METALS.

In making covered buttons, a metal blank is punched, and its edge is turned up by a die in a fly-press; then a smaller metal blank is punched with a hole in the middle, and of such size, that, when flat, it shall fit into the upturned edge of the first: this perforated blank, or *collet*, is next pressed into a concave or dish-shaped. Two cloth blanks—the face one of silk, and the other for the tuft of thin canvas—are now punched, one considerably larger than the front metal blank, the other somewhat smaller; the larger cloth blank is laid upon the flat face of the metal blank, which is filled with a disk of mill-board or paper, and its edges turned over; these edges are covered by the smaller cloth, and then the collet laid upon them with its concavity towards the cloth. They are now all pressed together in a sort of die or mold, by which means the collet is flattened and spread out, while the upturned edge of the metal blank is turned forcibly over it, thus securing the collet, and with it the cloth which is strained tightly on the face, and its edges bound between the blank and the collet, so that the whole is firmly held together. The linen-covered button for underclothing, above referred to, is formed of a single brass ring with a groove or canal on one face. Into this the edges of the two round linen blanks are placed, so that when the edges of the groove are pressed firmly down, the button is entirely covered with linen.

Buttons with holes, technically called "four-holes," "three-holes," and "two-holes," when of pearl-shell, wood, bone, or ivory, are cut with a tubular saw, turned separately in a lathe, and drilled. When of metal, the blanks are punched, then stamped in dies to the required form; the holes are punched, and "rymered," to round the sharp edges that would otherwise cut the thread.—Glass buttons are most largely made by taking a rod of glass of any color, softening the end by heat, and pressing it into a mold, each half of which is fixed to one limb of a pair of pincers. The shank is placed into a hole in the mold before the melted glass is inserted.

The manufacture of pearl buttons was introduced into the United States about 1855. The raw material comes from the China seas and enters our ports free. Chinese snail shells command as high a price as 27 cents each. The common lathe is the only machine used, and no improvement in the process of manufacture has as yet been made. In the United States the lathes are operated by steam power, but in Bohemia and elsewhere, the work is done in families and by the poorer classes. The lathe is operated

by the feet and the hands are left free to manipulate the material. In Austria, France, and Germany much of the manufacturing is done by convicts.

About 7000 persons are employed in Birmingham, London, and elsewhere in Great Britain, in the manufacture of buttons, and a large proportion are women. In 1869 (before the war with Germany), about 20,000 persons were employed in France, showing how much more largely the button industry has been developed in that country. Germany is a still greater producer, the cheaper kinds of fancy buttons made in the Rhenish provinces of Prussia, the glass buttons of Bohemia, and the pearl buttons of Vienna being more extensively exported than those of any other country. The largest button manufactories in the United States are at Northampton, Mass., and Waterbury, Conn., New York, and Newark; Philadelphia, Providence, and Lynn, Mass., are also important centres of this industry. Nearly 10,000 persons are employed in the production of buttons in the entire country. The silver filigree buttons worn on dresses in Norway and Iceland, and the Japanese buttons, or *netsukes*, often possess a high degree of artistic excellence.

BUTTON, Sir THOMAS, the successor of sir Henry Hudson in the exploration of the n.e. coast of America. In 1612-13, he was frozen in and wintered on the w. coast of Hudson's bay. The next summer he explored all the coasts of the bay, returning to England in the autumn. He d. in 1634.

BUTTON'S COFFEE HOUSE, in Russell street, Covent Garden, London, was a famous place of assemblage for wits in Addison's time.

BUTTONWOOD. See PLANE.

BUTTRESS (old Eng. *botress*; Fr. *buttée*), a projection for the purpose of giving additional support or strength to a wall. In the classical style, there were no buttresses, their place being, to a certain extent, supplied by pilasters, antæ, etc. The different stages of Gothic architecture are marked by the form of buttresses employed, almost as distinctly as by the form of the arch. The Norman B. was broad, often semicircular, sometimes dieing into the wall at the top, and never projecting from it to any great extent. Early English buttresses project much more boldly, and are considerably narrower, than the Norman. They are frequently broken into stages, which diminish in size as they ascend. In the decorated style, this division into stages is almost invariable, the B. being often supplied with niches terminating in pinnacles, and very highly ornamented with carving, statues, etc. In the perpendicular style, they retain the forms which had been introduced during the decorated period, the ornamentation, of course, being varied to suit the character of the style. **FLYING BUTTRESSES**—i.e., buttresses in the form of a sloping arch, connecting the upper and central portions of an arched structure with the vertical buttresses of the outer walls—were introduced into England at the period of the early English, though they existed on the continent previously, where they continued to be used to a greater extent. They were also very common in Scotland. In England, they are generally called arch-buttresses.

BUTTS, a co. in central Georgia, on the Ockmulgee; 204 sq.m.; pop. '90, 10,565, incl. colored. The surface is uneven, and soil fertile. Productions, corn, cotton, and sweet potatoes. Co. seat, Jackson.

BUTUA ROOT. See CISSAMPELOS.

BUTYRIC ACID may be best obtained by saponifying butter with potash, then adding dilute sulphuric acid till an acid reaction is attained, and distilling about one half of the mixture, adding a little water, and continuing the distillation till the residue is not acid. B. A. may also be obtained by allowing a small quantity of milk-curd to act upon a solution of sugar at a temperature of 77° to 86° F., which excites a peculiar process of fermentation resulting in the formation of butyric acid. Some chalk is added to take up the B. A. whenever produced, and the better proportions to employ are 100 sugar, 8 to 10 fresh curd, and 50 chalk, with sufficient water to make a thin liquid. The butyrate of lime is left in the vessel, and on acting upon that by dilute hydrochloric or sulphuric acid, and redistilling, the free B. A. passes over in vapor, and is condensed. B. A. is a transparent, thin, oily liquid, with a most persistent rancid odor. It is mixable in all proportions in water, alcohol, ether, and oil of vitriol; has the specific gravity 973 (water being 1000), boils at 325.4° F. (163° C.); though it volatilizes at ordinary temperatures, as appears from the rancid odor of its vapor. Its chemical symbol is $C_3H_7 \cdot CO \cdot OH$, and it combines with bases, such as lime, soda, etc., to form salts.

BUTYRIC ETHER, or **PINE-APPLE OIL**, is an exceedingly fragrant oil obtained by distilling butyric acid (or the butyrate of lime), alcohol, and sulphuric acid. The material which passes over is the B. E., and it is generally mixed with alcohol, and sold in commerce as *artificial pine-apple oil*. It possesses the same very pleasant flavor which belongs to pine-apples, and there is little doubt that pine-apples owe their flavor to the presence of natural butyric ether. The artificial variety is now extensively used for flavoring confections, as pine-apple drops, for sophisticating bad rum, and for flavoring custards, ices, and creams, as also an acidulated drink or lemonade named *pine-apple ale*. B. E. alone cannot be used in perfumery for handkerchief use, as, when inhaled in even small quantity, it tends to cause irritation of the air-tubes of the lungs and intense headache, but it is employed as one material in the manufacture of compound perfumes.

It is composed of ordinary alcohol, C_2H_5OH , and butyric acid, $C_3H_7 \cdot CO \cdot OH$, and its strict chemical name and symbol is ethyl butyrate, $C_3H_7 \cdot CO \cdot OC_2H_5$. It is remarkable that a substance possessing such a disagreeable odor as butyric acid (that of rancid butter) should be capable of forming, in part at least, a substance with such a pleasant flavor as artificial pine-apple oil.

BUXAR, a t. of Shahabad, in Bahar, presidency of Bengal, situated on the right bank of the Ganges. It is chiefly remarkable as the scene of a victory gained in 1764 by sir Hector Munro. At the head of 7072 men, of whom only 857 were Europeans, he defeated a native army of 40,000, and captured 133 guns. B. is 62 m. n.e. of Benares, and 398 n.w. of Calcutta.

BUXBAU MIA, a genus of mosses, of which only one species is known, *B. aphylla*, a very rare British plant, remarkable for its apparent want of leaves; the whole plant above ground seeming to consist of a little conical bulb, with minute scales, which are, however, really its leaves.

BUXTON, a t. in Derbyshire, 33 m. n.w. of Derby. It lies 900 ft. above the sea, in a deep valley, surrounded by hills and moors, which have been tastefully planted; the only approach being by a narrow ravine, by which the Wye flows into the Derwent. The new part of the town is much under the level of the old. Five m. to the e. of B. is Chee Tor, a perpendicular limestone rock, rising to a height of between 300 and 400 ft. from the Wye. B. has, for 300 years, been famous for its calcareous springs, tepid (82° F.), and cold (discharging 120 gallons of water per minute), and its chalybeate springs. It is visited annually, from June to October, by 12,000 to 14,000 persons, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. Nearly 5000 strangers can be accommodated at one time. There is an institution, called the Devonshire hospital, containing 100 beds, supported by subscription, where nearly 1000 patients are annually boarded and lodged free of charge. The baths and public walks are numerous. Much of the splendor of B. is due to the dukes of Devonshire, one of whom, in the last century, at the cost of £120,000, erected an immense three-storied pile of buildings of gritstone, called the Crescent, a curve of 200 ft., with wings of 58 feet. It includes several hotels, a library, assembly rooms, etc. Near B. is the Diamond hill, famous for its crystals; and Poole's hole, a stalactitic cavern 560 yards long. The Romans had baths here. Mary Queen of Scots resided for some time at B., when in the custody of the earl of Shrewsbury. B. is approached by railway both from n. and s.; and the baths, which were rebuilt some years ago, are considered among the finest in Europe. The town, which in 1891 had a population of 7424, is rapidly increasing. Several newspapers are published.

BUXTON, JEDEDIAH, 1705-72, an English prodigy of skill in numbers, b. in Elmtou, Derbyshire. Though the son of a schoolmaster and grandson of a vicar, B.'s education was so neglected that he could not write, nor was he at an early period remarkable for knowledge of numbers. He never could tell how his singular power came, or how he used it; but it was observed that when "figuring" his attention was withdrawn from all external objects. He worked out every question by his own methods, without external aid, and without understanding the common rules of arithmetic. He would stride over a piece of land and tell the contents to almost exact measure. In this manner he measured the whole estate of Clinton, some thousands of acres, giving not only the acres but even the square inches. Then for his own amusement, he reduced the whole to square hair-breadths, on the base of 48 hairs to a lineal inch. His memory was such that he could stop in the midst of an abstruse calculation, and a week or even a month later resume it where he had left off. This mania for figures shut him out from all other knowledge, and on returning from church it did not appear that he had brought away a sentence that had been given out. His faculty was tested before the royal society, where he was presented with a gratuity. While in London he was taken to see Richard III., but his only enjoyment was in counting the number of words spoken by Garrick. He would easily count the steps of a company of dancers, but admitted that the sounds given out by a number of musical instruments perplexed him beyond measure.

BUXTON, Sir THOMAS FOWELL, a man of singular earnestness and force of character, belonging to the class termed "philanthropists," was b. in 1786 at Earl's Colne, Essex. The eldest son of a wealthy family, and early deprived of paternal guidance, his youth was distinguished chiefly by a strong development of animal energy, natural enough to a young Englishman whose full stature exceeded 6 ft. 4 inches. At the university of Dublin, his mind at length asserted its claims, and the new consciousness of needing to raise the family fortunes animated him to extraordinary efforts. His preparatory education had been almost thrown away, but at 21 he left the university its most distinguished graduate. In that year he married a sister of the celebrated Mrs. Fry, and entered business as a brewer, with an energy which in due time was crowned with splendid prosperity. His warm religious and moral impulses soon brought him prominently forward as an advocate of philanthropic interests. Prison discipline formed one of the earliest subjects of his efforts. In 1818, he entered parliament as member for Weymouth, which he continued to represent for about 20 years, taking a prominent part in

every debate on such questions as the amelioration of criminal law and of prison discipline, widow-burning and slave emancipation. The latter, in particular, engrossed a large share of his activity for many years, and no man on that side displayed more indomitable zeal and firmness in its advocacy. In 1837, he was rejected by his constituency, and refused ever after to stand for a borough. His philanthropic labors, however, terminated only with his life. In 1840, he received the well-merited distinction of a baronetcy. He died on 19th Feb., 1845. See *Memoirs of Sir T. Fowell B.* (1848).

BUXTORF, JOHANN, a celebrated orientalist, was b. 25th Dec., 1564, at Kamen, in Westphalia; studied at Marburg, Herborn, Basel, and Geneva. After traveling through Germany and Switzerland, he settled at Basel, where he became professor of Hebrew in 1591. He died of the plague, 13th Sept., 1629. In a knowledge of rabbinical literature, he surpassed all his contemporaries. The two works which prove his extensive acquaintance with this recondite branch of theological study, are his *Biblia Hebraica Rabbinica* (Basel, 1618-19), and his *Tiberias seu Commentarius Masorethicus* (Basel, 1620). The most useful of his grammatical works is the *Lexicon Hebraicum et Chaldaicum* (Basel, 1607).

BUXTORF, JOHANN, the son of the former, was b. at Basel, 13th Aug., 1599, and displayed at an early period a decided predilection for the same studies with his father. At five years of age—according to his rather credulous biographers—he could read German, Latin, and Hebrew. To perfect his knowledge of these tongues, he visited Holland, France, and Germany; and in 1630 was appointed to succeed his father in the chair of Hebrew at Basel, where he died 16th Aug., 1664. Besides his *Lexicon Chaldaicum et Syriacum* (Basel, 1622), and a work of Maimonides, entitled *More Nevochim* (Basel, 1629), which is an exposition of obscure passages of the Old Testament, he published from the MSS. of his father a *Lexicon Chaldaicum, Talmudicum, et Rabbinicum* (Basel, 1639), and *Concordantiæ Bibliorum Hebraicorum* (Basel, 1632).

BUX'US. See Box.

BUYING OF PLEAS by lawyers is prohibited by an old Scotch act passed in 1594. It is explained under the English term *champerty*, to which it is analogous.

BUYUKDEREH, or BÖYÜK-DERE, a beautiful suburb of Constantinople, from which it is a few miles distant, situated on the Bosphorus, in the midst of the most charming scenery. It forms the summer residence of many of the Christian ambassadors, some of whom have splendid mansions here.

BUZZARD, *Buteo*, a genus of *accipitres* (q.v.), or birds of prey, of the family *falconidae*, having a rather small and weak bill, which bends from the base, and is not notched, as in falcons. The legs are short and strong, the tarsi covered with scales or with feathers, the toes short, and the claws strong. Buzzards may be regarded as an inferior kind of eagles; they do not possess courage equal to that of eagles and falcons, nor equal strength of bill or claws. They are large birds; the common B. (*B. vulgaris*) measuring almost 4 ft. from tip to tip of its outstretched wings. It is a bird still pretty common in Britain, although much less so than it formerly was. It is subject to variations of plumage; the prevailing color is brown, with a considerable mixture of black on the upper parts, and of white or grayish-white on the under. It is sluggish and inactive, in comparison with many other birds of the same family; is usually slow in its flight, and often sits long on a tree, watching for prey, which, when it perceives, it glides silently into the air, and sweeping rapidly down, seizes it in its claws. This B. is plentiful in all the wooded parts of Europe; it is found also in the n. of Africa, and is known to exist in the western parts of Asia; but it is doubtful how far it extends over that continent, a distinct although very similar species occurring in the Himalaya mountains. The common B. is, however, a North American bird. Tame female buzzards have been known in several instances to exhibit so strong a propensity for incubation, and the rearing of young, at the proper season, that they have hatched hens' eggs and brought up the chickens, although if chickens not of their own hatching were brought within their reach, they devoured them. Meat given to the B. nurse was carefully divided among her nurslings, but they found out by their own instincts the use of grain and other vegetable food.—The rough-legged B. (*B. lagopus*) is very similar to the common B., but is at once distinguished by having the tarsi feathered to the toes, whilst in the common B. they are covered with scales. It is a rarer British bird, yet not of unfrequent occurrence; it is very widely diffused, being found in the old world from Lapland to the cape of Good Hope, and equally common in North America. It is most frequently to be seen in marshy districts, and often skimming over marshes, where it makes prey of frogs.—The red-tailed hawk of North America is a species of B. (*buteo borealis*). It is in very bad repute among American farmers and housewives for its frequent invasion of poultry-yards, from which it has acquired the name of *hen-hawk*.—Several other species of B. appear to be limited to particular parts of the world, as *buteo jackal*—so called from the resemblance of its voice to that of the jackal—to s. Africa, and *B. melanosternon* to Australia. The Australian species has the head, chest, and center of the belly deep black. The honey-buzzards (q.v.) belong to a different genus, although nearly allied to the true buzzards, as are also the harriers (q.v.), of which the most common British species, the marsh harrier, is sometimes called the *moor buzzard*.—Bald B. is the name of the osprey (q.v.). See TURKEY BUZZARD, under VULTURE.

BUZZARD'S BAY, on the s. coast of Massachusetts, about 30 m. long by 7 wide; sheltered from the ocean by the Elizabeth islands and Vineyard sound. In the bay are the harbors of New Bedford, Wareham, Sippican, Fairhaven, and Mattapoiset.

BY-BIDDING, at auctions where the bidder may be employed by the owner, and really bidding to enhance the price, not meaning to purchase. This form is unlawful; but bidding merely to prevent the sale of property below its actual value is not so considered.

BYBLOS, an ancient city of Phenicia, now called Jubeil, situated at the base of the lower range of the Libanus, about half-way between Tripoli and Beyrout. B. was famous as the birthplace of Adonis, or Thammuz, in whose honor a splendid temple was erected, which attracted many worshipers. The name given to the town by the Jews was Gibleh, and its inhabitants the Giblites are noticed in the Scriptures as stone-squarers and caulkers of ships. A wall belonging, apparently, to the era of the crusades, surrounds the town, and the remains of a Roman theater are still visible.—B. was also the name of a town in the Egyptian delta, celebrated for its manufacture of papyrus from the byblus or papyrus plant.

BY-LAWS are the private regulations which are usually made by corporate bodies for the control and government of the corporation. They are binding, unless contrary to the laws of the land, or to the charter, or act of incorporation, or, as it has been decided in England, unless they are manifestly unreasonable. Blackstone tells us that the right of making by-laws was allowed by the law of the twelve tables at Rome; and Mr. Stephen, in his *Commentaries*, states that in the law of England such a right is so much of course, as regards every corporation, that if the charter by which certain persons are incorporated give to a select body, out of their whole number, a power to make by-laws as to certain specified matters, the body at large is nevertheless at liberty to make them with regard to all matters not specified. Every corporation, too, can of course alter or repeal the by-laws which itself has made. By the municipal corporation act, 5 and 6 Will. IV. c. 76, s. 90, borough councils have power to make by-laws for the government of the borough, and for the prevention and suppression of nuisances; such by-laws, however, not to be of force till the expiration of forty days after the same, or a copy shall have been sent to one of the secretaries of state, during which period her majesty, with the advice of her privy council, may either disallow the by-laws, or a part, or enlarge the time within which they shall not come into force. Railway companies are required to lay before the board of trade, certified copies of their by-laws and regulations.

BYLES, MATHER, D.D.; 1706–88; graduated at Harvard, and ordained minister of the Hollis street church, Boston, in 1733. In 1765, he was given the degree of doctor of divinity by the university of Aberdeen. He was a correspondent of Swift and Pope, and published a volume of his own poems. During the revolution he adhered to the English side, and for that reason his connection with his parish was dissolved. In 1777, he was denounced as an enemy to the country, imprisoned for a time, and condemned to exile, but the latter sentence was commuted to confinement in his own house, before which sentinels were placed. His reputation for quick and caustic wit has kept his memory alive.

BYNG, GEORGE, Viscount TORRINGTON, a British admiral, b. Jan. 27, 1663, eldest son of John Byng, esq., of Wrotham, Kent, entered the navy as a volunteer at the age of 15, and rapidly rose to the rank of lieutenant. In 1688, he recommended himself to the prince of Orange by his activity and zeal in attaching the officers of the fleet to the cause of the revolution, and was advanced to the rank of captain. In 1702, he took part in the capturing and burning of the Spanish fleet at Vigo, and in the following year was made Rear-admiral of the Red. The attack on Gibraltar was solely confided to his command and for his gallant conduct at the battle of Malaga he was knighted by queen Anne. In 1708, he became Admiral of the Blue, and commanded a squadron fitted out to oppose an intended invasion of Scotland from France, on the part of the pretender. He pursued the French fleet to the frith of Forth, took one ship, and forced the fleet back to Dunkirk, on which occasion he was presented with the freedom of the city of Edinburgh. On the breaking out of the rebellion of 1715, he was appointed to the command of a squadron in the Downs, and for important services against the French, was created a baronet. In 1718, he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, and gained a victory over the Spanish fleet off Messina. Soon after, he was appointed treasurer of the navy, and rear-admiral of Great Britain. In Jan., 1721, he was sworn one of the privy council, and in Sept. following, created baron Southhill and viscount Torrington. On the revival of the Order of the Bath, in 1725, he was installed one of the knights; and, on the accession of George II., was nominated first lord of the admiralty. He represented Plymouth in parliament from 1706 until 1721. Died Jan. 17, 1733.

BYNG, JOHN, a brave but ill-fated British admiral, fourth son of the preceding, b. in 1704, entered the navy early, served under his father, and, in 1727, became captain. In 1748, he had attained the rank of Admiral of the Red. In 1756, he was appointed to com-

mand a squadron of ten ships of the line in the Mediterranean, destined for the relief of Minorca, at that time blockaded by a French fleet under La Galissoniere. On the 20th May, B. made the signal to engage, which was obeyed by Rear-admiral West with such impetuosity that several of the enemy's ships were driven out of the line; but B. not advancing to his support, the French were allowed to escape, and Minorca was lost. The dissatisfaction in England, on the news arriving, was taken advantage of by the ministry to avert the public odium from their own inefficient measures. B. was tried by a court-martial, and condemned to death, for a breach of the 12th article of war, but recommended to mercy. Sacrificed to the general indignation, he was shot on board the *Monarch*, at Portsmouth, Mar. 14, 1757, meeting his fate with firmness and resignation. In the fleet, he was not popular, being a strict disciplinarian.

BYNKERSHOEK, CORNELIUS VAN, a Dutch juriconsult, was b. at Middelburg, in Zealand, 29th May, 1673. He studied at the university of Franeker, took the degree of doctor in 1694, and immediately after commenced to practice as an advocate of the Hague. In 1703, he was elected by the states-general a member of the supreme court, and, in the exercise of his functions, soon had occasion to observe how defective and vague was the common law of the country. In 1710, with a view to remedy this, he published the first part of his *Observationes Juris Romani*; in 1719, his *Opuscula Varii Argumenti*; and in 1724, he was elevated to the dignity of president of the supreme court. In 1733, appeared the rest of his *Observationes Juris Romani*. B. now began to devote himself earnestly to the study of Dutch and international law, acquiring, of the former in particular, a most extensive and solid knowledge. His great work on this subject is his *Questiones Juris Privati*, which he did not live to finish, and on the other, his *Questiones Juris Publici*. In addition to these, B. collected (from his notes) the decisions and proceedings of the supreme court in his time, under the title *Observationes Trumultuariae*, and besides (what is perhaps his most valuable work) made a digest under the title of *Corpus Juris Hollandici et Zelandici*, of all the laws of his own country, whether statutory, or existing in the decisions of courts, or in the practice of the bar, or in the customs of particular places. He died 16th April, 1743. A complete edition of his works was published by Prof. Vicat, of Geneva, in 1761.

BYRAM RIVER, a small stream, scarcely more than a brook, which is often mentioned as the furthest western boundary of New England, separating the towns of Greenwich, Conn., and Rye, N. Y. Recent surveys have straightened the boundary line, which, however, still begins at the mouth of the river and follows it a short distance. One mile above its entrance into Long Island sound, the stream widens, receives the tide, and is navigable for the smaller class of vessels to the village of Port Chester.

BYRD, WILLIAM, 1674-1744; b. Va., and educated in England, where he became a fellow of the royal society. Returning to America, he was receiver-general of revenue in Virginia, colonial agent, member of the council, and one of the commissioners to fix the North Carolina boundary. He laid out the cities of Richmond and Petersburg in 1733 on his own land. He bought in England the *Records of the Virginia Company* (1619-24).

BYRGIUS, JUSTUS, or, more properly, JOBST BÜRGI, the inventor of various astronomical instruments, was b. 28th Feb., 1552, at Lichtensteig, in the canton of St. Gall, Switzerland. In 1750, he went into the service of the learned landgraf of Hesse, Wilhelm IV. His first work was a celestial globe, the surface of which was plated with silver, and in which the stars were placed according to his own observations. The landgraf sent it to the emperor Rudolf II., who thought it so beautiful that, in 1604, he appointed B. his own mechanician. B. subsequently went to Austria, but returned to Cassel in 1622, where he died in 1633. Many of his reputed discoveries and inventions are questioned, such as those of logarithms and the proportional compasses; but he seems to have hit upon something like both, while it is certain that he was the inventor of a method of resolving spherical triangles.

BYRLAW, Birlaw, or Burlaw, the name given to a sort of popular jurisprudence formerly in use in Scotland, in villages and among husbandmen. Sir John Skene, writing in 1597, when the system was in full force, defines B. as "*leges rusticorum, de re rustica late*—laws made by husbandmen, concerning neighborhood to be kept among themselves."—*Reg. Majest.* lib. iv. c. 39; *De Verb. Signif.* voce Byrlaw. As the B. was enacted by the common consent of the villagers or neighbors, so it was administered by judges chosen by them from their own ranks. These judges were commonly called "byrlaw men," a name which is still applied in some parts of Scotland to an arbiter, oddsman, or umpire. The courts which they held were called "byrlaw courts," and took cognizance of disputes between neighbor and neighbor. B. is supposed to be derived from *boor*, or *bauer*, a countryman.

BYROM, JOHN, 1692-1763; an English poet and miscellaneous writer. *Colin and Phoebe*, his first poetical essay, appeared in the *Spectator*. He was made a member of the royal society; invented and taught a system of short-hand writing; was a person of lively wit, and had a taste for the mystical theology of Böhme.

BYRON, ANNE ISABELLA MILBANKE, 1792-1860; only child of sir Ralph Milbanke, and wife of lord Byron. She married lord Byron Jan. 2, 1815, and separated from him in Feb. of the next year. On the death of lord (properly baron) Scarsdale, she became

baroness of Wentworth, and for several years before her death employed her large income in works of charity. One child was borne by her to Byron, "Ada, sole daughter of my house and heart," who married William, lord King, afterwards earl of Lovelace. See Harriet Beecher Stowe's *Lady Byron Vindicated* (1899).

BYRON, GEORGE GORDON, Lord, a great English poet, was b. in Holles street, London, on the 22d of Jan., 1788. He was the only son of capt. John Byron, of the guards, and Catherine Gordon of Gight, an heiress in Aberdeenshire. Capt. Byron and his wife did not live happily. Domestic peace perished in the conflict of their ungovernable tempers. The husband's habits were profligate in the highest degree, and the wife's fortune was soon squandered in the debauch and at the gambling-table. Separated from her husband, the lady retired to the city of Aberdeen with her little lame boy, whom she passionately loved, her sole income at this time being about £130 per annum. In his 11th year, B. succeeded his grand-uncle, William lord Byron; and mother and son immediately left the north for Newstead abbey, the ancient seat of the family, situated a few miles distant from Nottingham, in the romantic district which Sherwood forest shadowed, and which was once familiar with the bugle of Robin Hood. On succeeding to the title, B. was placed in a private school at Dulwich, and thereafter sent to Harrow. The most remarkable thing about B.'s early years was his extraordinary attachments. Like almost every member of the poetic tribe, he "had a passion for the name of Mary." In his 8th year, in Aberdeenshire, he fell in love with Mary Duff. Margaret Parker, a cousin of his own, and who died early, was his next idol. His strongest passion was, however, for Mary Chaworth. This lady he first met when on a visit to Newstead in 1803, at which date he was in his 15th year. Miss Chaworth's father had been killed in a duel by lord Byron, the grand-uncle of the poet, and marriage would have healed the family feud, and would have joined rich estates. But it was not to be. Miss Chaworth was B.'s senior by two years, and evidently felt little flattered by the worship of the lame Harrow boy. Next year came the parting interview described in *The Dream*, with which every Englishman is familiar now as with a personal experience. In 1805, B. removed to Trinity college, Cambridge; and two years thereafter, his first volume of verse, entitled *Hours of Idleness*, was printed at Newark. The poems therein contained were not absolutely without merit, but they might have been written by any well-educated lad who, in addition to ordinary ability, possessed the slightest touch of poetic sensibility. The volume was fiercely assailed by lord (then Mr.) Brougham in the *Edinburgh Review*, and his sarcasms stung B. into a poet. The satire, *English Bards and Scotch Reviewers*, was written in reply to the article in the *Edinburgh*, and the town was taken by a bout of wit and a mastery of versification unequalled since the days of Pope. In the babble of praise that immediately arose, B. withdrew from England, visited the shores of the Mediterranean, and sojourned in Turkey and Greece. On his return in 1812, he published the first two cantos of *Childe Harold*, with immense success, and was at once enrolled among the great poets of his country. During the next two years, he produced *The Giaour*; *The Bride of Abydos*; *The Corsair*; and *Lara*. While these brilliant pieces were flowing from his pen, he was indulging in all the reveries and excesses of the metropolis. What was noblest in the man revolted at this mode of life, and, in an effort to escape from it, he married Miss Milbanke, daughter of sir Ralph Milbanke, a baronet in the co. of Durham. This union proved singularly infelicitous. It lasted only a year, and during that brief period, money embarrassments, recriminations, and all the miseries incident to an ill-assorted marriage, were of frequent occurrence. After the birth of her child Ada, lady Byron retired to her father's house, and refused to return. This event, from the celebrity of one of the parties, caused considerable excitement in the fashionable world. B. became the subject of all uncharitable tongues. The most popular poet, he was for a space the most unpopular individual in the country. In one of his letters, written from Italy some years later, referring to the slanders current at the time, he thus expresses himself: "I was accused of every monstrous vice by public rumor and private rancor. My name, which had been a knightly or a noble one since my fathers helped to conquer the kingdom for William the Norman, was tainted. I felt that if what was whispered, and muttered, and murmured was true, I was unfit for England; if false, England was unfit for me. I withdrew." The separation from his wife, and the departure from England, mark a stage in B.'s genius. A new element of power had entered into his verse; the reader feels it quite distinctly in the burst of exaltation that opens the third canto of the *Childe*.

Misery and indignation stimulated him to remarkable activity. Six months' stay at Geneva produced the third canto of *Childe Harold* and *The Prisoner of Chillon*. *Manfred* and *The Lament of Tasso* were written in 1817. The next year, he was at Venice, and finished *Childe Harold* there; and, in the gay and witty *Beppo*, made an experiment in the new field which he was afterwards to work so successfully. During the next three years, he produced the first five cantos of *Don Juan*, and a number of dramas of various merit, *Cain* and *Werner* being opposite poles. In 1822, he removed to Pisa, and worked there at *Don Juan*, which poem, with the exception of *The Vision of Judgment*, occupied his pen almost up to the close of his life. Morally, his Italian life was unsatisfactory, and his genius was tainted by his indulgences. At the close of his career, he was visited

by a new inspiration; the sun, so long obscured, shone out gloriously at its setting. In the summer of 1823, he sailed for Greece, to aid the struggle for independence with his influence and money. He arrived at Missolonghi on the 4th of Jan., 1824. There he found nothing but confusion and contending chiefs; but in three months, he succeeded in evoking some kind of order from the turbulent patriotic chaos. His health, however, began to fail. On the 9th of April, he was overtaken by a shower while on horseback, and fever and rheumatism followed. Medical aid was procured, and copious bleeding recommended; but this, B., with characteristic willfulness, opposed. Before death, he sank into a state of lethargy, and those who were near heard him murmuring about his wife, his sister, and his child. After twenty-four hours' insensibility, he expired on the evening of the 19th April, 1824. His body was conveyed to England; and, denied a resting-place in Westminster abbey, it rests in the family vault in the village church of Hucknall, near Newstead.

Lord B. is a remarkable instance of the fluctuations of literary fashion. Elevated to the highest pinnacle of fame in the heyday of his early popularity, he was unduly depressed after his death, when the false romance which he threw around himself and his writings began to wear away; and it is only during the last twenty or thirty years that the proper place has been found for him in the public estimation. He is high, but not the highest. The resources of his intellect were amazing. He gained his first reputation as a depicter of the gloomy and stormful passions. After he wrote *Beppo*, he was surprised to find that he was a humorist; when he reached Greece, he discovered an ability for military organization. When all the school-girls of England fancied their handsome idol with a scowling brow and a curled lip, he was laughing in Italy, and declaring himself to be the most unromantic being in the world. And he was right. Take away all his oriental wrappings, and you discover an honest Englishman, who, above all things, hates cant and humbug. In *Don Juan* and his *Letters* there is a wonderful fund of wit, sarcasm, humor, and knowledge of man. Few men had a clearer eye for fact and reality. His eloquence, pathos, and despair; his *Manfreds* and *Childe Harolds*, were only phases of his mind. Toward the close of his life, he was working toward his real strength, and that lay in wit and the direct representation of human life. If his years had been extended, he would in all likelihood have deserted poetry for prose, gaudy colored fiction for sober fact; and the assertion may be hazarded, that the English novel would have boasted of another and a greater Fielding. The *Life* by Moore (1830) is still the standard. See also the account of his life and work by Prof. Nichol in the "English Men of Letters" series; *Lord Byron jugé par les témoins de sa vie* by the Countess de Guiccioli (1868); *Lady Byron Vindicated*, by Harriet Beecher Stowe (1869), and *The Works of Lord Byron*, edited by W. E. Henley (1897).

BYRON, HENRY JAMES, b. Manchester, England; 1834-84; author of many dramatic works, chiefly in burlesque, that have won popular favor. Among them are *Fra Diavolo*; *Maid and Magpie*; *Babes in the Wood*; and travesties of many of the more popular operas. Of comedies he was author of *War to the Knife*; *A Hundred Thousand Pounds*; *Not Such a Fool as he Looks* (in which he played the hero); *An American Lady*; *Old Sailors*; and *Our Boys*, the last comedy achieving an almost unexampled success.

BYRON, Hon. JOHN, 1723-86; an English admiral and circumnavigator. He was the grandfather of Byron the poet. While young, he accompanied Anson around the world, and in later years experienced so much hard service that he was nicknamed by sailors "Foul-weather Jack." In 1769, he was a governor of Newfoundland, and in 1776 became vice-admiral. In 1778, he was sent with a fleet to watch the movements of Count d'Estaing, who had gone to the assistance of the American colonies then in revolution; and in July of the next year, fought the count off Grenada, but the action was of little importance.

BYRON BAY lies on the n.e. coast of Labrador in North America, its lat. and long. being respectively 54° 40' n., and 57° 30' w.

BYRON ISLAND is situated in the Mulgrave archipelago of the Pacific ocean, its lat. and long. being respectively 1° 18' s., and 177° 20' east.

BYS'SUS, a name given from ancient Greek and Roman times to the bundle of silky filaments by which many lamellibranchiate mollusks—bivalve shells—attach themselves to rocks or other fixed substances. The B. springs from a cavity at the base of the solitary foot of the mollusk, and its filaments, which are capable of being reproduced if destroyed, are secreted by a glandular tissue which occupies a furrow running nearly to the extremity of the foot. They are united together at the base in a common mass, and are often considerably divergent. They are guided to their place by the foot, and expand into a sort of disk at the point of attachment, so as to have a firm hold. A few common mussels in an aquarium readily afford an opportunity of observing the B., particularly when the filaments are attached to the glass sides of the vessel.

BYS'SUS (Gr., a fine flaxen or silky substance), a genus established by Linnæus to include some of the lowest and most obscure forms of vegetation, and defined as having a substance like fine down or velvet, simple or feathered. Botanists sometimes ranked it among *algæ*, sometimes among *fungi*; it has been made the type of a group *byssaceæ*, and placed among lichens. Some have regarded this group as entitled to the rank of

a distinct order, "comprehending the filamentous fungi found in cellars, and similar plants;" but others reject the genus as altogether spurious. Some of the species once included in it have now been satisfactorily shown to be lichens, others to be *confervaceæ*, whilst many appear to be really not distinct vegetable forms, but cryptogamic plants prevented by unfavorable circumstances from proper development. The green incrustations formerly regarded as species of B., have been found to be the primary germination of mosses, often species of *polytrichum* and *tortula*. It cannot be said, however, that the nature of all the vegetable forms which have been referred to the genus B., has yet been satisfactorily ascertained. Some of them are very phosphorescent, and are generally found where some higher form of vegetation is undergoing decay.

BYSTRÖM, JOH. NIKOLAUS, a celebrated sculptor, was b. 18th Dec., 1788, at Philippstadt, in the province of Wermeland, Sweden, and educated under Sergell of Stockholm. In 1809, he obtained the highest prize in the Swedish academy of arts, and in the following year went to Rome, where he executed his first independent work, a "Drunken Bacchante," and sent it home. It was received with great approbation, and B. had to repeat it thrice. In 1815, he returned to Stockholm, and surprised the newly elected crown-prince by exhibiting a colossal statue of himself, which he had finished all but the head in Rome, and had found means to complete quietly in Stockholm. The crown-prince was highly gratified, and commissioned B. to execute colossal statues of Charles X., XI., and XII. After 1838, he resided in Stockholm; but returned to Rome in 1844, and died there Mar. 13, 1848. His chief works are: "A Nymph going into the Bath," a "Reclining Juno suckling the Young Hercules," "Hygieia," a "Pandora combing her Hair," "A Dancing-girl," a statue of Linnæus, and colossal statues of Charles XIII., Gustavus Adolphus, and Charles XIV. B. excels in the delineation of females and children, but his male figures want strength of character; his conceptions are always true to nature, his grouping skillful and pleasant, and his execution is clear and distinct.

BY-TERMS, in the vocabulary of Oxford university, are the Lent, or Hilary, Easter, and Trinity terms, which, in distinction from the first or Michaelmas term (Oct. 10-Dec. 17), are for various reasons less advantageous for joining the university.

BYTTNERIACEÆ, a natural order of exogenous plants, sometimes united with the order *sterculiaceæ* (q.v.), and also closely allied to *malvaceæ* (q.v.), from which it differs, especially in the stamens not being columnar—although more or less united, generally into a cup or tube—also in the anthers being turned inwards, and 2-celled. The species of this order are trees, shrubs, or half-shrubby plants, abounding chiefly in tropical climates, although some are natives of the temperate zones. About 400 have been described. The flowers of many are beautiful. The most important product of the order is COCOA (q.v.). The fruit of *guazuma ulmifolia*, a native of Brazil, is eaten, being filled with a sweet and pleasant mucilage. The young bark of this tree yields, when macerated, a copious mucilage, and is therefore used in Martinique for clarifying sugar, as is that of *kydia calycina* in the northern provinces of India. *Guazuma ulmifolia* was introduced into India, and at one time largely cultivated in the Madras presidency, under the name of bastard cedar, that its foliage and young shoots might be employed as fodder for cattle. Its straight, luxuriant young branches yield a strong fiber. The bark of other species of this order also affords a tough fiber, which is employed for making cordage, particularly that of *microlana* (or *schillera*) *spectabilis* in the regions on the southern base of the Himalaya, *abroma argustum* in various parts of India, *dombeya spectabilis* in Madagascar, and *D. umbellata* in the isle of Bourbon.

BY-TOWN, a t. of Upper Canada, on the Ottawa, which took its name from Col. By of the royal engineers. It is now *Ottawa* (q.v.), the capital of the dominion of Canada.

BYZANT. See BESANTS.

BYZANTINE ART. From the time of Constantine the Great, the emperors of the east arrogated to their imperial city the pre-eminence which, for so long a period, ancient Rome had actually possessed; and, as a necessary consequence of this assumption, Constantinople, or Byzantium, as it still continued sometimes to be called, became the rival of the mother-city in the richness and variety of its artistic monuments. In Rome, and, indeed, in the whole of western Europe, the first effect produced by the influx of the mighty stream of barbarian life, and the consequent dissolution of existing society, was the almost total suppression of artistic effort. It was then that the artists of the west, willing and eager to avail themselves of the invitation held out to them, poured into Constantinople, carrying with them what yet remained of the artistic life of the ancient world. Byzantium was the hearth on which, during the dark period of the middle ages, those feeble sparks of ancient art were kept alive, which served to kindle the new and independent artistic life of the modern world. Not only were the painters and sculptors of Italy indebted to the art of Byzantium for the tradition of that ideal mode of conception to which the term classical is peculiarly applied, but artists in every department derived thence the elements of that technical knowledge without which the embodiment of such conceptions is impossible. This practical acquaintance with the technical rudiments of their respective arts, which could scarcely have been derived from a mere examination of ancient works, was communicated to the fathers of Italian

art by living Byzantines, some of them probably the descendants of those whom barbarian conquests had driven into the east, and whom the conquests of a still more barbarous race now restored to western Europe. It is impossible to doubt that modern art was largely indebted to this circumstance for the marvelous stride which it took immediately after the taking of Constantinople by the Turks. But though its chief value may consist in its having thus transmitted to us the succession of antiquity, B. A. was by no means devoid of original and individual character; and it is only in so far as it possesses this, and not when regarded as a mere conservation of antique types and processes, that it takes rank as a school of art. The characteristic element in B. A. may be described as the earliest artistic recognition and representation to the senses of what was new and peculiar in Christian as opposed to heathen life. To the fullest extent to which it could claim a separate and individual existence, B. A. was Christian art; and consequently in Germany, where the subject has received more attention than in this country, the two terms are frequently used as synonymous. The appearance of B. A., in this its only peculiar sense, dates from the age of Justinian, i.e., from the earlier half of the 6th c., and its productive period may be said to terminate with the conquest of the eastern empire by the crusaders in 1204. But though its declension dates from this event, B. A. continued to exist in considerable vigor down to the final destruction of the empire of the east, in 1453; and even now may be seen as the inseparable handmaid of the Greek church, both in Europe and in Asia. It is in this point of view, and more particularly as forming the basis of artistic life in Russia, that B. A. possesses its chief living interest in our day. What Rome was to the western, Byzantium was to the eastern European; and the relation of the latter to his mother-city, if it commenced at a somewhat later date, continued during the whole period of the middle ages.

Though the inhabitants of eastern Europe thus derived their traditions of antiquity from a meaner source than the Romanic nations, they received them more unbroken; and, from first to last, were subjected to their influences during a much longer period. To them the living voice and hand continued to communicate what for nearly a thousand years Italians, Spaniards, and Franks had had to seek in the dead image and letter alone; and if anything still remains unrecorded of ancient thought, it doubtless dwells on Greek, and not on Roman or German tongues. Indolent, luxurious, and dissolute as their ancestors had been in classical times, the citizens of Constantinople were distinguished by an intellectual character, which, unfruitful and enfeebled though it was, was systematic, subtle, mystical, and pedantic. They were eminently an instructed people; but, like individuals whose glory is in the past, they were more conservative than original; and, however justly we may despise the chaff which they engendered, it is impossible to overestimate the value of the corns of gold which clung to their memories.

BYZANTINE ARCHITECTURE. The typical form of B. A., at least as applied to ecclesiastical purposes, was fixed by the church of St. Sophia, which still exists as the great mosque of Constantinople. It was built, or rather rebuilt, by the orders of Justinian, the architects being Anthemius of Tralles, and Isidorus, the elder, of Miletus, and completed 537 A.D. Though the largest and most magnificent, the church of St. Sophia was but one of 25 churches which were erected in the capital, and of a vastly greater number of ecclesiastical structures with which the provinces were adorned by the pious emperor. The style thus introduced largely influenced the architecture even of western Europe; and in St. Mark's at Venice, the churches at Ravenna and elsewhere on the Adriatic, and even in the cathedral of Aix-la-Chapelle, we have examples of churches almost purely Byzantine. The fundamental principle in the construction of Byzantine churches was an endlessly varied application of the Roman arch, whilst its exhibition in the form of the cupola was their most characteristic feature. In the St. Sophia, as was generally the case, the cupola covered the principal central portion of the church, and was supported by strong and lofty pillars, bound together by bold arches. To this central space were usually joined others of smaller size, which were covered by half-cupolas or arches of more ordinary construction. Though frequently in the form of a Greek cross, with the great cupola rising in the center, and smaller or semi-cupolas surmounting the four arms, neither this nor any other plan was consistently adhered to in Byzantine churches. The windows were always semicircular, similar to those in the Romanic churches of Germany, and in our own Saxon or early Norman churches; but the doors were frequently square-headed, after the classical model. Many of the details, such as the square capitals tapering downwards, and the bold projecting moldings ornamented with foliage, seem to have owed their origin entirely to the ingenuity of Byzantine architects. The earlier Byzantine churches were profusely ornamented with mosaics, which, after the admixture of the Gothic element, and the adoption of the pointed arch, gave place to fresco-paintings. The constant use of the apse (q.v.) is, after the cupola, perhaps their most marked feature. The following division into periods, though, like most divisions of the kind, somewhat arbitrary, has the authority of M. Couchaud, an eminent French architect, in its favor, and is, apparently, adopted by Parker: 1. From the time of Constantine to the middle of the 6th c.; 2. From the beginning of Justinian's reign down to the 11th c., which comprises the greater part of the existing buildings of the pure Byzantine type; 3. From the 11th c. to the conquest of Greece by the Turks,

when the influence of the Venetian conquests is apparent in the intermixture of Italian and Gothic details and characteristics. See ARCHITECTURE.

BYZANTINE SCULPTURE. When contrasted with the ignoble, tasteless, and meaningless productions of the later plastic art of Rome, that of Constantinople claims both admiration and respect. The figures are not deficient in dignity either in form or in attitude, and a deeply Christian spirit is traceable both in their general conception, and in their rich and significant symbolical accompaniments. In sculpture, as in architecture, the peculiar Byzantine type first exhibits itself towards the beginning of the 6th century. Alongside of unmistakable reminiscences of the antique, it exhibits characteristics which are as unquestionably oriental. The figures are positively laden, not with drapery alone, but with costume, which obscures the nobler and freer lines in which the ancients delighted. The execution is careful, even painful. All this becomes more and more the case as we advance in the order of time, the earliest Christian works, and those immediately suggested by the antique, exhibiting such faults only to a limited extent. Down to the 12th c., the defects which we have described were the worst which could be laid to the charge of B. sculpture, and it is scarcely earlier than the 13th c. that it assumes that mummy-like aspect by which it is too generally known. The art of carving in ivory was practiced with great success at Constantinople, and in the examples of it which remain, the gradual decline—the *benumbing process*, as it has been aptly called—may be traced with great distinctness. Of this species of work, in its earlier and better time, a fine specimen in alto-rilievo of the “forty saints” may be seen in the museum at Berlin. The decorations of the churches, and of the sacred vessels used in the service of the altar, formed no insignificant objects of art in the better Byzantine period. Cups, plates, lamps, candlesticks, crosses, and the like, were either of gold or silver, and frequently adorned with jewels; whilst the altar itself, the chancel, and sometimes the whole interior of the church, were covered with precious metals, the panels being adorned with mosaics or frescos.

BYZANTINE PAINTING. The same characteristics which we have ascribed to the sculpture belonged to the pictorial efforts of the artists of Byzantium, and of the neighboring countries who were mostly their imitators. The execution was careful and anxious rather than skillful, and such skill as still remained was exhibited in the mechanical perfection with which the gilding of the backgrounds and other details were managed. Of B. pictures, the best existing specimens are to be found in Italy, and belong especially to the school of Sienna. The picture of the Virgin in the church of St. Domenico at Sienna by Guido, bearing date 1221, deserves special mention. Much labor was expended on the illumination of MSS. of the Scriptures, and of these many beautiful examples, as fresh as when they were painted, may be seen in most of the larger public libraries of Europe. The chief interest attaching to B. painting consists in the parental relation in which it stood to the art of Italy. Cimabue may be regarded as its immediate heir; and in the works of Giotto, Leonardo da Vinci, Pietro Perugino, and even of Raphael in his earlier time, the traces of the inheritance are quite unmistakable. See PAINTING.

BYZANTINE EMPIRE, also styled the EAST ROMAN, EASTERN, or GREEK EMPIRE, was founded in 395 A.D., when Theodosius the great, at his death, divided the Roman empire between his two sons, Arcadius and Honorius. The former, a weak and luxurious character, was made emperor of the eastern division, formerly included under the prefectures of the east and of Illyricum—namely, Syria, Asia Minor, and Pontus, stretching along the shores of the Black sea in Asia; Egypt in Africa; and Thrace, Mœsia (now Bulgaria), Macedonia, Greece, and Crete in Europe. Arcadius left the government of the empire in the hands of his minister, Rufinus, from whom it passed to the eunuch Eutropius, and afterwards to Gainas, the murderer of Rufinus. Gainas fell by his ambition in 401, and the shameless and avaricious empress Eudoxia ruled until the time of her death, 404. See ARCADIVS. After Theodosius II., a minor, under the guidance of the prefect Prætorio Anthemius, had held the reins during six years, he resigned the government in favor of his sister Pulcheria (Augusta), who ruled powerfully while her brother was kept apart from all state affairs. Western Illyria (comprehending Pannonia, Dalmatia, and Noricum) was ceded to the Eastern empire by the Roman emperor, Valentinian III.; and after several victories achieved by the Byzantine general, Ardaburius, over the Persians, a part of Armenia was also annexed. But, nevertheless, Thrace and Macedonia could only be secured from the destructive conquests of Attila by the payment of tribute. After the death of Theodosius II., Pulcheria married the senator Marcianus (450–57), whose firmness repelled the invasions of Attila. Marcianus was followed by Leo I., surnamed Macella (the butcher), a Thracian of low birth, but elevated to the throne by the commander-in-chief, Aspar, who, being himself an Arian, would not venture to encounter the perils that sovereignty might have entailed on one of his religious views. Leo II., grandson of the former, succeeded, but died after a few months, in consequence of which the crown came into the possession of his father, Zeno (474–91), who was banished by Basiliscus (475), but who re-ascended the throne in 477. Though a weak and unpopular ruler, he contrived to retain his power in spite of several serious revolts. The internal distraction of the empire, to which, as at other times, religious strifes added considerably, increased greatly during the reign of Zeno,

and the invasions of the Goths were prevented only by gifts and stratagems. Ariadne, widow, of Zeno by her second marriage raised the courtier Silentiarius to the throne under the title Anastasius I. (491-518). By the help of the Goths, this monarch overthrew, after a six years' contest, the robber tribes at Mt. Taurus. A new enemy, however, now appeared on the Danube in the Bulgarians, against whose desolating raids Anastasius built the long wall, to protect the peninsula on which Constantinople lies. The war with the Persians also broke out anew during his reign; and religious tumults again purpled the streets of Constantinople itself. After his death, the army raised Justinus I. to the throne. He maintained his position mainly through the favor of the clergy, whom he had conciliated by his severe persecution of heretics.

His nephew, Justinian (q.v.), succeeded (527-65), and became celebrated by his code of laws, and by the victories of his great generals, Belisarius (q.v.) and Narses (q.v.). But the rapid decline of the empire after his death showed that he had not been able to give it any internal consolidation or vitality. It was during the reign of Justinian that those pestilent contests of the blues and whites against the greens and reds (political factions so named from the colors respectively worn) first attained any consequence; and though the first disturbance was terribly chastised by Belisarius in 532, they continued to distract the capital periodically down to the 7th century. Justin II. (565-78), a weak man, governed by his wife, Sophia, yielded a part of Italy to the Longobards, was unsuccessful against the Persians, allowed the Avari to plunder the Danubian provinces, and ultimately became insane through vexation and anxiety. Tiberius, the capt. of the guard, was then made regent, and after the death of Justin II., received the imperial dignity. He ruled with mildness and prudence (578-82), purchased a peace with the Avari, concluded the war with Persia, and left as his successor the commander-in-chief, Maurice, who reigned from 582 to 602. Having replaced on the throne the Persian king, Kosroes II., who had been banished by his subjects, he thus secured the peace of his eastern frontiers; but, on the other hand, the war against the Avari did not prosper. His niggardly treatment of the army caused a military insurrection, in which he was slain along with his son; and Phocas, one of his generals, was elevated to the throne. Phocas proved a bad ruler. Through his monstrous vices, tyranny, and incapacity for government, the empire lapsed into still deeper anarchy. Suddenly, however, a deliverer appeared in the person of Heraclius (q.v.), son of the exarch or governor-general of Africa, who headed a conspiracy, marched to Constantinople, overthrew the tyrant, and ascended the throne, 610. But great as was the genius of Heraclius, he had to submit to twelve years of defeat before he could organize and discipline a victorious army. In 622, he opened those magnificent campaigns in which the power of Persia was crushed, and which, in the opinion of Gibbon, were equal to those of Scipio or Hannibal. He lived, however, to see more formidable foes in the Arabs, who, inspired by fanatic zeal, and led by the caliph Omar, captured, during 635-41, the countries on the Euphrates, with Syria, Judea, and Egypt. The power of the Greeks, which was demanded to resist the Arabian invasions, was miserably divided and weakened by their unending religious quarrels, especially the controversy of the Orthodox against the Monothelites (q.v.). The empire was breaking asunder, and Heraclius, now worn out with the fatigues of war, had abandoned his enfeebled senses to pleasure, and his enfeebled intellect to theological discussions. He died in 641. Constantine III., who succeeded his father, Heraclius, also died soon after, and was followed by Heraclonas, who lost the crown, and was mutilated in an insurrection. The next ruler was Constans, the son of Constantine III., who ruled from 642 to 668, made himself odious by cruelty, and perished in an insurrection. His son, Constantine IV., Pogonatus (668-85), enforced a treaty of peace on the invading Arabs (675) by his successful use of the Greek fire, in warfare. On the other side, he was compelled to pay tribute in 680 to the Bulgarians, who had established themselves in ancient Mœsia. Justinian II. (685-711), son and successor of Pogonatus, was victorious in war against the Monothelite Maronites; but was defeated by the Bulgarians (688), and by the Arabs (692). His cruelty caused an insurrection, at the head of which was Leontius, who, in 695, deposed him, cut off his nose (hence his surname *Rhinotmetus*), and banished him to the Tauric Chersonese; in 705, he was restored to the throne, but adversity had taught him no wisdom. A part of his subjects revolted, and the king, abandoned by his army and by the Bulgarians, was assassinated in 711. With him the dynasty of Heraclius expired.

Philippicus Bardanes (the leader of the last insurrection against Justinian II.) was next raised to the throne (711); but having made himself odious by favoring the metaphysical tenets of the Monothelites, he was deposed, and brutally deprived of eye-sight (713). His successor, Anastasius II., prudently screened himself from a mutinous army by retiring into a monastery (716), and left the crown to Theodosius III., who abdicated in 717 when Leo, the Isaurian, and gen. of the army of the east, did not recognize him, and marched with hostile intent to Constantinople. Leo (q.v.) himself ascended the throne in 717, and drove back the Arabs from Constantinople, but unhappily gave occasion, in 726, for that contest concerning the worship of images, which rent the empire for more than a century. In 728, the exarchate of Ravenna was lost, and the eastern provinces became the prey of the Arabs, over whom, however, he won a great victory in Phrygia. He died in 741. Constantine V. (741-775), son of Leo III., on account of his zeal as an iconoclast, was hated by the monks, who gave him the surname "Cop-

ronymos," because (according to their malicious and uncleanly statement) he had polluted the font at his baptism. He was a brave ruler, recovered from the Arabs parts of Syria and Armenia, and ultimately defeated the Bulgarians, against whom he had long been unsuccessful. His son, Leo IV. (775-780), was a mild ruler; but by the ability of his generals, he made the boundaries of the empire secure against the Arabs. After him, Constantine VI. ascended the throne under the guardianship of his ambitious mother, Irene (q.v.), who raised a powerful party in favor of image-worship. Constantine having made an attempt to liberate himself from the influence of his mother and her paramour, Stauratius, Irene barbarously caused her own son to be blinded (797). He died soon after this atrocity; and Irene, who had boldly conceived the design of marrying the emperor Charlemagne, and thus uniting the e. and w. of Europe in one vast realm, excited the opposition which, in 802, placed her treasurer, Nicephorus, on the throne. Irene was banished to Lesbos, where she died in 803. Nicephorus, who fell in battle against the Bulgarians (811), was succeeded by his son, Stauratius, who soon yielded the throne to his brother-in-law, Michael I., from whom it was taken by the Armenian gen., Leo V., a powerful ruler, who conquered the Bulgarians, but fell (820) in a conspiracy excited by his zeal against image-worship. Michael II., the stammerer, was raised from a dungeon to the throne, and ruled until 829. In his reign, Crete and Sicily passed into the hands of the Arabs. Under the rule of his son, Theophilus, who is praised by the Byzantine historians for his love of justice (829-842), the gen., Manuel, gained some indecisive victories over the Arabs. Theodora, widow of Theophilus, and guardian of Michael III. (842-867), brought the controversy about images to a close at the council of Nicæa (842), when the worship of these was fully sanctioned and re-introduced. During this reign the government busied itself in the persecution of the Paulicians (q.v.), while the Arabs devastated the Asiatic provinces. Theodora, having been banished to a convent by her son, the government was for some time held by Bardas, uncle of Michael III., and after his assassination, by Basilus I., the Macedonian, who caused Michael to be put to death, and afterwards ruled ably from 867 to 886. But though on the whole successful against the Arabs, the latter contrived to make themselves masters of Syracuse. His dynasty (the Macedonian) maintained itself on the Byzantine throne, with some few interruptions, until 1056. The reign of his son, Leo VI., the philosopher, (886-912), was not prosperous. The inroads of the Bulgarians and of the Arabs, who, in 904, plundered Thessalonica, continued to increase during the government of his son, Constantine VII., Porphyrogenitus, who ruled mildly but feebly (912-959). Under his son, the dissolute Romanus II. (959-963), Crete was retaken from the Arabs by the vigor of his gen., Nicephorus Phocas, who, on the death of the emperor, married his widow, Theophania. She, however, caused him to be murdered in 969, as she wished to marry John Tzimiskes, who ruled till 976, and, like his predecessor, was victorious against the Arabs and Bulgarians, as also the Russians, who about this time began to emerge from obscurity as an enemy of the Byzantine power. His successor, Basilus II. (976-1025), the son of Romanus, conquered the Bulgarian kingdom, and attached it as a province to the empire, which it remained till 1186, when it again became independent. His brother, Constantine VIII. (1025-28), did not resemble him. Romanus III. next ascended the throne, but was assassinated by his wife, Zoe, a profligate but crafty princess, who raised successively to the imperial dignity Michael IV. (1034), Michael V. (1041), and Constantine IX. (1042). Meanwhile, Russians and Arabs devastated the realm. In Asia, the Seljuk Turks proved dangerous enemies; while in lower Italy, the Normans narrowed the Byzantine power to the possession of Otranto. After Constantine's death in 1054, Theodora, sister of Zoe, was elected empress; and on her death in 1056, Michael VI., who was deposed by Isaac I., Comnenus.

With Isaac I., Comnenus, who came to the throne in 1057, the dynasty of the Comnenian emperors began. He retired to a monastery (1059), and was succeeded by Constantine X., whose widow, Eudocia, married Romanus IV., and raised him to the throne. Romanus was deposed in 1071 by Michael VII. (son of Constantine X.), who, in his turn, was dethroned by Nicephorus III. (1078), who reigned until 1081, when he was deposed by Alexius I., Comnenus (q.v.), (1081-1118). This last reign was marked by the commencement of the crusades. The successors of Alexius—his son, Kalo-Joannes (1118-43), and Manuel I. (1143-80)—were able rulers, and victorious in their engagements with the Turks. Manuel's son, Alexius II., was murdered by his guardian, Andronicus (grandson of Alexius I.), who raised himself to the throne. He was the last prince of the Comnenian dynasty, and fell in an insurrection excited by his own cruelty, 1185.

After the first turbulent reign of Isaac II., who was blinded and deposed by his brother, Alexius III., who took the surname of Comnenus in 1195, the crusaders restored Isaac to the throne (1203), and also crowned his son Alexius IV.; but the restless citizens of Constantinople elected Nicolas Kanabus, who took the title of Alexius V., and pursuing the usual bloody course, put his predecessor to death.

In 1204, the French and the Venetians (collectively named *Latins*) advanced on Constantinople, and captured the city, April 12, having made themselves masters of the European provinces. The whole was divided into four parts, of which the first, including the metropolis, fell to the lot of Baldwin, count of Flanders, who was made emperor, and to whom the other participants in the expedition did fealty for their respective shares. The Venetians obtained the coasts of the Adriatic and Ægean seas, a part of

the Morea, and several islands; Bonifacius, count of Montferrat, Macedonia, and part of Greece; several dukedoms, countships, etc., were also established at Athens, Philippopolis, and other places for French knights; while a number of Greek princes, both on the mainland and in the islands, maintained their independence. In the w. of Asia Minor, Theodorus Lascaris, who had been elected emperor at Constantinople, formally transferred the seat of government to Nicæa; and finally, in the n.e. of Asia Minor, the governor of the province of Colchis, Alexius Comnenus, ruled at Trebizond with absolute authority; while one of his successors, John Comnenus, even assumed the title of emperor. At Constantinople, neither Baldwin nor his successors could strengthen the sinking empire. Baldwin himself died (1206) a prisoner in the hands of the Bulgarians. After him came his brother Henry, who ruled bravely and wisely till 1216. For the next four years, the empire was actually without a ruler, and a prey to utter anarchy. In 1221, Robert, son of Peter, count of Auxerre and Courtenay, came to the throne; and was succeeded by John of Brienne, titular king of Jerusalem (1228-37); and the latter by Baldwin II. (1237-61). During these reigns, a great part of the empire was seized by John Vatazes, successor of Theodorus Lascaris of Nicæa (1222-55). This ruler was followed in Nicæa by Theodorus II. (1255-59), whose son, Johannes, during his minority, was superseded by Michael VIII., Palæologus, who, by the help of the Genoese, captured Constantinople (July 25, 1261), and thus put an end to the Latin dynasty; though some few Latin principalities maintained themselves till the fall of the Byzantine empire.

Michael, the first of the Palæologi, a powerful prince, really endeavored to strengthen the realm; but, by his unhappy attempt to unite the Greek church with the Latin, from which it had decisively separated (1054), he gave great offense to the clergy and the people. His son, Andronicus II., who came to the throne, 1282, re-established the Greek ritual. After the death of his son and co-regent, Michael IX. (1320), Andronicus II. was compelled to divide the throne with his grandson, Andronicus III., who became sole emperor, 1328. This monarch unsuccessfully opposed the Turks, who took Nicæa and Nicomedia in 1339, and wasted the European coasts. He died in 1341. Under his son, Johannes V., the Turks first gained a firm footing in the European provinces, and spread themselves from Gallipoli (which they captured in 1357) over other districts. Sultan Murad took Adrianople, 1361, and made it the seat of government. He and his follower, Bajazet, conquered all the Byzantine territories as far as Constantinople. Manuel II., son and successor of Johannes, was besieged in Constantinople by Bajazet, who defeated an army under Sigismund of Hungary, at Nicopolis, in 1396, and compelled the Byzantine monarch to cede to the Turks one of the main streets of the city, which was saved from capture only by Timur's incursions into the Turkish territories, 1402. By this diversion Manuel recovered some portion of the Byzantine provinces; but made so little use of the occasion, that, in 1422, the metropolis was again besieged by Murad II., who, after he had overthrown the force sent to aid the emperor by Ladislaus, king of Hungary, at the battle of Varna, made Constantinople, in 1444, the limit of the domains of Johannes VI., son of Manuel, and compelled him to pay tribute. Constantine XI., brother of Johannes, bravely but fruitlessly contended against the overwhelming Turkish forces, and fell heroically in the defense of Constantinople, which was captured by Mohammed II., May 29, 1453, when the B. E. was brought to a close. The petty Latin princes who existed here and there in Greece, and the despots, Demetrius and Thomas, who ruled in the Morea, were subdued by Mohammed in 1460; while David, a member of the Comnenian dynasty, the last emperor of Trebizond, submitted in 1461.

It is almost superfluous, after this painful and bloody record of dynastic crimes and tumults, continuing century after century for upwards of a thousand years, to affirm that the history of the world never witnessed so miserable and degraded a caricature of imperial government as the B. E. affords, or to express the conviction that nature was sternly satisfied to behold it finally swept from the face of the earth, even by the hands of barbarous Turks.

The constitution of the B. E. was founded on the institutions of Diocletian and Constantine the Great, and was purely despotic. The emperors, who were consecrated by the patriarchs of Constantinople, claimed, as the true descendants of the Cæsars, a sovereignty over the west as well as the east, and styled themselves "rulers of the Romans," even after Charlemagne had founded a new dynasty. Though great influence was at various times exercised by the clergy as well as by women, courtiers, and ministers, the emperors were pure autocrats, having supreme power in all departments of government, and being themselves superior to all laws. By pompous titles, by great splendor of costume, and by a strict observance of an elaborately minute court ceremonial, as well as by the cruel penalties inflicted for any insult offered to the imperial dignity, or to the dignity of the emperor's relatives, they kept themselves sacredly apart from the people. Gradually, everything disappeared that might have been a check upon the utter despotism of the supreme power. As early as the 6th c., the consulate was absorbed into the mass of imperial honors, while the traces of the senate which Constantine had established at Byzantium, and which was composed of those on whom the emperor had bestowed the dignity of patriciate, as well as the chartered privileges of the towns, had entirely vanished in the 10th century. The privy council, to whom the conduct of the state was intrusted, was arbitrarily chosen by the emperor. The state officials were very numer-

ous, and their respective ranks carefully distinguished. They were raised far above the populace by titles and privileges, but were utterly dependent on the throne. Among these, the *domestici* (including many eunuchs), claimed the highest rank as immediate attendants on the emperor. The rank of the *europalates*, who had charge of the four chief imperial palaces, became, in course of time, subordinate to that of the *protovestarius*, who was invested with the highest dignity of all. The *domestici* were made commanders-in-chief of the army. Among them, the *domesticus* of the east (styled, *par excellence*, *megadomesticus*) held the highest rank, and finally, under the Palæologi, was considered the first civil and military officer of the realm. The provinces were ruled by governors bound to contribute certain sums to the royal revenue, which gave rise to oppressive exactions. No distinction was made between the state-revenue and the privy-purse. For military service, the land was divided into districts (*themata*); and the army, down to the later times, consisted almost entirely of foreign mercenary troops, the imperial body-guard, or *spatharii*, who were mainly Germans, holding the highest rank. The admiral of the fleet was styled *megas dux*. In the midst of constant internal and external disturbances, the administration of justice was grossly neglected and abused, though Justinian and other emperors earnestly endeavored to establish just laws.

BYZANTINE HISTORIANS are those Greek writers who have handled the history of the Byzantine empire. They are divided into three classes—1. Those whose works refer exclusively to Byzantine history; 2. Those who professedly occupy themselves with universal history, but at the same time treat Byzantine history at disproportionate length; 3. Those who write on Byzantine customs, antiquities, architecture, etc. The B. H. are far from faultless, yet, as they are the only sources of information regarding the vast empire of the east, they are invaluable to us. The most interesting and instructive among them, however, are those who confine their attention to a limited number of years, and to the events which transpired under their own observation, or in which they took part. The principal B. H. were collected and published at Paris in 36 vols., with Latin translations under the editorship of P. Philippe Labbé, a Jesuit, and his successors (1648-1711). This magnificent collection was reprinted, with additions, at Venice, 1727-33. In 1828, Niebuhr, assisted by Bekker, the Dindorfs, and others, began a *Corpus Scriptorum Historiæ Byzantinæ*, carried on till 1855, and continued in 1872 by the *Bibliotheca Græca Mediæ ævi*.

BYZANTINE RESCENSION, the Greek New Testament used in Constantinople after that city became a see in the eastern church; also used as the basis of the old Slavonic version. It differs very little from the received text.

BYZANTINES, in numismatics, is the term applied to coins of the Byzantine empire. Byzantine coins are of gold, silver, and bronze; bear impressions distinct from those of the earlier Roman coins; and were copied in several countries where the Byzantine standard was adopted. The commercial relations of the eastern empire served to distribute its coinage over almost all the then known world. It was current in India, as well as in the n. of Europe. Recently, an increased attention has been paid to the study of Byzantine coins as aids to history.—Saulcy, *Essai de Classification de Suites Monétaires Byzantines* (Metz, 1836). See BESANTES.

BYZANTIUM, a city which stood on the Thracian Bosphorus, was first founded by emigrants from Megara in 667 B.C., and rapidly rose to importance as a seat of commerce. Its position was at once secure and enchanting; it commanded the shores of Europe and Asia, had magnificent facilities for trade, and was also encircled with rich, picturesque, and varied scenery. After a time of subjugation under Darius Hystaspes, B. was liberated from the Persian yoke by Pausanias. Along with other Grecian seaports, B. revolted from Athens in 440 B.C., but was captured by Alcibiades (408). Lysander recovered it for the Lacedæmonians in 405. Shortly afterwards, it renewed its alliance with Athens, and in 390, Thrasybulus altered its form of government from an oligarchy into a democracy. When Athens again acquired a dangerous importance as a naval power, B., in 356, leagued itself with Chios, Rhodes, and king Mausolus II., of Caria, and crippled the trade of the former city; with which, however, it again formed an alliance, through the influence of Demosthenes, in opposition to Philip of Macedon, who, in 341-340 B.C., vainly besieged Byzantium. Under Alexander the great, B. retained a certain degree of independence. For some time, B. was tributary to the Gauls, who settled in Thrace, after the death of Brennus (280 B.C.). After the second Punic war, when the Romans began to interfere in the affairs of Grecian and Asiatic cities, B. attached itself to Rome, and, retaining almost entire its former liberties, maintained also its commercial importance. In the civil war between Septimius Severus and Pescennius Niger, B. sided with the latter. It was therefore besieged by Severus, and, after a brave defense of 3 years' duration, was captured in 196 A.D., and reduced to ruin. Severus, repenting of the desolation which he had made, rebuilt a part of the city under the name of *Augusta Antonina*, and ornamented it with baths, porticos, etc. Caracalla restored to the inhabitants their ancient privileges; and in 330 A.D., under the name of New Rome or Constantinople, it was made the metropolis of the Roman empire. See CONSTANTINOPLE.

BZOVIUS, or BZOWSKI, ABRAHAM, 1567-1637; a Polish Dominican, one of the most voluminous writers of his time. He was professor of philosophy and theology at Milan and Bologna. He continued the ecclesiastical annals of Baronius from 1198 to 1532.

C

C THE third letter in all the alphabets derived from the Roman. It corresponds in place to the Greek gamma (*Γ*), and had originally the same sound—viz., that of *g* in *gun*; as is expressly recorded, and as is proved by very old inscriptions, on which we read *leciones*, *leece*, for what were afterwards written *legiones*, *lege*. This medial or flat guttural sound of *c* was at an early period of Roman history lost in the sharp guttural or *k*-sound (see ALPHABET), and this continued to be the pronunciation of the letter *c* in Latin down at least to the 8th c. of the Christian era, not only in such words as *comes*, *clamo*, but also before the vowels *e* and *i*. Such Latin words as *Vicero*, *fecit*, are uniformly represented in Greek by *Kikero*, *phakit*; and in the times of the empire, the Germans borrowed *Kaiser*, *keller*, from *Cæsar*, *cellarium*.

It seems difficult, at first sight, to account for the same letter having sounds so different as those heard in *call* and in *civil*. The beginning of the transition is to be found in the effect produced upon certain consonants by their standing before *i* followed by a vowel. Thus, in *nation*, *ti* has the effect of *sh*; and out of *diurnal* has sprung *journal*. In such combinations, *i* is originally a semi-vowel having the force of *y*, and it is easy to see that *tyon*, *dyur*, pronounced in one syllable, cannot but slide into the sibilant or hissing sounds of *shon*, *jur*. A precisely similar effect is produced on the *k*-sound before *ia*, *iu*, *io*; in *Lucius*, *Porcia*, or rather *Lukyus*, *Porkya*, *ky* tends to slide into a hissing sound similar to that of *ty* and *dy*. This tendency showed itself early in the Latin tongue; and in the vulgar Latin of later ages, and in the Romanic tongues that sprang out of it, it fully developed itself, so that the Italian came to pronounce *Lucia* as if written *Lutshia*. Combinations like *ceo*, *cea*, are little different from *cio* and *cia*, and would naturally follow the same course; and the *s*-sound being once associated with the letter *c* in these positions was gradually extended to it in cases where the *e* or *i* was not followed by a vowel.

The Anglo-Saxon alphabet resembled the Roman, from which it sprang, in having no *k*, and in always using *c* with the sound of *k*; *king* and *keen* were spelled *cynning* and *cene*. It was also without *g*, for which *cw* was used—*quick* being spelled *cwic*. By a process analogous to that described above, such Anglo-Saxon words as *ceorl*, *ceosan* (pro. *kyorl*, *kyosan*), became transformed into the English *churl*, *choose*. And this suggests a natural explanation of the multitude of cases where the *c* of the Latin has been transformed into *ch* in French, and has passed in this form into English—e.g., Lat. *caput*, Fr. *chef*, Eng. *chief*; Lat. *caminus*, Eng. *chimney*; Lat. *carmen*, Eng. *charm*. For as the Anglo-Saxons turned the *karl* or *kort* of the other Gothic nations into *kyorl*, so doubtless the Romanized Gauls corrupted the pronunciation of the Latin *camera*, for example, into *kyamera* (compare Eng. *cart*, pro. by some *kyart*), which would then readily slide into *chambre*.

In the other Germanic alphabets, which were derived partly from the Roman and partly from the Greek, the Greek *kappa* or *k* is used almost to the exclusion of *c*, which, in German, Swedish, etc., appears only in words borrowed from the Romanic languages. See letter K.

In modern English, *c* is pronounced like *k* before the vowels *a*, *o*, *u*, and like *s* before *e*, *i*, and *y*; and where the sharp guttural sound has to be represented before *e*, *i*, and *y*, the Germanic *k* has superseded the Anglo-Saxon *c*, as in *king*, *keen*. In so far as mere sound is concerned, *c* is a superfluous letter in English; in every case its power could be represented either by *k* or by *s*. In the corresponding words of the several Aryan languages, we find various substitutions for *c*, thus: Lat. *calamus*, Eng. *halm* (stalk), Rus. *soloma*; Lat. *cord*, Eng. *heart*, Rus. *serdtse*; Lat. *collum*, Ger. *hals* (neck); Lat. *acer* (sharp); Fr. *aigre*, Eng. *eager*; Lat. *duc* (lead or draw), Ger. *zog*, Eng. *tug*; Gr. *pepo*, Lat. *coquo*, Eng. *cook*; Lat. *dictus*, Ital. *ditto*. *C* sometimes disappears before *l* and *r*; thus: Gr. *kleo* (to sound one's fame, allied to *kaleo*, to call or shout), Lat. *laudo*, to praise, Ger. *laut*, voice, Eng. *loud*, old Ger. *hlud*, fame (hence Hludwig or Clodowig, Clovis, Louis).

C, in music, is the name of one of the notes of the gamut. The scale of *C* major has neither flats nor sharps, and therefore is called the natural scale. The different octaves of the gamut, beginning with *C*, are called by the Germans the great, small, one-stroked, two-stroked, etc., beginning with

C is also the sound on which the system of music is founded, and from which the mathematical proportions of intervals are taken; that is, a string of a given length sounding *C*, when divided into certain proportions, is made to produce harmonically the intervals of the different fundamental chords.

C MAJOR, the first of the twelve major keys in modern music; being the natural scale, it has no signature.

C MINOR, the tonic minor of C major, has three flats for its signature—viz., B flat, E flat, and A flat.

CAABA. See KAABA.

CAALING WHALE, *Globicephalus deductor*, an interesting cetaceous animal, which has been very generally included by naturalists in the genus *delphinus* with dolphins (q.v.) and porpoises (q.v.), being named by some *delphinus melas* (Gr. black), by others *D. globiceps*, from the round form of its head, but which has recently been separated from the true dolphins, either as a species of porpoise (*phocena*), or as the type of a distinct genus, *globicephalus*, principally characterized by the rounded muzzle, and the convex and rounded top of the head. The general form of the animal is not unlike that of the common porpoise, but it is much larger, being from 16 to 24 ft. in length. The body is thick, its circumference at the origin of the dorsal fin, where it is greatest, being rather more than 10 ft., tapering towards the tail, which is deeply forked. The pectoral fins are remarkably long and narrow, fully 5 ft. in length, differing very much in this respect from those of every other known cetaceous animal. The whole number of vertebrae is 55. The color is black, with a white streak from the throat to the vent; and the skin is beautifully smooth, shining like oiled silk.

The whale feeds on cod, ling, and other large fishes, but also to a great extent on cephalopodous mollusca, the cuttle-fish, indeed, seeming to be its principal food. It is the most gregarious of all the cetacea, great shoals or herds being usually seen together in the northern seas which it inhabits. These herds exhibit the same propensity with flocks of sheep, when pressed by any danger, to follow their leaders, so that when they are hemmed in by boats, if one break through to the open sea, all escape; but if one is driven ashore, the rest rush forward with such blind impetuosity as to strand themselves upon the beach, where they become an easy prey and rich prize to their pursuers. The common name is derived from the Scotch word *caa*, meaning "to drive."

CAB. See COACH.

CABAL', a term employed to denote a small, intriguing, factious party in the state, and also a union of several such, which, for political or personal ends, agree to modify or sacrifice their principles. The word was used to describe an English ministry in the reign of Charles II., the initials of whose names composed CABAL—viz., Clifford, Ashley, Buckingham, Arlington, and Lauderdale. This was not the origin of the word, however, as some have supposed; but merely the ingenious application of a word previously in use, and which appears to have been derived from the French *cabale*, possessing a similar signification.

CABALA. See CABBALA.

CABALLERO, FERNAN, the nom-de-plume of CECILIA BÖHL VON FABER; 1797-1877; b. Switzerland. She was educated in Germany, but in 1813 accompanied her father to Spain, and soon became enthusiastically attached to her adopted country. She was married three times, her last husband being a lawyer named Arrom. Her first novel, *La Gariota*, was published 1849, and was followed by many others, the chief of which are: *The Alavedra Family*, *Clemencia*, and *Elia*. She also published the first collection ever made of Spanish popular tales and poems, *Cuentos Poesias Populares Andaluces*, 1859. Her principal novels have been translated into most European languages.

CABANEL, ALEXANDRE, 1823-89; a French painter who occupied a place between the old classical and the modern realistic schools, was born in Montpellier. He studied under Picot and exhibited in the *Salon* of 1844, "The Agony of Christ in the Garden of Olives." In 1845 he received the second grand prize for painting, and from 1845 to about 1850 pursued his studies in Rome. Returning to France he exhibited, 1850-53, a "Saint John," "The Death of Moses," and other works. He obtained a second class medal in 1852; a first class medal in 1855 for "The Christian Martyr"; the medal of honor in 1865 at the *Salon* of 1865 for his portrait of Mme. de Ganay; in 1863 succeeded Horace Vernet as member of the Académie des Beaux Arts, and at the end of the year was made professor in that institution. After 1860 he made a specialty of portrait painting, but among later imaginative works were "Nymph carried off by a Faun" (1871), "The Birth of Venus," "Phædra" (1880); "Portia" (1884).

CABANIS, PIERRE JEAN GEORGES, a French physician, philosophical writer, and partisan of Mirabeau in the revolution, was b. at Cosnac, in the department of the Charente-Inférieure, 1757. When he had completed his studies in Paris (1773), he went to Warsaw, in the capacity of secretary to a Polish magnate. On his return to Paris, he was for some time engaged in literary pursuits, from which he turned his attention to an earnest study of medicine. At the outbreak of the revolution, he attached himself to the liberal side, but detested the cruelties which followed. For Mirabeau, whose opinions he received, he wrote a work on national education, which was published after the death of that great orator (1791). C. was one of the council of five hundred, afterwards member of the senate, and administrator of the hospitals of Paris. He died May 5, 1803. His chief work, *Rapports du Physique et du Moral de l'Homme*, completed in 1802, gained its author a considerable reputation as a writer and philosopher.

CABARET (Fr., *cabaret*, probably a contraction for *cabanaret*, from *cabane*, hut.) A tavern; a public house where liquors are retailed.

CABARRUS, a co. in s.w. North Carolina, on the N. C. railroad, watered by Rocky river; 392 sq.m.; pop. '90, 18,142, incl. colored. Soil moderately fertile, producing corn, wheat, cotton, etc. Co. seat, Concord.

CABARRUS, FRANCISCO DE, 1752-1810; a Spanish financier, originator of a bank and company for trade with the Philippine islands. He was one of the council of finance under Charles III., and proposed many reforms. Under Charles IV. he was accused of embezzlement and imprisoned, but soon after was released and made a count. Bonaparte made him a minister of finance, in which office he died. His daughter Thérèse, under the name of Mme. Tallien, afterwards princess of Chimay, was conspicuous in the closing days of the French revolution of 1789.

CABATUAN, a city of the province of Iloilo, on the island of Panay, one of the Philippines. It is situated on the banks of the river Tiguin, which so abounds with crocodiles that fishing is unsafe.

CABAZERA, capital of the province of Cagayan, island of Luzon, Philippines. Tobacco is grown very extensively in the province, and its manufacture affords employment to large numbers of people.

CABBAGE, *Brassica oleracea*, a plant in most general cultivation for culinary purposes in Europe and many other countries, cultivated also to a considerable extent for feeding cattle. It is a native of the rocky shores of Britain and other parts of Europe, more plentiful on the shores of the Mediterranean than in more northern latitudes, and in its wild state is generally from a foot to two feet high. This plant has been cultivated in Europe from time immemorial; it has likewise been cultivated from an early period in gardens and about villages in India. Few plants show so great a tendency to vary in their form through cultivation; and among the varieties of this one species are reckoned several of our most esteemed culinary vegetables, such as kale (q.v.) or greens, borecole, colewort (q.v.), savoy (q.v.), kohl rabi (q.v.), cauliflower (q.v.), and broccoli (q.v.)—plants which differ much in their appearance and in the particular qualities for which they are valuable, both from each other and from the original wild plant.

The wild C. has smooth sea-green leaves, waved and variously indented; the boiling of the leaves, or their forming close heads at a certain stage of the growth of the plant, so that the inner leaves are blanched, is peculiar to those cultivated varieties which commonly receive the name of cabbage.

The ordinary varieties of C. are often called by the general name of *white C.*, to distinguish them from the *red C.*, which is of a deep brownish-red or purplish color, and is chiefly used for pickling, for which purpose it is much esteemed. The *tree C.*, or *cow C.*, is a variety cultivated for cattle, especially in the Channel islands and the n. of France, of which the leaves do not close together into compact heads, but which is remarkable for its great height—reaching, when it is in flower, 10 ft. on rich soils—and for its branching stem. The stems of this kind are sometimes used as stakes for pease, and even as cross-spars for thatched roofs. The *Portugal* or *truncada C.*, also known as *couve tronchuda*, is a variety remarkable for its delicacy, and for the large midribs of its leaves, which are often used like sea-kale. It is an article of luxury like cauliflower, and requires a somewhat similar cultivation.—Cabbage-seed is sown either in spring or autumn, and the seedlings transplanted in rows at distances of two feet or upwards, according to the size of the variety. They are often planted closer, and the alternate plants cut young for open greens, for which the sprouts that arise from the stem of some varieties after the head has been cut off are also used. Cabbages require a rich, well-manured soil, and the earth about the roots ought to be often stirred. By sowing and planting at different dates and of different varieties, a succession is secured in the garden; and when winter approaches, part of the principal crop may be taken up and laid in a sloping position, so that only the heads are above the earth, in which way they are generally preserved without injury. In some places, cabbages are completely buried in the earth, the plants not being allowed to touch each other; and this method succeeds well in peaty or sandy soils.

The C., considered as food, contains more than 90 per cent of water, and therefore cannot be very nutritious: 100 parts of the ordinary C. consist of

Extractive.....	2.34
Gummy matters.....	2.89
Resin.....	0.05
Vegetable albumen.....	0.29
Green fecula.....	0.63
Water and salts.....	93.80

The digestibility of C. varies according as it is partaken of raw or boiled; thus, raw C. alone is digested in 2½ hours; raw C., with vinegar, in 2 hours; and boiled C. takes 4½ hours. Immense quantities of cabbages are used in Germany as *sauer kraut* (q.v.).

CABBAGE BARK. See **ANDIRA**.

CABBAGE BUTTERFLY, a name common to several species of butterfly, the larvæ of which devour the leaves of cruciferous plants, especially of the cabbage tribe, and are popularly known as cabbage-worms or kale-worms. The large C. B., or large white garden butterfly (*pontia brassicae*, or *pieris brassicae*), is one of the most common of British butterflies. It is white; the wings tipped and spotted with black. The wings, when expanded, measure from $2\frac{1}{2}$ to 3 in. across. The antennæ terminate in an ovoid club. The female lays her eggs, which are conical and bright yellow, in clusters of 20 or 30, on the leaves of the plants which are the destined food of the caterpillars. The caterpillars, when fully grown, are about 1 in. or $1\frac{1}{2}$ in. long, and are excessively voracious, eating twice their own weight of cabbage-leaf in 24 hours. When full grown, they suspend themselves by their tails, often under ledges of garden-walls, or similar projections, and are metamorphosed into shining pale-green chrysalids, spotted with black, from which the perfect insect emerges, either in the same season or after the lapse of a winter—no longer to devour cabbage leaves, but to subsist delicately upon honey, which it sucks from flowers.—See INSECTS.—The small C. B., or small garden white butterfly, sometimes called the turnip butterfly (*pontia* or *pieris rapæ*), very much resembles the large C. B., but the expanse of the wings is only about 2 inches. The eggs are laid singly on the under side of the leaves of cabbages, turnips, etc., and the caterpillars, which are of a velvety appearance, pale green, with a yellow line along the back, and a yellow dotted line on each side, sometimes appear in great numbers, and prove very destructive. They bore into the hearts of cabbages, instead of merely stripping the leaves, like those of the last species, and thus are a greater pest, even when comparatively few. The chrysalis is of a pale reddish-brown color, freckled with black.—Another species, common in Massachusetts, a white butterfly, *pontia oleracea* (Harris), deposits its eggs in cabbage, turnip, and radish beds, and the caterpillars, which are greenish in color, are very destructive.—The multiplication of these insects is generally prevented by small birds and by insects of the *ichneumon* (q.v.) tribe, which lay their eggs in the caterpillars, that their own larvæ may feed on them. See ILLUS., BUTTERFLIES, ETC.

CABBAGE FLY, *Anthomyia brassicae*, a fly of the same family with the house-fly, flesh-fly, etc., and of which the larvæ or maggots often do great injury to the roots of cabbages, and sometimes to those of turnips. It is of the same genus with the fly generally known as the turnip fly (q.v.), and also with the potato fly (q.v.), beet fly (q.v.), etc. It is about one fourth of an inch in length, and half an inch in expanse of wings; of an ash-gray color; the male having a silvery gray face, and a long black streak on the forehead; the female, a silvery-white face, without any black streak; the abdomen of the male is linear, that of the female terminates conically; the eyes of the male nearly meet on the crown, those of the female are distant, with a broad black stripe between them. The larva is very similar to that of the flesh-fly—yellowish white, tapering to the head, which has two black hooks. The pupa is rust-colored and horny.

CABBAGE MOTH, *Mamestra brassicae*, a species of moth, the caterpillar of which feeds on cabbage and turnip leaves, and is sometimes very destructive. The caterpillar is greenish-black, and changes to a brown pupa in autumn. The perfect insect is of a rich mottled-brown color, the upper wings clouded and waved with darker brown, and having pale and white spots, a yellowish line near the fringe, the fringe dotted with black and ocher, the under-wings brownish and white.

CABBAGE PALM, or CABBAGE TREE, a name given in different countries to different species of palm, the great terminal bud of which—the palm cabbage—is eaten like cabbage. The C. P. of the West Indies is *areca oleracea*. The southern states of America have also their C. P. or cabbage tree, otherwise called the palmetto (*chamærops palmetto*). See ARECA; PALMETTO; PALMS.

CABBALA (from Heb. *kibbel*, to receive), the received doctrine, by which is not to be understood the popularly accepted doctrine, but that inner or mystical interpretation of the law which the Cabbalists allege that Moses received from God in the mount, and subsequently taught to Joshua, who in his turn communicated it to the 70 elders, and which has ever since been the treasure of the select Jews. Since the 12th c., the study of this secret lore has gradually resulted in a distinct school and literature, the elements of which, however, are already visible in the Macedonian epoch, and the real or historical source of which is to be found in the eastern doctrine of emanation. In Philo, in the Talmud, etc., we certainly find theologico-philosophical conceptions, which were at a later period taken up and modified; but the first book on cosmogony is *Jezirah*, a production of the 7th c., attributed to Akiba. After the second half of the 12th c., the Cabbalistic doctrines, which had at first been confined to such high themes as God and creation, began to include exegesis, ethics, and philosophy, and so became a kind of mystical religious philosophy. The numerous Cabbalistic writings composed during the three subsequent centuries, professed to teach the secret or mystical sense of Holy Writ, and the principles on which it is grounded, the higher meaning of the law, as well as the method of performing miracles, by the use of divine names and sacred incantations. The Cabbalists, moreover, prepared books, which they attributed to the oldest authorities—for instance, *Sohar*, a work written in Aramaic, during the 13th c., and fathered upon Simeon-ben-Joachai, a scholar of Akiba. This became the Bible of the Cabbalistic

neophytes. The chief opponents of the Cabbalists were the philosophers, and in part the Talmudists. Towards the close of the 16th c., the Cabbalistic wisdom, which by that time had degenerated into magic and word-juggling, received a new impulse from its teachers in Palestine and Italy. Since the time of Reuchlin, many Christian scholars have investigated the subject.

CABECA DE VACA. See **NUÑEZ ALVAR.**

CABELL, a co. in s.w. West Virginia, on the Ohio river and the Chesapeake and Ohio railroad, watered by Guyandotte river. It is hilly, but fertile, producing corn, tobacco, etc. Co. seat, Huntington. Area, 300 sq. m. Pop. '90, 23,595.

CABELL, EDWARD CARRINGTON, 1816-96; b. Richmond, Va.; lawyer, educated at the University of Virginia; member of congress from Florida 1845-53; secured appropriation for the fortification of Key West and the Tortugas; served in the confederate army; and wrote a history of Florida.

CABELL, JAMES LAURENCE, 1813-89; b. Nelson co., Va.; physician, graduated at the University of Pennsylvania; studied medicine there, in Baltimore, Philadelphia, and Paris; elected professor of anatomy and surgery in the University of Virginia; in charge of the confederate military hospitals during the civil war; and subsequently was president of the national board of health.

CABEIRI, divinities anciently worshiped in Egypt, Phœnicia, Asia Minor, and Greece. The ancients have left us very obscure notices of the C., and learned men have been unable to reach any satisfactory conclusions with regard to them and their worship. It is certain that the worship had both its mysteries and its orgies, and it appears also that the C. were amongst the inferior divinities, and regarded as dwelling upon the earth, like the Curetes, Corybantes, and Dactyles, and were probably representatives of the powers of nature. See **SAMOTHRACE**.

CABER, TOSSEING the, a Scottish athletic exercise or feat, in which a large beam or young tree, heavier at one end than the other, is held perpendicularly against the chest, small end downward, and tossed so as to fall on the heavy end and turn over, the farthest toss and straightest fall winning. Competitions where the powers of the opponents are unknown are generally started with a caber of 24 or 25 ft., from which the thick end is sawn off by degrees, until the proper length is got at. The thin end, held in the hand, should be not more than 3 ins. in diameter; the average length of a good larch caber is about 21 ft.

CA'BÉS OR **KHABS**, GULF OF (ancient *Syrtis Minor*), an inlet of the Mediterranean sea, lying between the islands of Kerkenna and Jerba, on the n.e. coast of Africa, in lat. about 34° n., and long. from 10° to 11° east. The town of Cabes (ancient *Tacape*) stands at the head of the gulf.

CABET, ÉTIENNE, a notable French communist, was b. at Dijon, Jan. 2, 1788, and educated for the bar, but turned his attention to literature and politics. Under the restoration, he was one of the leaders of the Carbonari (q.v.), and in 1831 was elected deputy for the department of Côte d'Or. Soon afterwards, he published a *History of the July Revolution* (1832), started a radical Sunday paper, *Le Populaire* (1833), and, on account of an article in this paper, was sentenced to two years' imprisonment, but escaped to London. Here he wrote brochures against the July government, and began his communistic studies. After the amnesty, 1839, he returned to Paris, and published a *History of the French Revolution* (4 vols., 1840), bestowing great praise on the old Jacobins. He attracted far more notice by his *Voyage en Icarie* (1840), a "philosophical and social romance," describing a communistic Utopia. The work obtained great popularity among the working-classes of Paris. C. next proceeded to turn "his philosophical romance" into a reality, and published (1847) in his journal, *Le Populaire*, the statutes for the formation of an "Icarian colony" on the Red river in Texas; inviting his followers to emigrate. The first division sailed on the 2d Feb., 1848, but a short experience convinced them that Texas was anything but a Utopia. Their complaints reached Europe, but did not deter C. from embarking at the head of a second band of colonists. On his arrival, he learned that the Mormons had just been expelled from Nauvoo, in Illinois, and that their city was left deserted. The Icarians established themselves there in May, 1850. C. now returned to France, to repel the accusations against his probity which had been circulated during his absence, and to obtain a reversal of the judgment which had been formally pronounced against him, 30th Sept., 1849. Having succeeded in this, he went back to Nauvoo, where he governed, as a sort of dictator, his petty colony, until 1856, when he was deprived of his office, and obliged to flee to St. Louis, where he died 9th Dec. of the same year. C. was a shallow thinker, and a weak ruler.

CABIN, an apartment in a ship for officers or passengers. In a passenger steamer the cabin is divided into state-rooms. In an ordinary merchant ship the cabin is the apartment occupied by the master of the vessel. In a man-of-war it is the quarters of the flag officer and of the commanding officer, the apartments of the other officers being called the ward-room, steerage and warrant-officers' quarters. The word cabin in the English service is synonymous with state-room as used in the United States.

CABINDA, or **KABINDA**, the capital of the Congo district of the province of Angola. Since 1885 it has developed considerably. *Ngayo* is the native name for the country and its people, who are governed locally by petty chiefs, called kings. Cabinda is also the name of the harbor near by.

CABINET (Ital. *gabinetto*), a small chamber set apart for some special purpose, such as the conservation of works of art, antiquities, specimens of natural objects, models, and the like. From signifying the chamber in which such collections are contained, the term C. has recently come to be employed by us, in imitation of the French, to signify the collections themselves, and this even when they fill many rooms or galleries. It often means a small room appended to a larger one, when it is also called an ante-room or retiring-room; and sometimes a small case or frame for the display and preservation of coins, etc.—**CABINET PICTURE**, a picture suited for a cabinet or small room. C. pictures are generally small in size, highly finished, and thus suited for close inspection.

CABINET (see **MINISTRY**), in political affairs, signifies the heads of departments who are the immediate advisers or counselors of the chief executive. In the U. S. government the cabinet consists of the secretaries of state, treasury, war, navy, interior, and agriculture, the attorney-general and the postmaster-general. They meet whenever desired by the president, but not publicly. No minutes are kept of their doings, nor are the names of those present recorded. The president presides; and he may at any time require in writing the opinion of any of the members upon matters concerning his department. But the C. has no responsibility, as that rests with the president alone, and, contrary to the English system, the U. S. C. ministers must not have seats in congress. A list of all the Cabinets in this country to 1892, will be found under **UNITED STATES**.

CABLE is either a large rope, or a chain of iron links, chiefly employed on shipboard to suspend and retain the anchors. Rope cables are made of the best hemp, twisted into a mass of great compactness and strength. The circumference varies from about 3 in. to 26. A certain number of yarns are twisted to form a *lissum*; three lissums are twisted in an opposite direction to form a *strand*; and three strands are twisted (in the same direction as the yarns in a lissum) to form a *cable*. The number of yarns in a C. of given size is not always alike, because the yarns slightly vary in thickness; but the following is one among many tables which have been prepared relating to cables of 120 fathoms, and of the usual degrees of thickness:

Inches Circumference.	Yarns.	Lbs.
3.....	= 48.....	= 192
6.....	= 174.....	= 696
9.....	= 393.....	= 1572
12.....	= 699.....	= 2796
15.....	= 1093.....	= 4372
18.....	= 1574.....	= 6296
20.....	= 1943.....	= 7772

Some cables are made with four strands, but three is the common number. If a C. be twisted too much, it is stiff; if too little, it is weak. The strength of a C. of 18 in. circumference is found to be about 60 tons; and for other dimensions, the strength varies according to the cube of the diameter. On shipboard, cables receive the names of *chief* cables, *bower* cables, etc., according to the anchor to which they are attached. During the great war ending in 1815, the largest ships in the British navy carried ten cables, most of which were about 2 ft. or a little more in circumference. Although ships seldom anchor at a greater depth than 40 fathoms, it is not deemed safe to trust the anchor to one C. of the usual length; two are spliced together at the ends. The hempen cables now made are generally 101 fathoms; but 100 fathoms in practical seamanship denotes "a cable's length," and is really the length of a chain cable.

CHAIN CABLES are made of links, the length of each of which is generally about six diameters of the iron of which it is made, and the breadth about three and a half diameters. In government contracts, chain cables are required to be made in 12½ fathoms lengths, with one swivel in the middle of every alternate length, and one joining-shackle in each length. The stay-pins, to strengthen the links, are of cast iron. The bar or rod from which each link is made, has the two ends cut diagonally; it is bent into the form of a nearly complete oval ring; and then the two ends are joined and welded, the stay-pin being at the same time introduced at the proper place. Besides the ordinary links, there are end-links, joining-shackles, splicing-tails, mooring-swivels, and bending-swivels. The sizes of chain cables are denoted by the thickness of the rod-iron selected for the links. The following table gives certain ascertained quantities concerning the cables in ordinary use:

Thickness of Iron.	Weight of Stay-pin.	Weight per Fathom.	Breaking Strain.
½ inch.	½ oz.	13½ lbs.	6 tons.
1 " "	3½ " "	54 " "	24 " "
1½ " "	12 " "	121 " "	60 " "
2 " "	28 " "	215 " "	99 " "
2½ " "	40 " "	272 " "	126 " "

CABLE, ATLANTIC. See TELEGRAPHY, SUBMARINE.

CABLE, GEORGE WASHINGTON, author, was b. in New Orleans, La., Oct. 12, 1844. Thrown on his own resources while a youth, he earned his living as a clerk, but in 1863 entered the confederate army. At the close of the war he tried different kinds of work, including surveying, but having contracted malarial fever, was an invalid for two years, and during this time contributed some articles to the *New Orleans Picayune*. On recovering his health he became clerk in a cotton house, but some sketches of Creole life, printed in *Scribner's Magazine*, and republished in 1877 as *Old Creole Days*, were received with so much enthusiasm in the literary world that in 1879 he gave up business for authorship, and a few years after settled in Northampton, Mass. His works include *The Grandissimes*, (1880); *Madame Delphine* (1881); *Dr. Sevier* (1883); *The Creoles of Louisiana* (1884); *The Silent South* (1885); *Bonaventure* (1888); *Strange True Stories of Louisiana* (1890); *John March, Southerner* (1894). As a public reader, a lecturer and writer on prison reform and on Sunday school work, he was highly successful. He became editor of *Current Literature*, New York, in 1896.

CABLE-MOLDING, in architecture, is a molding cut in the form of a rope, the twisting being prominently shown. It was much used in the later Norman style.

CABLING, the molding by which the hollow parts in the flutes of columns and pilasters in classical architecture are often partially filled. The C. seldom extends beyond the third part of the shaft from the ground.

CABOCHED, or **CABOSSED**, an heraldic term, from the old French word *caboche*, the head. When the head of an animal is borne, without any part of the neck, and exhibited full in face, it is said to be caboched.

CABOCHIENS, certain butchers of Paris, named from their chief, Jean Caboche, who were partisans of John of Burgundy against the Armagnacs. In 1418, their outbreaks provoked the people of Paris to rise against them.

CABOOSE, or **CAMBOOSE** (Danish, *kabyse*, a cook's room in a ship; Ger. *kabuse*, a little room), is the name of the kitchen or cook-room in a merchant-ship. In coasting-vessels, the term is applied to a portable cast-iron stove on the deck, where food is cooked.

CABOT, the name of two Venetians, father and son, both celebrated as navigators and discoverers.—GIOVANNI CABOT, or CABOTTO, the father, whose business compelled him to reside much in Bristol, was appointed by Henry VII., Mar. 5, 1496, to the command of a squadron of five vessels on a voyage of discovery in the Atlantic ocean. In this expedition he was accompanied by his sons Ludovico, Sebastiano (born at Bristol, 1477), and Sanzio. On the 24th of June, 1497, the coast of Labrador, North America, was sighted. The merit of this discovery has been generally ascribed to the navigator's second son, Sebastian C., the most scientific of the family; but an extract from a chart preserved by Hakluyt mentions the father before the son. The expedition returned in Aug., 1497. In 1498, a second was made, with what results we do not know; and in 1499, a third to the gulf of Mexico. About this time, Giovanni, the father, appears to have died, and we hear no more of *Sebastian* till 1512, when he entered the service of Ferdinand, king of Spain. During the year 1515, he was engaged in revising maps and charts in connection with his profession, and in planning an exploration of the n.w. passage to Asia, which, however, was laid aside on account of the death of Ferdinand in 1516. C., who seems to have been no favorite with the Spanish courtiers, was now subjected to a series of contemptible insults. This usage induced him to return to England, and in 1517, he was appointed by Henry VIII. to the command of an expedition to Labrador. He reached lat. 67½° n., and entered Hudson's bay, where he gave names to several places; but the expedition proved on the whole a failure, on account of the cowardice or malice of his vice-commandant, sir Thomas Perte. C. now entered again into the Spanish service, was made pilot-major of the kingdom by Charles V., and commanded an expedition which examined the coast of Brazil and La Plata, which he attempted to colonize. In 1531, he returned to Spain, and resumed his old situation; but in 1548, he once more betook himself to England, where he was well received by king Edward VI., who made him inspector of the navy, and gave him a pension. To this monarch he seems to have explained the variation of the magnetic needle in several places, which he was among the first, if not the very first, to notice particularly. In 1553, C. was the prime mover and director of the expedition of merchant adventurers which opened to England an important commerce with Russia. He died in London in 1557. See HARRISSE'S *Jean et Sébastien Cabot* (1882).

CABOT, GEORGE, 1751-1823; b. Mass.; in early life a ship captain, but in 1776 chosen to the Massachusetts provincial congress. He was also in the state constitutional convention, and in 1789 was chosen U. S. senator. He was offered but declined the position of secretary of the navy. His last political act was to preside over the Hartford convention in 1814.

CABOTVILLE. See CHICOPEE.

CABOTZ. See CUSO.

CABRAL, or **CABRERA**, PEDRO ALVAREZ, b. abt. 1460; discoverer of Brazil, descended from an old and patrician Portuguese family. Nothing is known of his early life, save the fact that he must have recommended himself by talent and enterprise to king Emanuel of Portugal, who, after the first voyage of Vasco da Gama, appointed C. to the command of a fleet of 13 vessels, carrying 1200 men, and bound for the East Indies. On the 9th Mar., 1500, he sailed from Lisbon. To avoid the inconvenience of being becalmed on the coast of Africa, he took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which he claimed possession for the king of Portugal, April 22, 1500, naming the new country "Terra da Santa Cruz." After sending home one vessel to bear news of this great accidental discovery, C. sailed for India; but on the 29th of May, four of his vessels foundered, and all on board perished, including Diaz, the great navigator; and soon afterwards three more vessels were lost. C. therefore landed at Mozambique, on the e. coast of Africa, of which he first gave clear information, and also discovered (Aug. 23) the Antschedives Islands, of which he described correctly the position. Hence he sailed to *Calicut*, where, having made the terror of his arms felt, he was permitted to found a factory; entered into successful negotiations with native rulers, and thus established the first commercial treaty between Portugal and India. He returned from India, bringing with him a considerable booty, and arrived in the port of Lisbon, July 23, 1501. It appears probable that the king was dissatisfied with the results of the expedition (although it had annexed Brazil to the crown of Portugal), for subsequently we find no mention made of C. among other discoverers. At the request of C., Sancho de Toar wrote a description of the coast of Sofala. See *Descobrimento do Brasil*, by Capistrano de Abreu (1883); also *Decadas das Indias* by Barros.

CABRE'RA, a small island in the Mediterranean, lying off the southern point of Majorca. It is about 3 m. in length and breadth, with an irregular coast, and is little else than a barren calcareous rock. The only interest attached to C. is, that during the war in the Peninsula it formed a Spanish depot for French prisoners, who were crowded in thousands into the desolate spot, and treated with great barbarity; of which an account is given in a popular work, entitled the *Adventures of a French Sergeant*.

CABRE'RA, DON RAMON, the boldest leader of the Carlist party in Spain, was b. at Tortosa, in Catalonia, 31st Aug., 1810. The death of Ferdinand, in 1833, gave the signal for a civil war, and first brought C. into notice. Placing himself at the head of some guerilla troops, he joined the absolutists, or partisans of Don Carlos, and by his vigilance, energy, and daring soon rose to be second in command in the Maestrazgo district. Throughout Aragon and Valencia his name became a by-word for cruelty. After penetrating as far s. as Andalusia, his forces were completely routed by the royal troops, on the borders of Aragon, and he himself, severely wounded, escaped with difficulty into the woods. It was now rumored that C. was dead, when all at once he reappeared at the head of 10,000 foot and 1600 horse. Invading the province of Valencia, he overthrew the royal army at Buñol, 18th Feb., 1837, and again on the 19th Mar. at Burjasot; but was in his turn vanquished at Torre Blanca, and once more compelled to seek a hiding-place. Shortly after, he reopened the war with fiery energy. Madrid itself was threatened by C., who, about this time, received the title of count of Morella for his vigorous defense of the fortress of that name, and was also appointed governor-general of Aragon, Valencia, and Murcia. The Carlists now believed that the triumph of absolutism was approaching, when the treachery of the Carlist gen., Marotto, changed the whole aspect of affairs, and Don Carlos fled from Spain. C. held out until Espartero forced him to quit the country in the summer of 1840. He then entered France, where he was taken prisoner, and confined for a short time in the fortress of Ham. In 1845, he strongly opposed Don Carlos's abdication of his rights. On the outbreak of the French revolution in 1848, he renewed the struggle on behalf of absolutism in Spain; but the adventure proved a miserable failure, and on the 17th Jan., 1849, he recrossed the Pyrenees, to live in retirement. He afterwards married a wealthy English lady, Miss Marianne Catherine Richards. When Alphonso was proclaimed king of Spain in 1875, C. advised the Carlists to submit to him, chiefly because he was "a good son of the church." He died 24th May, 1877.

CABUL', a river in Afghanistan, rises in lat. 34° 21' n., and long. 68° 20' e., on the southern declivities of the Hindu Kush or Indian Caucasus. Its source is 8400 ft. above the level of the sea; and an eastward run of 320 m., with a fall of about 7500 ft., along n. Afghanistan, through the Khyber mountains, and across Peshawur, carries it into the Indus, opposite to Attock, in the Punjab. The point of confluence marks the head of navigation on the main stream, while the tributary itself is practicable about 50 m. upwards for craft of 40 or 50 tons. By means, therefore, of the two taken as one line, there exists an available communication of about 1000 m. between the Khyber mountains and the Indian ocean. The C. washes the cities of Cabul, Jelalabad, and Dabundee.

CABUL' is the name given to that part of Afghanistan (q.v.) which lies s. of the Hindu Kush, and is drained by the Cabul river. It extends from the s. of Ghiznee to the Hindu Kush, and from Bamian (q.v.) to the Khyber pass. This region has long occupied a prominent position in the world. Through it, as the passage from Persia to India, Alexander the great marched to complete his eastern conquests; from it issued

Mahmoud of Ghiznee, the first Mohammedan invader of Hindustan.

The city of Cabul, from which the surrounding territory takes its name, has about 70,000 inhabitants, and stands in lat. $34^{\circ} 30'$ n., and long. $69^{\circ} 6'$ e., near the point where the river, here crossed by three bridges, ceases to be fordable. Elevated about 6400 ft., and overtopped, within a short distance to the n., by pinnacles of the Hindu Kush, about 14,000 ft. higher than itself, C. has a severe winter, and a temperate summer, ranging from 75° to 85° F. On the outskirts of the city are extensive machine shops, including a plant for electric light, and a rifle and cartridge factory. This is connected by rail with a marble quarry about 10 miles distant. The water supply of the city is abundant, and generally good. The streets are badly paved, and the houses, which are generally only two or three stories high, are built of sun-dried bricks and wood, and have flat roofs. Near the outer edge of the city are the tombs of the sultan Babar. Formerly the city was enclosed by an earthen wall. The inhabitants are Mohammedans of the Sunni sect, they are not very dark in color, are strong, well-built and have a Jewish cast of countenance. The language of the common people is the Pushtu dialect, but the higher classes speak the Persian language. The city has considerable commercial importance and it is regarded as a very important strategic point. In the days of sultan Babar, C. was the capital of the Mogul empire. In more recent times it has witnessed some of the most momentous events in Anglo-Indian history. In 1839 it was taken by the British; in 1841 it was lost through a treacherous outbreak, which led (6th Jan., 1842) to the massacre of about 4000 soldiers and 12,000 followers; and, finally, after being recovered by gen. Pollock in the same year, it was abandoned, its bazars and public buildings having previously been burned to the ground.

After the death of Dost Mohammed, ameer of Afghanistan, Shere Ali, the son whom he had selected as his heir, had to fight for the possession of C. with Afzul Khan, his elder brother, and the son of the latter, Abdulrahman, who had married a daughter of the khan of Bokhara. Shere Ali was at first unsuccessful. On May 21, 1866, Afzul entered C. in triumph, and was proclaimed ameer of Afghanistan. He applied to sir John Lawrence, the Indian viceroy, to recognize him, but the request was declined on the ground that Shere Ali remained in possession of a large part of Afghanistan. At the death of Afzul his brother Azim took the title of ameer, not of Afghanistan, but of C. and Candahar. In the end of 1868, Shere Ali, aided by his son Yakooob, obtained possession of C., which became again the capital of Afghanistan. At the close of the war of 1878-79, Yakooob, ameer of Afghanistan, agreed that there should be an English resident at Cabul. War recommencing, Yakooob abdicated, and Abdurrahman, son of Afzul, became ameer.

CACA'O. See COCOA.

CACCA'MO, a t. in the province of Palermo, Sicily, about 6 m. s. w. of Termini, with a pop. of 8000.

CACCIA (Italian), music accompanied by horns. *Alla caccia*, in the hunting style.

CA' CERES, a t. of Spain, capital of the new province of Caceres, is situated on a river of the same name, about 25 m. w. of Truxillo, in a rich agricultural district. It is famous for its bacon; has manufactures of linen, woollens, leather, hats, soap, etc.; dye-works and flour-mills, and a large trade in the produce of the district. It is the *Castra Cacciliv* of the Romans, and many relics of its antiquity are still found. It is rich in architecture of the feudal period, and has one of the largest and finest bull-rings in Spain. Pop. 14,900.

CA' CERES, NUE'VA, a t. of the Philippines, in the province of South Camarines, on the island of Luzon. It is situated on the river Naga, or Santa Cruz, between the bay of San Miguel and the gulf of Ragay, about 175 m. s.e. of Manila. Pop. 9300.

CACERES, ANDRES AVELINO, Peruvian statesman and soldier, born at Ayacucho in 1838. He fought in the Chilean war (1879-1883), in which he was raised to the rank of general. After the capture of Lima he became vice-president in the provisional government, and later, when the president, Calderon, fell into the hands of the Chileans, Caceres became the head of the government. He refused to acknowledge the supremacy of the Chileans and held out against them for some time. In 1884 in trying to dislodge Iglesias, whom the Chileans had set up as president, he was repulsed before Lima, but having gathered a larger force he entered the city in the following year, and induced the president to refer the presidential question to a popular election. The result was favorable to Caceres, who was chosen president and inaugurated in June, 1886. In 1890 he was succeeded by Bermudez, and went soon afterward as Peruvian minister to Great Britain. In 1894 he was re-elected president.

CACHAR', NORTH, and **CACHAR PLAINS**, districts in the chief commissionership of Assam, British India, having an area of 1728 and 2472 square miles, respectively.

CACHE (Fr. a lurking-hole), the name given by parties of travelers in the great western prairies of the United States to places for concealing provisions and other articles. Designing to return on their tracks after crossing the Rocky mountains, they disburden themselves of what articles can be spared, and, to conceal them from the Indians, construct places of deposit in the wilderness. The making of a C. is a matter of much labor and ingenuity. A hole is dug to a depth of perhaps 6 or 8 ft. and several feet broad, and then the articles being interred, the surface is replaced with the utmost possible care. The excavated earth is also carefully removed, so as to leave no trace whatever of the excavation. The situation of the C., however, is known to the party by some landmark, and returning months afterwards, they probably find its contents undisturbed. If containing provisions, the cache needs to be made to resist the depredations of animals, hence it is often covered with rocks.

CACHE, a co. in n.e. Utah, on the Idaho frontier, and the Union Pacific railroad, watered by Bear river; 1090 sq. m.; pop. '90, 15,509. Productions agricultural. Co. seat, Logan.

CACHE'O, or **CACHEU**, a t. in Senegambia, w. Africa, in the land of the Papels, a few miles from the mouth of San Domingo or Cachoia river. It is a Portuguese fortified post, and has trade in ivory and gold dust.

CACHET, **LETTRES DE**. See **LETTRES DE CACHET**.

CACHE XIA, a name applied by physicians sometimes to a group of diseases, and sometimes to the constitutional state accompanying a particular disease—e.g., cancerous C., gouty C., mercurial cachexia. The word is derived from the Greek *kakos*, bad, and *hexis*, a habit, and signifies simply a *bad habit of body*, without reference to the cause of illness. From Cullen's having in modern times given extensive circulation to the word, as indicating a large group of chronic diseases, in most of which there are complicated changes in the blood and in the solid textures, C. has come to be chiefly employed with reference to diseases in which the general nutrition of the body is at fault, and in which the local disorders are supposed to be the result of a constitutional cause. Thus, cancerous C. indicates the peculiar impoverished state of the blood and general debility which are associated with the deposits of cancer in various parts of the body; gouty C., the state of the general system in gout, as opposed to the mere local attack of gout in the foot, etc. The cachexiæ differ from the fevers in being much slower in development, and, for the most part, in having no natural termination at a fixed period. See **CRISIS**.

CACHICAMA, or **TATOU-PEBA**, *Dasyurus novem-cinctus*, an armadillo in tropical America, covered with horny plates. It is about 1¼ ft. long, harmless, and easily tamed. Its food is ants and other insects.

CACHOEIRA, or **CAXOEIRA**, a t. in Brazil, in the province of Bahia, and 57 m. n.w. of the city of Bahia. Its trade is in tobacco, coffee, and sugar. Population with that of São Felix is estimated at 20,000.

CACHOLONG, a beautiful mineral, regarded as a variety of opal (q.v.). It is sometimes called pearl opal, or mother-of-pearl opal. It is generally of a milk-white color, rarely with a yellowish or reddish tinge, opaque and dull or pearly and shining, and has a flat conchoidal fracture. Among the localities in which C. is found are the Giants' Causeway and the Farøe islands.

CACHOLOT, **CACHALOT**, **SPERMACETI WHALE**, or **SPERM WHALE**, *Physeter macrocephalus* or *catodon macrocephalus*, one of the largest of the *cetacea* (q.v.), very peculiar in form and appearance, much sought after not only on account of the oil, but still more on account of the spermaceti (q.v.) which it yields. Ambergris (q.v.) is also obtained from it. The C. belongs to the family of *cetacea* called *physeteridae*, or *catodontidae*, of which some naturalists still think that there is only one well-ascertained species. There appears, however, to be pretty good reason for thinking that at least two species exist, both of which are occasional visitants of the British shores—the common C., having no dorsal fin, and the high-finned C. (*physeter tursio*) having a very high dorsal fin. The common C. has a very wide geographical range. It may almost be said to inhabit all seas, although it is most abundant in those of the southern hemisphere. It is not of frequent occurrence on the European shores, although it sometimes enters the Mediterranean, and is occasionally stranded on the coasts of Britain. An individual, 54 ft. long and 30 in circumference, ran ashore on Cramond island, in the firth of Forth, in 1769, and was very particularly described in the *Philosophical Transactions* by Mr. Robertson of Edinburgh. Twelve were caught at Walderwich, on the English coast, in 1788. The C. sometimes reaches the length of 70 or 80 feet. The head is enormously large, forming about one half of the entire bulk of the animal, and occupying more than one third of the entire length. From the head, the body tapers to the tail, and at last rather rapidly. The general color is very dark gray, nearly black on the upper parts, lighter beneath. Old males, or, in the language of the South Sea whalers, old bull-whales, usually have a large gray spot on the front of the head. The muzzle is very obtuse, almost as if suddenly cut off in front, the breadth of it almost equaling the thickness of the body. In a protuberance on the upper part of it, is the blow-hole, which is single, situated a little on the left side, and in form not unlike the letter S elongated. The mouth is very large and wide; and the throat, unlike that of the Greenland whale, is very wide, sufficiently so to admit the body of a man. The upper jaw projects some feet beyond the lower, and is destitute both of teeth and whalebone; the lower jaw has from 20 to 25 teeth on each side, according to the age of the animal. The teeth are conical and slightly recurved, projecting about 2 in. from the gum. The lower jaw is extremely narrow, the two branches being in contact throughout the greater part of its length: it fits into a groove in the upper, in which are cavities for the teeth. The eyes are small, and placed far back in the head, above the angles of the mouth; the left eye is said to be smaller than the right. Just above the eyes, the dorsal line rises considerably; the dorsal fin is also represented by a protuberance about half-way between the neck and the tail; and these parts are seen above water in the ordinary swimming of the animal, which is at the rate of from 3 to 7 m. an hour, and just under the surface of the water, although when alarmed it swims with greater velocity, strik-

ing the water upward and downward with its tail with great force. The pectoral fins are small, and seem scarcely if at all to aid in progression, which is accomplished by the large and powerful tail-fin. The tail-fin is very broad, and is divided into two lobes, called by South Sea whalers *the flukes*.

The enormous head of the C. is in great part occupied by a cavity in front of and above the skull, called by whalers *the case*, which is a receptacle for spermaceti (q.v.). This substance being light, it is not wonderful that the animal in swimming raises its head above the surface of the water, which it also often does even when at rest, "like a black rock in the ocean." The *case* frequently holds as much as ten large barrels of spermaceti. It is not formed of bone, but of a strong tendinous integument, and is divided into compartments communicating with each other. The substance which it contains is in a semi-fluid state, but hardens on cooling: it consists of spermaceti and oil; the oil is separated by draining and squeezing, and the spermaceti further purified, till, instead of being a yellow unctuous mass, in which state it is brought home by the whalers, it assumes a beautiful pearly white, flaky, almost crystalline appearance. When the spermaceti whale is killed, and towed alongside the whaling-ship, the *case* is emptied of its valuable contents through a hole made in front of the muzzle, and by means of a bucket attached to a pole. The spermaceti was at one time imagined to be the brain of the whale; what purpose it serves in the animal economy, is not well known, except that already alluded to of giving buoyancy to the forepart of the huge body; and perhaps this is its chief use, respiration even more than progression depending on it; but it is distinct enough from the brain, which is comparatively very small, and is indeed, as well as the skull which contains it, small in proportion to the whole bulk of the creature. Cavities filled with spermaceti are distributed over the body, and even ramify through the external fat or blubber, although the principal mass is in the head. The blubber of the C. is not nearly equal in thickness to that of the Greenland whale, being only about 14 in. thick on the breast of a large whale, and from 8 to 11 in. on other parts of the body. It is called by whalers the *blanket*, is removed from the body of the captured whale in great strips, and is heated in large pots, the skin of the whale serving for fuel, when the oil known as sperm oil (q.v.) flows from it. The *junk*, a thick elastic mass, which occupies the forepart of the head, immediately under the *case*, yields also a considerable quantity of sperm oil. See WHALE.

CACHUCHA, an Andalusian dance of much grace. Its origin is unknown. It is written in 3-4 time, and resembles the *Bolero* (q.v.). The cachucha is usually danced with castanets. It was introduced on the stage by Fanny Ellsler in the ballet of *Le diable boiteux*.

CACIQUE', or **CAZIQUE'**, the designation given to the chiefs of Indian tribes in works relating to the central and southern parts of America. The word was derived by the Spaniards from the language of the former inhabitants of St. Domingo.

CACODÆMON. See DEMONS.

CA'CODYLE, or **KA'KODYLE**, is an organic substance containing carbon, hydrogen, and arsenic, C_4H_4As . It has been proposed to employ the oxide of C. (C_4H_4AsO) as a deadly agent in war. This compound, otherwise known as *Cadet's fuming liquor* or *alkarsine*, has the remarkable property of taking fire spontaneously when exposed to the air, and evolving abundant fumes of arsenic.

CACOGRAPHY (Gk. *kakos*, "bad;" *graphie*, "writing"), bad writing, or handwriting, opposed to *calligraphy*; incorrect spelling, or a bad system of spelling, such as that of the current English. In this use the term is opposed to *orthography*.

CACON'GO, or **MALLEM'BA**, an independent state of s. Guinea, Africa, extending along the s. Atlantic ocean, in lat. 5° s., and stretching s.e. as far as the river Bell. Its limits interiorly are not well defined. The country is generally flat, and the soil fertile. The principal towns are Kinguele, and Cacongo and Mallemba on the coast, the last once a great mart for slaves.

CACOPHONY (Gk. *kakos*, "bad," *phōne*, "sound"), as a term of rhetoric, denotes an unsmooth or disagreeable sound of words, caused by the concurrence of harsh letters or syllables. As a musical term, it signifies a combination of discordant sounds, and so is opposed to harmony. In medicine also the word has been in use to denote a harsh or discordant state of the voice.

CAC'TEÆ, or **CACTA'CEÆ**, a natural order of exogenous plants, consisting of succulent shrubs of very singular appearance. Linnaeus included all the C. in the single genus *cactus*, which is now divided into a number of genera; the name *cactus*, however, still continuing in popular use, common to the whole order. Nearly 500 species are known, but the real number is probably much greater. The C. are, without exception, natives of America, and their extraordinary forms constitute a remarkable feature in the vegetation of its warmer regions. All of them have fleshy stems, either simple or branched, often very soft and juicy; but in many, at least when old, having an easily distinguished woody axis, composed of annual rings, and covered with a layer of inner bark, so that the thick fleshy part may be regarded only as a layer of bark. Most of them are leafless; the *pereskia* alone have true leaves, which are fleshy; and the *opuntias* have rudimentary leaves, which soon fall off; but, instead of leaves, most of the order have clusters of hairs or prickles, where buds are formed in their stems, and these are

very numerous, even in the species which in ordinary circumstances most rarely develop branches. The multiplicity of curious forms exceeds imagination; in many species (*meloactidae*, or melon thistles), the stem swells out into a globe; in others (*torch thistles*), it rises up as a column with many angles; in others (*opuntia*, Indian figs, or prickly pears), it divides in leaf-like articulations; in some (*pereskia*) it assumes a tree-like form, in which the thick stem bears a head of branches, and reaches a considerable height, sometimes even 30 or 40 feet. Those which have angular, ribbed, and channeled, or flat and two-edged stems, show a tendency to the cylindrical form as the stem advances in age. Some species have long creeping or trailing stems. The whole organization of the C. adapts them for the endurance of long droughts; they vegetate vigorously during a part of the year, and then rest; the very absence of leaves concurring with the absence of pores or *stomata* in their tough skin to enable them to resist the action of a dry atmosphere and powerful sunshine, and to occupy arid soils and bare rocks, on which they are very generally found, often covering large tracts. Some of them grow rapidly on old lavas, and disintegrate them by their penetrating roots, thus preparing a soil for other plants; and the prickly pear is often planted in Sicily by the mere insertion of a branch or joint of it in a fissure of lava. Many species occur as *epiphytes* (q.v.) on the trees of American forests. Some also grow on high mountains, a few even reaching almost to the border of the snow. The plants of this order are a great boon to the regions in which they chiefly abound, which are, at least during great part of the year, very destitute of water; their stems containing a store of insipid and wholesome juice, of which both men and cattle avail themselves.—Some species, as the prickly pear (q.v.), produce a pleasant fruit.—The fruit of *opuntia tuna* affords a valuable pigment of the richest carmine color.

The flowers of the C. are in general very short-lived; those of some night-flowering species, as of *cereus grandiflorus*, well known in our hothouses, endure only for part of a single night. In the greater number, they are large and splendidly colored, in some they are very fragrant. The order is regarded as botanically allied to *mesembryaceæ* (q.v.) and to *grossulariaceæ* (q.v., gooseberry, currant, etc.).

The cultivation of the C. in green houses and hothouses has been much in fashion for more than 30 years. The gardener must imitate the natural conditions of their growth, by giving water freely during a few months, and withholding it almost entirely during the rest of the year. Most of them are easily propagated by branches, taken off, and allowed to dry a little before being planted. The *meloactidae*, which do not readily produce branches, are made to do so by cutting off or burning out the central bud, that the means of propagating them may be obtained.

CACTUS. See **CACTEÆ.**

CACUS, in legend, a gigantic son of Vulcan, who dwelt in a cave on mount Aventine and continually vomited fire and smoke. He stole cattle from the people and drew them backward into his cave, so that their tracks would not point to his abode. He was slain by Hercules for stealing the cattle of Geryon.

CADAM'BA, or **KUDUMBA**, the wood of several species of *nauclea*, a genus of trees of the natural order *cinchonaceæ*, natives of the East Indies, having flowers with a funnel-shaped corolla. *N. cadamba* is a noble tree, with orange-colored fragrant flowers, collected in heads about the size of a small apple. The leaves are from 6 to 10 in. long. The wood is yellow, soft, and fine-grained. The tree is highly prized for the shade which it affords; the wood is used for various purposes. *N. cordifolia* is a large tree, plentiful in mountainous districts of Hindustan; the wood yellow, close-grained, and used for flooring-planks, packing-boxes, and many other purposes, as is also that of *N. parviflora*. All kinds of C. wood are, however, liable to be injured by moisture, and can only be used where they are to be kept dry.

CADA MOSTO, **LUIGI DA**, 1432-80; a Venetian navigator, who, with others, in 1455, explored the w. coast of Africa as far south as the river Gambia. He wrote an account of his voyages in the *Book of the First Voyage over the Ocean to the Land of Negroes in Lower Ethiopia*.

CADASTRAL SURVEY is one which represents objects in their true relative positions and dimensions, as they exist on the face of the country, differing thus from a topographical survey, which, for distinctness, enlarges certain objects, as the dimensions of houses, width of roads, streams, etc. The usual scale of a map of C. S. is about 2 ft. to a mile.

CAD DICE, or **CAD'DICE-FLY** (*phryganea*), a Linnæan genus of insects of the order *neuroptera*, a family in subsequent entomological systems, and constituted by Mr. Kirby into a distinct order, *trichoptera* (Gr. hairy-winged). The caddice-flies certainly differ in important particulars from the other neuropterous insects, and exhibit points of resemblance to the *lepidoptera*. They have no mandibles, and the maxillæ and lower lip are membranous and united; the head is small, with prominent eyes, and two additional small simple eyes situated on the forehead; the antennæ are long and bristle-like, composed of very numerous indistinct joints. Both wings and body are generally very hairy, and the wings, when at rest, are raised, and meet above the back like those of butterflies, from which, however, they differ very much in form, being much more

elongate: the legs are long. Caddice-flies are extremely active, particularly in the evening and at night, when the smaller species often fly in great numbers above streams and ponds. These insects are most interesting, however, on account of their larvæ, of which the larger kinds are the well-known *caddice-worms*, or *cad-bait* of anglers. They are of a long, almost cylindrical form, the head and first three segments hard, the remainder—the abdominal segments—soft. To the thoracic segments are attached the feet, six in number, as in the perfect insect. The larva lives always in water, feeding on aquatic vegetables. It spins by its mouth silken threads, by means of which, together with a viscid substance, it attaches together—and often in a very symmetrical manner, and with interesting peculiarities which differ in the different species—small hard substances, such as small stones, bits of stick, or small shells, even although they happen to contain living inmates, and thus constructs a case for itself, in which its soft body is protected, and from which only the head and hard thoracic segments are voluntarily protruded. When it changes into the pupa state, in which it differs little from the perfect insect, except in the imperfectly developed wings, it fixes its case to some solid substance beneath the water, and closes the two extremities with a kind of grating, which admits the free passage of water, necessary for respiration. Before assuming the perfect form, the pupa of the larger species breaks out of its case by means of a pair of hooks on the forepart of the head, and swims actively by means of the hind legs, or crawls by the other two pair. Many of the smaller species bring their pupa case to the surface of the water, and there take wing from it as from a boat. The species of caddice-fly are very numerous, and they are said to be more so in the n. than in the s. of Europe. Many American species have been described.—The angler looks for cad-bait about the edges of streams and under stones, or on the stalks of water-cresses, and other aquatic plants. As a bait for angling, the caddice is almost as deadly as the May-fly, and more so, in clear running streams, than the ordinary worm; the usual-sized bait-hook is used, upon which two of the baits are fixed, the angler proceeding exactly as in ordinary worm-fishing.

CADDO, a parish in n.w. Louisiana, bordering on Arkansas and Texas; 825 sq.m.; pop. '90, 31,555, includ. colored. Productions, corn, cotton, sweet potatoes, etc. The Texas Pacific railroad passes through the parish. Principal town, Shreveport.

CADDOES, or **CADODAQUIOS**, Indians in or near Texas on the upper Red river and lake Caddo. There are but a few hundreds left of a once large tribe.

CADE, JACK, a historical character, leader of an insurrection in Kent, England, June, 1450. Little is known of his personal history, further than that he was an Irishman, and an illegitimate relation of the Duke of York, and hence called himself Mortimer. With 15,000 or 20,000 armed men of Kent, C. marched on London, and encamped at Blackheath, whence he kept up a correspondence with the citizens, many of whom were favorable to his enterprise. The court sent to inquire why the good men of Kent had left their homes; C., in a paper entitled "The Complaint of the Commons of Kent," replied that the people were robbed of their goods for the king's use; that mean and corrupt persons, who plundered and oppressed the commons, filled the high offices at court; that it was "noised that the king's lands in France had been aliened;" that misgovernment had banished justice and prosperity from the land; and that the men of Kent were especially ill-treated and overtaxed, and that the free election of knights of their shire had been hindered. In another paper, called "The Requests by the Captain of the Great Assembly in Kent," C. demanded that the king should resume the grants of the crown, which he complained the creatures about the royal person fattened on, the king thus being compelled to live on taxation; that the false progeny of the duke of Suffolk should be dismissed; and that the duke of York and others should be restored to favor, and a number of persons punished. The court sent its answer in the form of an army, before which C. retreated to Sevenoaks, where he awaited the attack of a detachment, which he defeated. The royal army now objected to fight against their countrymen; the court made some concessions, and C. entered London on the 3d July. For two days, he maintained the strictest order; but he forced the mayor and judges to pass judgment upon lord Say, one of the king's hated favorites, whose head C.'s men immediately cut off in Cheapside. On the third day, some houses were plundered, the leader himself, it is said, setting the example. C., who at night lodged his army in the borough, got news that the citizens intended to prevent his entrance into the city on the morrow, and in the night he made an attack on the bridge, but was defeated. A promise of pardon now sowed dissension among his followers, who dispersed, and a price was set upon C.'s head. He attempted to reach the Sussex coast, but was followed by an esquire, named Alexander Iden, who fought and killed him, July 11. His head was stuck upon London Bridge, as a terror to traitors.

CADELLE, *trogosita mauritanica* or *caraboides*, an insect sometimes found in granaries in Britain, but seemingly imported from more southerly countries, where, as in France, its larvæ often commit great ravages among stored corn. They also live on bread, almonds, and even rotten wood. When full grown, they are about $\frac{1}{2}$ of an in. long, flattened, fleshy, rough with scattered hairs, whitish, tapering towards the head; which is black, horny, and furnished with two curved jaws. The perfect insect is a glossy beetle of a deep chestnut color, marked with dotted lines. It belongs to the

family of *xylophagi*, of the order of *coleoptera* (q.v.), section *tetramera*. The name *C.* is French.

CADENCE, a term in music, corresponding to the full stop in language. At the end of a movement, or work, a succession of chords generally follows one after another to bring it to a conclusion. These usually produce a feeling of expectation, or suspense, until the chord of the tonic is given to satisfy the ear. Some authorities define a number of cadences, but they are commonly divided into three kinds: the Perfect, the Imperfect, and the Interrupted cadences. In the first, the progress is usually made from the dominant to the tonic, since the dominant chord contains the notes which are most remote in their relation to the tonic. The Perfect Cadence in ancient church music was divided into two forms—the Authentic and the Plagal—which are sometimes used in modern music to express a sentimental or romantic idea. The Imperfect Cadence is the reverse of the Perfect, in which the tonic chord precedes the dominant, leaving the ear unsatisfied, although the effect of a stop is produced. The Imperfect Cadence is sometimes aptly termed the half-close. It corresponds in a way to the colon, or semicolon. In the Interrupted Cadence the chord of the dominant, instead of proceeding directly to the tonic, is followed by the chord of the sixth note in the key—the submediant; but this can only be distinguished from the Imperfect by referring to the context; for, instead of bringing the musical idea to a definite stop, it keeps postponing the termination or evading it altogether. There are many subordinate cadences in the course of a movement, especially in modern music, which has a tendency to avoid full cadences, and to vary them as much as possible when the nature of the work demands their use.

CADENCY (from Lat. *cado*, to fall or decline). The marks by which the shields of the younger members of families are distinguished from those of the elder, and from each other, is an extensive, and, in so far as that term can be applied to heraldry at all, an important branch of the science. No distinction is usually made by writers on heraldry, and probably the practice of heralds in general scarcely admits of any being made, between marks of *C.*, *differences*, *distinctions*, or even *brisures*, though the last term is pretty constantly and quite appropriately used to include not only differences in general, but also abatements (q.v.) or bearings by which the arms of the family are broken or diminished. See **BASTARD BAR**. But there is a manifest convenience in the practice which is usually followed in Scotland, of appropriating the label, the crescent, the mullet, and the rest of the series of marks, commonly known as marks of *C.*, to the purpose of distinguishing the sons from the father, and from each other, during the father's life-time.

CADENZA, in music, an ornamental succession of notes introduced at pleasure by the performer at the finishing of a phrase.

CADER IDRIS (chair of Idris, a reputed giant), a picturesque mountain in Merionethshire, Wales, 5 m. s.s.w. of Dolgelly. It consists of an immense ridge of broken precipices, 10 m. long, and 1 to 3 m. broad; the highest peak reaching an elevation of 2914 feet. It is composed of basalt, porphyry, and other trap rocks.

CADET, MILITARY (Fr. *cadet*, younger, junior in service—allied in derivation and meaning to cadency (q.v.) in heraldry), is a term applied in a general sense to a junior member of a noble family as distinguished from the eldest; and in France, any officer junior to another is a cadet in respect to him. In a strict military sense, however, a cadet is a youth studying for the public service. In the United States the military cadets are the students at the West Point Military academy, who pursue a four years' course of study preparatory to receiving their commissions as officers in the army. They are appointed, one from each congressional district, by the secretary of war, upon the recommendation of the congressmen of the respective districts, who generally make the selection by competitive examinations for determining the relative merits of applicants; one from each territory and from the District of Columbia; and ten at large by the President. In England, military cadetship has presented two aspects, according as it is related to the East India company's or to the royal service. The former underwent various modifications by the introduction of competition in the appointments, and by the transference of the company's power to the crown, and ceased in 1861, when the accession of fresh officers to the local Indian armies was stopped. The second aspect of military cadetship, that of the royal or queen's cadets, will be noticed under the titles, **SANDHURST COLLEGE**, **STAFF COLLEGE**, and **MILITARY ACADEMY, ROYAL**. For a further description of United States Cadets, see **WEST POINT** and **UNITED STATES MILITARY ACADEMY**.

CADET, NAVAL, a youth pursuing a course of study at some public institution provided for the purpose, with the end of fitting himself for entering the navy; in the United States a student at the Naval Academy at Annapolis, appointed in the same manner as a military cadet (q.v.), and required to remain under instruction for a period of six years, four of which are spent at the academy, and two at sea. Candidates for admission must be between the ages of fourteen and eighteen, in sound physical condition and with evidence of good moral standing, and must pass satisfactory examinations in algebra, arithmetic, English grammar, United States history, geography, writing and spelling. In England the cadets enter the service at 12 to 15½ years of age. Every captain, on being appointed to a ship in commission, is allowed to nominate one cadet;

every flag officer, two, on hoisting his flag; each member of the board of admiralty, four; the two secretaries, two each; and all the rest are nominated by the first lord of the admiralty. After passing an examination at the Royal Navy college, at Greenwich, and undergoing a successful probation for two years on board the training ship *Britannia*, they are assigned to sea-going ships, where, if they bring a first-class certificate from the *Britannia*, they become midshipmen at once; otherwise, according to the progress they make. See ANNAPOLIS, UNITED STATES NAVAL ACADEMY.

CADET'S FUMING LIQUOR. See CACODYLE.

CADI, an Arabic word signifying a judge or person learned in the law, the title of an inferior judge amongst the Mohammedan nations, who, like the Mollah (q.v.), or superior judge, must be chosen from the higher ranks of the priesthood, as all law is founded upon the Koran.

CADILLAC, city and co. seat of Wexford co., Mich.; on the Ann Arbor and the Grand Rapids and Indiana railroads; 96 miles n. of Grand Rapids. It is in a noted hard-wood timber belt, between Big and Little Clam lakes, and has electric lights, high school with library, several machinery factories, large lumber interests, and churches and weekly newspapers. Pop. '90, 4461.

CADILLAC, ANTOINE DE LA MOTHE, d. 1719; a French pioneer and officer in America, who came to Nova Scotia in 1691; commanded at Michillimackinac, 1691-97, and in 1701 founded Detroit. He was governor of Louisiana, 1712-17, where he had much trouble with the Indians.

CADIZ, a province in s. Spain, in the ancient division of Andalusia; bounded n. by Seville, e. by the Mediterranean, s. by the straits of Gibraltar, and w. by the Guadalquivir; 2800 sq. m.; pop. '87, 429,782. It is a mountainous region, traversed by the Sierra Nevada, and but partially cultivated. The wines of the province are especially fine. The western part is traversed by the Seville and Cadiz railroad.

CADIZ (ancient *Gades*), an important commercial city of Spain, capital of the modern province of the same name, which forms a part of the great division of Andalusia; is situated at the extremity of the long narrow isthmus of the isle of Leon, in lat. 36° 32' n., and long. 6° 17' west. The Atlantic ocean washes its western and part of its southern side, and on the n. and n.e. it is inclosed by the bay of Cadiz, a deep inlet of the Atlantic, forming an outer and an inner bay. Connected by only a narrow strip of ground (in some places not above 200 yds. across) with the mainland, C. is admirably situated for defense; but though it has several sea and land fortifications, these are by no means considered impregnable. The town, which is surrounded by walls, forms nearly a square, each side being about a mile and a half in length. The houses being built of white stone, the city presents a remarkably bright and clean appearance from the sea. The streets are well paved and lighted, regular, but narrow, and there are some pleasant public walks, the most frequented of which is the Alameda. It has few public buildings of note; its two cathedrals are, on the whole, but poor specimens of ecclesiastical architecture, and its pictures, with the exception of one or two excellent pieces by Murillo, are of little value. C. declined greatly as a commercial city after the emancipation of the Spanish colonies in South America; but owing partly to the extension of the railway system in Spain, and partly to the establishment of some new lines of steamers, the trade has revived considerably. The exports consist of wine, olive oil, fruits, salt, and metals. The manufactures are jewelry, tobacco, gloves, cotton and woolen cloth, soap, hats, leather, etc. Pop. '87, 62,531.

C. is one of the most ancient towns in Europe, having been built by the Phenicians, under the name of Gaddir, 347 years before the foundation of Rome, or about 1100 B.C. It afterwards passed into the hands of the Carthaginians, from whom it was captured by the Romans, who named it Gades, and under them it soon became a city of vast wealth and importance. Occupied afterwards by the Goths and Moors, it was taken by the Spaniards in 1262. In 1587, Drake destroyed the Spanish fleet in the bay; nine years later, it was pillaged and burned by lord Essex; and in 1625 and 1702, it was unsuccessfully attacked by other English forces. After the revolution of 1808, C. became the headquarters of the insurrectionary junta, by whose orders it was separated from the mainland. The French, in Feb. 1810, commenced a blockade, which they vigorously persevered in, capturing several of the forts, until Aug. 25, 1812, when the victories of the duke of Wellington forced them to abandon it. The city was besieged and taken by the French in 1823, and held by them until 1828. In the Spanish revolution of 1868, C. played a distinguished part.

CADMIA is the term applied to the crust formed in zinc furnaces, and which contains from 10 to 20 per cent of cadmium.

CADMIUM is a metal which occurs in zinc ores, and, being more volatile than zinc, rises in vapor, and distills over with the first portions of the metal. See ZINC. C. is represented by the symbol Cd, has the atomic weight 56—new system, 112—and the specific gravity 8.6. It is a white metal, somewhat resembling tin; is malleable and ductile; fuses at 599° F. (315° C.), and boils about 1580° F. (860° C.). It is rarely prepared pure, and is not employed in the arts as a metal, though one or more of its salts have been serviceable in medicine and photography. The sulphide of C., CdS, occurs naturally as the mineral *greenockite*, and when prepared artificially, is of a bright yellow color. It is known as cadmium yellow, and is of great value to the artist. A great variety of

tints is produced by mixing it with white-lead. Much of what is sold as Naples yellow (q.v.) is thus prepared; but the genuine Naples yellow has a greenish tint, which renders it easily distinguishable from the imitation. Cadmium yellow, however, has many valuable qualities, which are causing it rapidly to supersede Naples yellow.

CADMUS (according to Apollodorus and others) was the son of Agenor and Telephassa, and the brother of Europa. When the latter was carried off by Zeus, he and his brothers, as also their mother, were sent in quest of her, with injunctions from Agenor not to return without her. Their search was vain, and the oracle at Delphi told C. to relinquish it, and to follow a cow of a certain kind which he should meet, and build a city where it should lie down. He found the cow in Phocis, followed her to Bœotia, and built there the city of Thebes, about 1550 B.C. The myth of C., however, like other early Greek myths, abounds in contradictions, and it is wholly impossible to disentangle the historical facts from the meshes of fable in which they are imprisoned. To him is ascribed the introduction into Greece of an alphabet of 16 letters, derived from Egypt or Phenicia, and the discovery of brass, or introduction of its use.

CADODUAL, GEORGE, a distinguished leader in the Chouan or royalist war in Brittany, was b. near Auray, in lower Brittany, where his father was a miller, in 1771. He was among the first to take up arms against the republic, and soon acquired great influence over the peasants. Captured in 1794, he was sent as a prisoner to Brest, from which he soon made his escape, imprisonment having only increased his loyal ardor. Annoyed at the dissensions between the Vendean generals and the emigrant officers, and the disasters consequent thereon, C. organized an army in which no noble was permitted to command, and which Hoche, with all his great military talents, was unable to subdue or disperse. In 1799, C. was the soul of the conspiracy to overthrow the first consul, and place a Bourbon on the throne; but the events of the 18th Brumaire disarranged the plans of the conspirators. Bonaparte recognized C.'s energy and force of character, and offered to make him a lieutenant in his army, which offer C. refused, as well as another of a pension of 100,000 francs, if he would only consent to remain quiet. Bonaparte attempted to arrest him, but he fled to England, where, in 1802, he conspired with Pichegru for the overthrow of the first consul. With this design he went to Paris, but was arrested, condemned, and executed June 25, 1804. C. was a man of stern honesty and indomitable resolution. "His mind was cast in the true mold; in my hands he would have done great things," was Napoleon's estimate of him.

CADRE. (French, frame, outline, from Italian *quadro*.) The nominal establishment of officers of a regiment; the regiment on a peace footing; the skeleton organization, to be filled out in war by drafts from the reserve.

CADUCEUS, the winged staff of Mercury, or Hermes, as he was called by the Greeks, which was supposed to give the god power to fly. The C. in the actual world was the staff or mace carried by heralds and ambassadors, from which circumstance, no doubt, it came to form one of the attributes of the messenger of the gods. Originally, it was simply an olive-branch, the stems of which were afterwards formed into snakes, in accordance with several poetical tales invented by the mythologists. One of these was to the effect that Mercury, having found two snakes fighting, divided them with his rod, and that thus they came to be used as an emblem of peace. Many miraculous virtues were ascribed to the caduceus. On the coinage of antiquity, the C. is often given to Mars, who holds it in the left hand, a spear being in his right, to show how peace and war alternate. It is also seen in the hands of Hercules, Bacchus, Ceres, Venus, etc. Amongst the moderns, the C. is used as an emblem of commerce, over which Mercury was the presiding divinity.

CADWALADER, GEORGE, 1804-79; b. Penn.; bred to the law; served as brig.-gen. in the Mexican war and maj.-gen. of volunteers in the civil war.

CADWALADER, OR **CADWALLADER**, JOHN, 1742-86; b. Penn.; a member of the Pennsylvania convention of 1775, and brig.-gen. in the revolutionary war, participating in the engagements at Brandywine, Germantown, Monmouth, and Trenton. After peace he was a member of the Maryland assembly.

CÆCILIA (Lat. *cæcus*, blind), a genus of reptiles, formerly placed among serpents, on account of their form, although, in their anatomical structure, peculiarities were observed allying them to batrachians, with which they are now ranked, the important fact having been ascertained of their breathing by gills when young, and undergoing a metamorphosis. The body is almost cylindrical or worm-like, the head small, the eyes very small, and nearly hidden by the skin; in some species, indeed, imperfect or wanting, upon which account the name C. was given to them, and an attempt has been made to transfer to them the English name blindworm, commonly given to the *anguis fragilis*. The skin is smooth, viscous, and annularly wrinkled, appearing naked, although, upon dissection, minute scales are found disposed between its wrinkles, at least in some species. The vertebrae are articulated as in fishes and in some of the other lower batrachians, not as in serpents, and the skull is united to the first vertebra by two tubercles. The ribs are imperfectly developed, and much too short to encircle the trunk.—The original genus C. has been subdivided, now forming a family, *cæciliadae*. The species are inhabitants of warm climates, and of marshy or moist places.

CÆCILIVS STATIVS, d. 168 B.C.; a Roman comic poet and dramatist, of whose works few fragments remain. The people ranked him with Plautus and Terence.

CÆCUM (Lat. *cæcus*, blind), a blind sac; that is, a sac or bag having only one opening, connected with the intestine of an animal. In man there is only one C., very small, and apparently not performing any important function, situated at the extremity of the small intestine, where it terminates in the large intestine or colon. In many of the mammalia, however, and particularly in most of those which are herbivorous, it is comparatively large, and is found to secrete an acid fluid resembling the gastric juice. It therefore appears that, where the nature of the assimilatory process is such as to require the detention of the food for a considerable time, this provision is made for it, in order that digestion may be more completely accomplished. The C. is entirely wanting in some quadrupeds, as in bats, and the bear and weasel families. Birds have two cæca, which are generally long and capacious in those that are omnivorous or granivorous, and the position of which is the only circumstance that marks the division of the intestine into two parts, the small and the large intestine, or the *ileum* and the *colon*. In reptiles, a C. is of very rare occurrence. Fishes have none in the position occupied by those of quadrupeds and birds, but many of them have cæca attached to the intestine at its uppermost part, and very generally regarded as appendages of the stomach. The number of these cæca is, however, extremely various; sometimes there are only 2, and sometimes more than 100. The number is different even in very nearly allied species of the same family; thus, there are only 6 in the smelt, but 70 in the salmon; 24 in the herring, and 80 in the shad. In some fishes, as the cod, the cæca consists of large trunks ramified into smaller ones.—The intestinal canal of some of the *infusoria* is furnished throughout its whole length with numerous cæca, no other organ corresponding to a stomach appearing to exist. See VERMIFORM APPENDIX.

CÆDMON, the first Anglo-Saxon writer of note who composed in his own language, and of whom there are any remains. The date of his birth is unknown, but his death occurred about 680 A.D. He was originally a cowherd attached to the monastery of Whitby, and, according to Bede, "even more ignorant than the majority of his fellows, so that in the evenings, when the domestics assembled in the hall to recreate themselves with music after the labors of the day, C. was frequently obliged to retire in order to hide his shame when the harp was moved towards him." One night, however, as he was sleeping in the stable loft, a stranger appeared to him, and commanded him to sing. C. declared his ignorance, but the stranger would take no refusal, and imposed on the poor cowherd the sublime task of hymning the glories of creation. Suddenly a poetic inspiration seized him, and he began to pour forth verses. When he awoke from his dream the words remained fast-rooted in his memory, and were recited by him to others with new confidence. The abbess Hilda, and the learned men who were with her in the monastery, immediately declared that he had received the gift of song from heaven. He was now educated, became a monk, and spent the rest of his life in composing poems on the Bible histories and on miscellaneous religious subjects, many of which have been preserved, and are altogether in bulk nearly equal to the half of *Paradise Lost*, to parts of which some of them bear a striking resemblance. Satan's speech in hell is characterized by a simple yet solemn greatness of imagination, which may possibly have influenced at some period of his life the more magnificent genius of Milton.

The study of Cædmon had been virtually neglected for more than a century, when in 1830, the Danish scholar Grunot called the attention of English scholars to it. Editions of the *Paraphrase* of Cædmon have been published by Thorpe (trans. Lond., 1832); Bouterwek (Elberfeld and Gütersloh, 1851 and 1854); Grein in his *Bibliothek der angelsächsischen Poesie* (Gött., 1857-64). For the part relating to Exodus and Daniel. See vol. ii. of Harrison and Sharp's *Library of Anglo-Saxon Poetry* (Boston, 2d ed., 1885). See also Bernhard ten Brink's *History of English Literature* (vol. i., 1877); and Morley's *English Writers* (vol. ii., 1888).

CÆLATURA. See CHASING.

CÆLIUS AURELIANUS, a physician of Numidia in the latter days of the Roman empire, and author of a valuable medical work. He divided disease into two great classes, acute and chronic, devoting his work of ten books to their elucidation.

CÆLIUS MONS, one of the seven hills of Rome. See ROME.

CAEN, the chief t. in the department of Calvados, France—formerly the capital of lower Normandy—is situated on the left bank of the Orne, about 9 m. from its mouth, 122 m. w.n.w. of Paris. C. is built in the middle of a fertile plain; its streets are wide and clean, it has several fine squares, and many noble specimens of ancient Norman architecture. Among the best examples are the churches of St. Etienne, founded by William the Conqueror, and which contained his monument, erected by William Rufus, and destroyed by the Huguenots in 1562; La Trinité, called also *Abbaye aux Dames*, founded by Matilda, wife of the Conqueror; St. Nicholas, now a cavalry fodder-store; St. Pierre and St. Jean. The castle, founded by the Conqueror, and finished by Henry I. of England, was partially destroyed in 1793. There are several beautiful promenades in the city, which has manufactures of lace, blonde, crape, cutlery, cotton-yarn; breweries, dye-works, wax-bleaching, and ship-building yards. Its Angora gloves, made from the unwashed, undyed fur of Angora rabbits, which are reared in the district, are celebrated. Quarries in the neighborhood produce an excellent stone, called Caen stone (q. v.). Trade is facilitated by a maritime canal connecting the port with the sea, and

also by the railway connecting it with the Paris and Rouen line; those to Cherbourg, Tours, and Houfleur, and that to Flers, opened in 1867, which affords C. communication with Granville. Nothing is known of C. before the 9th century. Pop. '96, 45,380.

CAEN STONE. The neighborhood of the t. of Caen, in Normandy, has been celebrated for its stone quarries from a very early period. The excellence of the stone, and the facility of transport by sea, led to C. S. being very extensively used in England in the 15th and 16th centuries. In 1460, the abbot of Westminster obtained a license to import C. S. for the repairs of the monastery. Later, it became a regular article of importation, and in 1582 it is rated at the custom-house at 6s. 8d. the ton. Winchester and Canterbury cathedrals, Henry VII.'s chapel at Westminster, and many country churches, are built of C. S., which is still frequently used in England. The stone is an oolite, resembling Stonesfield slate, but without its slaty structure. The quarries are subterraneous, and the stone is brought up through vertical shafts in blocks 8 or 9 ft. long, and about 2 thick.

CÆRE. See CERVETERÉ.

CAERLE'ON (Castle of the Legion), a small but ancient t. in Monmouthshire, on the right bank of the Usk, 2 m. n.e. of Newport. It is the Isca Silurum of the Romans, and is supposed to have been the capital of the Roman province Britannia Secunda, now Wales, and the residence of the famous king Arthur. It was the seat of an ancient archbishopric, which was removed to St. Davids about 519 A.D. An abbey of Cistercian monks existed here before the reformation. C. was an important place in the 12th c., but it was afterwards ruined by the frequent wars between the Welsh and Anglo-Saxons. Many Roman relics have been found here, as aqueducts, baths, pavements, altars, tiles, coins, inscriptions, and statues; many of the smaller antiquities are deposited in a museum in the town; besides half-melted ore and cinders, and the remains of a fortress, with walls 12 ft. thick and 1800 yards long, and of an amphitheater, called king Arthur's round table, 222 by 192 ft. in size. Pop. '91, 1411. The chief occupation is the manufacture of tin-plates.

CAERMAR THEN (Welsh, *Caer Fyrd dyn*, the *Maridunum* of Ptolemy), a seaport t., capital of Caermarthenshire, South Wales, on the right bank of the Towy, 9 m. from Caermarthen bay. It lies in a picturesque situation, but the streets are irregular, steep, and often narrow. The Towy is navigable for vessels of 200 tons up to the town, and salmon and sewin are caught in the river. There are tin and iron works near the town. C. exports tin-plates, cast iron, timber, marble, bark, slates, lead ore, bricks, grain, butter, and eggs. The Welsh language is used in most of the churches. C. is a co. borough, having a separate jurisdiction from the shire. It unites with Llanelly in returning one member to parliament. Pop. '91, 10,338. There is a college for Welsh teachers. Near C. are the remains of two Roman camps. In the 5th c., Merlin, the Welsh prophet, is said to have been born here. It was long the residence of the native princes of South Wales. Caermarthen castle often changed hands in the contests of the Welsh chiefs with each other, and in the subsequent wars with the Saxons and Normans.

CAERMAR THENSHIRE, a maritime co. in South Wales, on the Bristol channel; bounded n. by Cardigan, from which it is separated by the Teify; e. by Brecknock; s. by Glamorgan and Caermarthen bay; and w. by Pembroke. It is the largest of the Welsh counties; length, 53 m.; greatest breadth, 33 m.; area, 918 sq.m., nearly a third of which is waste. The county is mountainous in the n. and e., and is characterized by productive though narrow valleys and deep, wooded glens. Caermarthen Van or Beacon rises to the height of 2596 ft., being the greatest elevation in the county. The coast of C. is marshy, and is all situated on Caermarthen bay, which washes also small portions of the coasts of Glamorgan and Pembroke, is 17 m. across, 10 m. deep, 35 in circuit, and receives the rivers Taff or Tawe, Towy, and Lhoughor. The chief rivers of C. are the Towy, Cothy, Taff, and Teify. The Towy has a course of 60 m., of which 50 are in Caermarthenshire. It yields plenty of salmon, sewin, trout, eels, and lamprey, and is navigable for the last 9 m. of its course. On this river is the celebrated vale of the Towy, 30 m. long, with an average breadth of 2 miles. C., n. and w. of the Towy, comprising three fourths of the county, consists of lower Silurian clay-slate and grauwacke. In the s.e. corner of the county is a band of carboniferous limestone and grit, to which succeeds a small part of the South Welsh coal-field of Glamorgan and Monmouth, chiefly composed of stone-coal and culm. The mineral productions of the county are iron, coal, copper, lead, slates, lime, dark-blue marble. These, with tinned iron, grain, cattle, horses, sheep, and butter, are exported. The climate of C. is mild, but moist; the soil is stiff and poor in the uplands, affording pasturage for small cattle; but the rest of the county is well wooded, and in the s. part along the rivers very fertile. Oats and barley are the chief crops. The chief towns are Caermarthen (the county town), Llanelly, Llandello-vawr, Llandovery, Newcastle-in-Emlyn, and Kidwelly. The chief manufactures are woollens and hides. Pop. '91, 130,566. The county proper sends two members to parliament. The towns of Caermarthen and Llanelly also send a member. The county contains so-called Druidical remains and Roman roads, besides many baronial and ecclesiastical ruins. In this county originated the "Rebecca" riots, which, in South Wales, in 1843-44, were directed against the turnpike-gates.

CAERNARVON (*Caer-yn-ar-Fon*, Fort opposite Mon or Anglesea), a parliamentary and municipal borough and seaport in North Wales, the capital of Caernarvonshire, situated near the s. end of the Menai strait, on the right bank of the Seiont, 245 m. n.w. of London. C. has a castle situated at the w. end of the town, the building of which was commenced by Edward I. in 1284. It is one of the noblest ruins in the kingdom, the walls being still entire, and inclosing an oblong of three acres. The walls are 7 to 9 ft. thick, and are pierced by a covered gallery, with loop-holes to discharge arrows. There are thirteen embattled towers, with five, six, or eight sides, and surmounted by turrets. The gateway under the great square tower has four portcullises. The town itself was once surrounded by walls and round towers. These walls, with several of the gates, still exist, but are now within the town. The streets are narrow, but regular, and at right angles to each other. In the churches and chapels, the services are in Welsh and English. C. unites with Pwllheli, Nevin, Criccieth, Conway, and Bangor in returning one member to parliament. It is an important commercial centre. The harbor admits ships of 400 tons. The chief exports are copper ore, coal, and slates, which are brought into the town by rail from quarries in the neighborhood. There is also a great iron and brass foundry. There are manufactures of writing slates, enamelled slate slabs, and tobacco. C. is a bathing place, and is much frequented by tourists, on account of its vicinity to the grandest scenery in North Wales. Many families of the upper ranks reside in and around the town. Pop. '81, 10,237. Half a mile from C. are the remains, covering seven acres, of Segontium, or Caer Seiont, a Roman station or city. Gold, silver, and copper coins and ornaments, and other Roman relics, have been found here. There is a Roman fort on the left bank of the Seiont, still almost complete, with walls 11 ft. high, and 6 ft. thick, and with parallel rows of holes 3 in. in diameter. C. was the seat of the native princes of North Wales down to 873. In 1284 was born here the first Anglo-Norman prince of Wales, afterwards the unhappy Edward II. In 1294, the town and castle were burned, and the English inhabitants massacred by the Welsh under Madoc, the illegitimate son of Llewelyn, a native prince of Wales. From a rocky height near Uxbridge hotel, there is a fine view of Snowdon and the island of Anglesea.

CAERNARVONSHIRE, a maritime co. in North Wales, bounded n. by the Irish sea; e. by Denbigh, with the Conway between; s. by Merioneth and Cardigan bay; and w. by Caernarvon bay and the Menai strait, the latter separating it from Anglesea. It is 51 m. long; greatest breadth, 22 m.; average, 9; area, 563 sq. m., of which $\frac{1}{2}$ is in pasture, and only $\frac{1}{10}$ th in tillage. The surface is mountainous, and is traversed by the grandest and highest ranges in South Britain, and it is the highest and most mountainous county in North Wales. The Snowdonian or chief range runs through the middle of the greatest length of the county, from s.w. to n.e., and is very bold and rocky. It attains the greatest elevation in Snowdon (q.v.), 3571 ft., in the center of the county, and the highest mountain in South Britain. Caernarvon bay is 30 m. across, 15 long, with 2 to 30 fathoms water, and communicates with the Irish sea through the Menai strait, which is 17 m. long, and $\frac{1}{2}$ to 4 m. broad. The rivers of C. are numerous, but small, from the nearness of all parts of the county to the sea. The Conway, navigable for 10 m., which runs along the e. border, is the chief. Almost all the streams flow through small lakes or tarns—of which there are 50 or 60 in the county—around the central or Snowdonian group of mountains. There are many fine cataracts on these streams. The mineral products of C. are copper, lead, zinc, coal, roofing and writing slates, slabs, chimneys, honestone. The slate quarries employ many thousands of workmen. The climate is mild in the peninsular part of C., but severe among the hills. The chief branch of rural industry in C. is the rearing of black cattle for the dairy, and of small sheep. Wheat, oats, barley, and potatoes are raised in the valleys. Pop. '91, 117,233. The chief towns are Caernarvon (the county town), Bangor, Pwllheli, Conway, Nevin, and Criccieth. In addition to the above boroughs, several flourishing towns have recently sprung into existence in the county—Llandudno, Tremadoc, and Bethesda being the principal. It returns two members to parliament—one for the county, and one for the six chief towns. Connected with C. is the Chester and Holyhead railway, on the great route from London to Dublin, which crosses into Anglesea by the Britannia tubular bridge over the Menai strait. C. contains the remains of British or Celtic camps and hill-forts, especially around Snowdon, several dolmens and stone circles, and some ancient castles. The Snowdonian mountains were long the stronghold of the Welsh against the Romans, Saxons, and Normans in their efforts to subjugate Wales, and here the Welsh were at last defeated in 1283 by Edward I.

CÆSALPINIA, a genus of trees of the natural order *leguminosæ* (q.v.), the type of the sub-order *cæsalpinieæ*. This sub-order is characterized by irregular flowers, which are not papilionaceous (q.v.), and contains upwards of 700 known species, among which many are notable for their purgative properties, as senna (q.v.); some produce eatable fruits, as the tamarind (q.v.), the carob (q.v.), and the West Indian locust tree (q.v.); some yield resinous and balsamic products, as copaiva (q.v.), aloes-wood (q.v.), etc.; some produce important dye-woods, as logwood (q.v.), Brazil wood (q.v.), camwood (q.v.), etc.; and some are trees of great size, and very valuable for their timber, as the purple-wood (q.v.) and the wallaba trees of Guiana. No species of the sub-order

is British, and it generally belongs to warm climates.—The genus *C.* contains a number of species, trees with pinnate or bipinnate leaves, natives of the warm parts of Asia and America, which yield the Brazil wood, Pernambuco wood (see BRAZIL WOOD), and sapan wood (q.v.) of commerce, also the astringent pods called dividivi (q.v.), used in tanning.

CÆSALPINUS, OR **CÆSALPINO**, ANDREAS, 1519–1603; an Italian philosopher of whose family or descendants nothing is known. He first appears as professor of botany in the university of Pisa, where he seems to have studied, and perhaps taught, anatomy and medicine. In his first work, *Speculum Artis Medicæ Hippocraticum*, he left proof, in a passage often quoted, that he had a clear idea of the circulation of the blood, at least through the lungs. In botany he was more original, and his works are highly philosophical and valuable, being a rich mine from which Linnæus, Morrison, and others took their ideas of botanical arrangement. He died in Rome in attendance upon pope Clement VIII.

CÆSAR, the name of a patrician family of the *Julia Gens*, one of the oldest in the Roman state, claiming to be descended from Iulus, the son of Æneas. When or from what cause the surname of *C.* was first acquired, is in the highest degree uncertain. Spartianus, in his *Life of Ælius Verus*, mentions four different opinions respecting its origin: 1. That the word signified an elephant in the language of the Moors, and was given as a surname to one of the Julii because he had killed an elephant; 2. That it was given to him because had been cut (*cæsus*) out of his mother's womb after her death; 3. Because he had been born with a great quantity of hair (*cæsaries*); or, 4. Because he had azure-colored eyes (*cæsi*). The opinion to which we most incline is the third of these, but who was the original “shock-head” of the gens we cannot say; the first, however, mentioned in history is Sex. Julius Cæsar, prætor in 208 B.C. The greatest individual of the family, and one of the greatest men the world has ever seen, was—

CÆSAR, CAIUS (OR RATHER GAIVS) JULIUS, son of a Roman prætor of the same name, was b. 12th July, 100 B.C. Two circumstances conspired to determine his sympathies in favor of democracy, and against a republican oligarchy: the first was the marriage of his aunt Julia with Caius Marius; the second, the marriage of *C.* himself, in 83 B.C., with Cornelia, daughter of L. Cinna, one of the principal enemies of Sulla. The anger of the dictator at this cost *C.* his rank, property, and almost his life itself. Feeling that he would be safer abroad for a time, he went to Asia, 81 B.C.; but on learning of the death of Sulla (78 B.C.), he hurried back to Rome, where he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. *C.*, however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he showed his political leanings by prosecuting (77 B.C.) Cn. Dolabella—a great partisan of Sulla—for extortion in his province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetor Apollonius Molo. In 74 B.C., he returned to Rome, where he had been elected pontifex, and now for the first time threw himself earnestly into public life. In the year 70 B.C., he attached himself to Pompey, whose political actions at this time were of a decidedly democratic character. In 68 B.C., *C.* obtained a questorship in Spain. On his return to Rome (67 B.C.), he married Pompeia, a relative of Pompey, with whom he was daily becoming more intimate. In 66 B.C., he was elected to the curule ædileship, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years, *C.* is found steadily skirmishing on the popular side. In 63 B.C., he was elected pontifex maximus, and shortly after, prætor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavored to persuade the consul, Cicero, to include *C.* in the list of conspirators. In 62 B.C., Pompey returned from the east, and disbanded his army. Next year, *C.* obtained the province of *Hispania Ulterior*. His career in Spain was brilliant and decisive. On his return, he was elected consul, along with M. Calpurnius Bibulus. Shortly before the passing of the agrarian law (59 B.C.), *C.*, with rare tact and sagacity, had reconciled the two most powerful men in Rome, who were then at variance, Pompey and Crassus, and had formed an alliance with them, known in history as the *First Triumvirate*. Both of these distinguished men aided *C.* in carrying his agrarian law; and to strengthen still further the union which had been formed, *C.* gave Pompey his daughter, Julia, in marriage, though she had been promised to M. Brutus; while he himself also married Calpurnia, daughter of L. Piso, his successor in the consulship. On the expiry of his term of office, he obtained for himself, by the popular vote, the province of *Gallia Cisalpinga* and *Illyricum* for five years, to which the senate added—to prevent the popular assembly from doing so—the province of *Gallia Transalpinga*. Nothing could have been more favorable for *C.*'s aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompey and Crassus, whom, in genius, he far surpassed. Leaving, therefore, the political factions at Rome to exhaust themselves in petty strifes, *C.*, in 58 B.C., after the banishment of Cicero, repaired to his provinces, and during the next nine years conducted those splendid campaigns in Gaul, by which, had he done

nothing else, he would have "built himself an everlasting name." C.'s first campaign was against the Helvetii, whom he totally defeated near Bibracte (Autun). Out of 368,000 only 110,000 remained. These were commanded by C. to return home and cultivate their lands. The eyes of the Gauls were now turned upon the new conqueror. His help was solicited, among others, by Divitiacus, an Æduan chief. This involved C. in a second war with a German prince, named Ariovistus, who was utterly overthrown; and now C., having in the course of one campaign successfully concluded two important wars, led his troops into winter quarters.

Next year (57 B.C.) occurred the Belgic war, in which C. successfully routed the Suesiones, Bellovaci, Ambiani, and Nervii, who, alarmed at the progress of the Roman arms, had entered into an alliance with each other against the invaders. When the senate received C.'s official dispatches, it decreed a thanksgiving of 15 days—an honor never previously granted to any other general. During the winter and the spring following, C. stayed at Lucca; and, after spending large sums of money in hospitality, and in other less praiseworthy purposes, he departed for Gaul, where the flames of war had burst out in the north-west. The Veneti, a maritime people of Brittany, were the chief instigators of the insurrection. C.'s plans were laid with consummate skill, and were crowned with the most splendid success. The Veneti were totally defeated, and most of the other Gallic tribes were either checked or subdued. C. wintered in the country of the Aulerici and Lexovii (Normandy), having, in the course of three campaigns, conquered Gaul. Next year (55 B.C.), Crassus went to Syria, and Pompey to Spain, while C.'s provincial government was prolonged for five years. He now undertook a fourth campaign against two German tribes who were about to enter Gaul. He was again successful; and pursuing the fleeing enemy across the Rhine, spent 18 days in plundering the district inhabited by the Sigambri. He next invaded Britain, about the autumn; but after a brief stay in the island, returned to Gaul. The Roman senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of 20 days. In 54 B.C., C. opened his fifth campaign by a second invasion of Britain. On his return to Gaul, C. was compelled—on account of the scarcity of corn, arising from drought—to winter his army in divisions. This naturally aroused the hopes of the Gauls, who thought the time had come for recovering their independence. An insurrection broke out in the n.e. of Gaul, which was at first partially successful, but was ultimately crushed. C. resolved to winter at Samarobriua (Amiens), in the vicinity of the malcontents. In 53 B.C., C. commenced his sixth campaign. It was chiefly occupied in crushing a second insurrection of the Gauls. C. now returned to northern Italy, that he might be able to communicate more easily and securely with his friends at Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, and doubtless C.'s heart beat with expectation of the mighty future, when all at once the plot that fate was weaving in his favor appeared to be completely marred by a tremendous rebellion over the whole of Gaul, headed by a young warrior named Vercingetorix. It was in the dead of winter when the news came to C., who instantly saw that, at all hazards, he must preserve his fame and his army. Leaving, therefore, Pompey to succeed at Rome, he hurried to meet the insurgent hordes. His great difficulty was to collect his scattered legions. First crossing, with some cisalpine and provincial troops, the mountains of Auvergne, though they lay 6 ft. deep in snow, he suddenly appeared among the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance. This was what C. wished. After some wonderful exhibitions of military skill and numerous successes, Vercingetorix was shut up in Alesia (Alise in Burgundy) with all his infantry. C. besieged him, and though harassed by nearly 300,000 Gauls without, who attempted, but in vain, to break through the well-defended Roman lines, forced Vercingetorix to capitulate. Many of the tribes now hastened to submit to C., who prudently determined to winter among the vanquished. The senate, of course, voted him another public thanksgiving. Next year (51 B.C.), C. proceeded to quell the tribes who still held out. This he successfully accomplished, and having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign at Nemetocenna, in Belgium, where he spent the time both in a magnanimous and politic manner. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes, and everything was done to render it possible for him to visit Italy with safety in the spring. This he did, and took up his residence at Ravenna, where he was informed of everything that was going on by the tribune C. Curio. There can be no doubt that at this moment he was the most popular man in the state, while his soldiery were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompey, whose vanity could not endure the greatness of C., had been gradually veering round again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic finessing on all sides, the senate carried a motion "that C. should disband his army by a certain day; and that, if he did not do so, he should be regarded as an enemy of the state." The tribunes, Mark Antony and Q. Cassius, put their veto on this motion; but they were violently driven out of the senate-chamber, and, fearing for their lives, they fled to C.'s camp. The

senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompey, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defense of the state. He fancied that his name would bring thousands to his standard, and he was even led to believe that C.'s troops were willing to desert their general: the result of which delusion was, that when hostilities formally commenced, he had hardly any soldiers except two legions which had recently been in the service of his rival. C., on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere; crossed the Rubicon (a small stream which separated his province from Italy proper), and moved swiftly, amid the acclamations of the people, towards Rome. Pompey fled to Brundisium, pursued by C., but contrived to reach Greece in safety, 17th March, 49 B.C. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. In three months, C. was master of all Italy.

C. next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return, he took Massilia, where he learned that he had been appointed dictator of the republic—a function which at this time he retained only for 11 days, but these were honorably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered, in Egypt, Greece, and the east, a powerful army, while his fleet swept the sea. C., however, crossing the Adriatic at an unexpected season, made a rush for Dyrrhachium, where Pompey's stores were; but was nevertheless outstripped by his opponent. Pompey intrenched his army on some high ground near the city, where he was besieged by Cæsar. The first encounter was favorable to Pompey, who drove back C.'s legions with much loss. The latter now retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia, 9th Aug., 48 B.C. Pompey's army was utterly routed; Pompey himself fled to Egypt, where he was murdered. See POMPEY.

No sooner had the news reached Rome, than C. was again appointed dictator for a year, and consul for five years. He was invested with tribunicial power for life, and with the right of holding all the magistral comitia except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Out of love for Cleopatra (who subsequently bore him a son), he entered upon the "Alexandrine war," in which he was successful, and which he brought to a close in Mar., 47 B.C. He next overthrew a son of Mithridates, near Cela, in Pontus, Aug. 2 of the same year, and arrived in Rome in September. He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year, he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, 6th April, 46 B.C. Cato committed suicide at Utica, and with such irresistible celerity was the work of subjugation carried on, that by the end of the summer C. was again in Rome. Now occurred that display of noble and wise generosity which proves C. to have been possessed of a great magnanimous nature. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, and so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa were celebrated by four great triumphs, during which the whole Roman populace was feasted and fêted by the magnificent liberality of the dictator.

He now proceeded to check, by wholesale enactments, as far as in him lay, the social evils which had long flourished in the city. During the year 46 B.C., also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which now broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of "Father of his Country," and also of *imperator*, was made dictator and *præfectus morum* for life, consul for 10 years; his person was declared sacred, and even divine; he obtained a body-guard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honor; and on all public occasions he was permitted to wear the triumphal robe. He now proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine marshes, to enlarge the harbor of Ostia, to dig a canal through the isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the ides (15th) of Mar., 44 B.C. The details of this crime—the greatest disaster that could have befallen the Roman world, as subsequent events showed—are too familiar to require narration. It is sufficient to say that, of the sixty aristocrats who were in the conspiracy, many had partaken of C.'s generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by C.'s desire to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by a spleenful hatred of the dictator, and the base ambition of regaining power at all hazards.

C., who was 56 years of age when he was murdered, was of a noble and kingly pres-

ence, tall of stature, and possessing a countenance which, though pale and thin with thought, was always animated by the light of his black eyes. He was baldheaded (at least in the latter part of his life), wore no beard, and though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but without meaning to detract from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his licentiousness which a more humble lot would have escaped. His intellect was marvelously versatile. In everything he excelled. He was not only the first general and statesman of his age, but he was—excepting Cicero—its greatest orator. As a historian, he has never been surpassed and rarely equaled in simplicity and vigor of style, and in the truthfulness with which he narrates events of which he was an eye-witness. He was, in addition, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. Most of his writings have been lost, though their titles are preserved; but we still possess his invaluable *Commentarii* (generally known as “Caesar’s Commentaries on the Gallic and Civil Wars”). The *editio princeps* was printed at Rome 1449. C.’s life was formally written in ancient times by Suetonius and Plutarch. There are modern lives by Delorme, Napoleon III. (1865), and J. A. Froude (1879). The best edition of his works is that of Dinter (1890). For his campaigns, see Dodge’s *Cæsar* (1892).

CÆSAR, Sir JULIUS, 1558–1636; an English statesman, educated at Oxford and the university of Paris; doctor of civil and canon law. He was master of the rolls, and held other high offices under Elizabeth and James I.

CÆSARE'A (*Turris Stratonis*), called by the natives “Kaisari'yeh.” This once proud and splendid seaport, perhaps one of Herod’s most magnificent works—a Grecian town with its temples, amphitheater, baths, etc., imported into Syria—was situated on the coast of Syria, 95 m. s. of Beyrout, and 37 m. n. of Jaffa.

In 65 A.D., Gessius Florus, the worst of all petty tyrants that had afflicted Judea, was appointed governor of Cæsarea. About that time, a terrible revolution, which commenced at C., broke out all over Judea. It arose from a dispute between the Syrian and Jewish citizens of C. as to which of them the city really belonged to; and some idea may be formed of the extent of the insurrection from the fact that above 20,000 Jews were massacred in C. in the space of one hour; 13,000 in one night at Scythopolis; 50,000 at Alexandria; 8000 at Joppa; and 10,000 at Damascus.

C. was occupied by the crusaders; after them, it seems to have gradually decayed into nothingness. It is now a heap of half-buried ruins.

CÆSARE'A PHILIPPI (*Panion*). This town, mentioned in Matt. xvi. 13, was situated about 20 m. n. of the sea of Galilee. It was distinguished from the Cæsarea on the coast of Syria by the appendage of “Philippi,” given to it in honor of Philip the tetrarch, who repaired the city. It is now a heap of ruins, overgrown with bushes and grass.

CÆSAREAN OPERATION (*cædo*—*cæsus*) has, from very ancient times, been the popular name for *hysterotomy* (*hystera*, uterus; *tome*, section). Pliny distinctly alludes to it in his *Natural History* (lib. vii. cap. ix.), saying that Cæsar was so called from being taken by excision out of the womb of his mother, and that such persons were called *Cæsones* (Cæsar a cæso matris utero dictus; quæ de causâ *Cæsones* appellati). In his case, the mother must have survived the operation, as Aurelia was alive when her son invaded Britain.

The pages of a popular work scarcely allow of the details of such a proceeding, but we may state that the first incision is made exactly in the middle line of the body, to the length of 6 or 7 inches. When the uterus is exposed, it must be carefully opened, the child lifted out, and then the after-birth. The uterus now contracts, and sinks down into the pelvis, the wound is closed, and opium is given to the patient to allay pain and nervous irritability.

In Great Britain, the C. O. has been rarely performed, most likely from the skill of the accoucheurs rendering such a proceeding unnecessary; but still several cases are on record where not only the child, but the mother, was saved. Some women, indeed, seem to have accepted it as their usual method of delivery, having several children, each requiring to be removed through an abdominal incision; one woman submitted to it seven times. It has also been successfully performed in most unfavorable circumstances. In the year 1500, a sow-gelder operated successfully on his own wife; an illiterate Irish midwife, Mary Donally, operated with a razor on a poor farmer’s wife in Jan., 1738, and removed a dead child; her patient completely recovered, so as to be able to walk a mile on foot on the 27th day after the operation. Nay, a negro woman in Jamaica cut herself open with a butcher’s knife, removed her infant, and recovered. Practitioners are not quite decided as to the circumstances which justify the performance of this severe operation on the living female, but all agree on the propriety of at once removing by it the child of a recently dead woman. Numa Pompilius decreed that every pregnant woman who died should be opened; and the senate of Venice, in 1608, decreed that practitioners should perform, under heavy penalties, the C. O. on pregnant women supposed to be dead. In 1749, the king of Sicily decreed the punishment of death to

medical men who omitted to perform it on women dying when advanced in pregnancy. Of course, to be of any use, it must be performed immediately.

CÆSARISM, in its historical aspect denotes a pure despotism, at once military, civil, judicial, and religious, professedly maintained in the interest of the people; such a despotism, in fine, as that of the Roman empire under the Cæsars. In its modern acceptation, since in the more civilized nations the permanent possession of these powers untrammelled by constitutional limitations is rarely, if ever, vested in a single person, the word is often applied to a temporary political dictatorship arising in the confusion of revolutionary commotions and in the disorganization of parties. It invariably implies the idea of a government good or bad, according to the character of the person who exercises it.

CÆSIUM. See **RUBIDIUM**.

CÆSU'RA, a pause or division in a verse; a separation by the ending of a word, or by a pause in reading, of syllables rhythmically connected, as in this line: "These parting num-bers, ca-denced by my grief."

CAF, or **KAF**, the mountain, or range of mountains, that in Arabic and Persian fiction surrounds the earth. The pivot on which the mountain rests is a great emerald from which the sky receives its colors, and the mountain is the dwelling-place of giants and genii. "From Kaf to Kaf" signifies from one to the other end of the world.

CAFFA. See **KAFFA**.

CAFFARELLI, or **GAFFARELLI**, GAËTANO MAJORANO, 1703-83; an Italian vocalist who, when a boy, was properly qualified for singing feminine parts, and was deemed the first soprano of the age. He was highly successful for many years, having no rival excepting possibly Farinelli; and he had success as a composer also. On returning to private life he built a palace, over the entrance of which he inscribed: "Amphion built Thebes; I this house," alluding to the story that the walls of Thebes rose without hands to the music of Amphion's lyre.

CAFFEÏNE, or **THEÏNE**, $C_8H_{10}N_4O_2 + H_2O$, is the alkaloid or active principle of coffee (q.v.) and tea (q.v.). When isolated, it forms beautiful white crystals, with a silky luster, which are soluble in water, alcohol, and ether. It is present in coffee to the extent of about 1 per cent, and in ordinary or Chinese tea, from 2½ to 6 per cent; and is also found in Paraguay and Guiana teas. It may be extracted from coffee or tea by making a decoction in hot water, and adding acetate of lead, which causes a precipitate of caffeotannate of lead. When the latter is acted on by sulphuretted hydrogen, the lead is separated, and the C. left in solution. On evaporation of the liquid, and recrystallization from alcohol, the C. separates in crystals.

CAFFER BREAD, a name given to several species of *encephalartos*, trees of the natural order *cycadaceæ* (q.v.), which, like many others of that order, have much starch in their stems, and afford food to the natives of South Africa. They are also called bread-trees.

CAFFEERS. See **KAFFIRS**.

CAFFRA RIA. See **KAFFRARIA**.

CAFFRISTAN'. See **KAFIRISTAN**.

CAFTAN. See **KAFTAN**.

CAGLI, a walled t. in the province of Urbino, Italy, at the confluence of the Cantiano and Busso, where there is an old Roman bridge over the former river. It is a bishop's seat, and has several monasteries, in one of which is a famous fresco by Giovanni Sanzio, the father of Raphael. Leather manufacturing is the chief business. Pop. about 10,000.

CAGLIARI, the capital of the island of Sardinia, situated on the side of a hill, on the n.e. shore of a spacious bay, and on the s. coast of the island, in lat. 39° 13' n., long. 9° 8' east. It has a spacious and safe harbor, defended by several forts, and is the emporium of all the trade of the island. The town contains many public buildings and churches, and has a university with 100 students; but its streets, for the most part, are very narrow, steep, and dirty. C. had a pop. of (1894) 44,300. It has also a dockyard, and a good road was some years ago constructed from C. to Sassari, the second city in the island, and to some of the more considerable places. Steamers ply very frequently between C. and Genoa; and it is now united to the continent of Europe by a line of electric telegraph.

CAGLIARI, PAOLO, best known as *Paolo Veronese*, an Italian painter of great eminence, was b. at Verona in 1528. He first studied under his uncle, Antonio Badile, a respectable artist, and afterwards settled in Venice, where he rapidly acquired both wealth and reputation. He had for contemporaries both Titian and Tintoretto, and was held in equal admiration with these famous painters. The church of San Sebastiano, in Venice, contains many of his productions, which are reckoned the most important of his earlier period—i.e., the period before he visited Rome, when he first became acquainted with the masterpieces of Raphael and Michael Angelo. The influence of the Roman school on his style was so happy, that, on his return, he received the honor of knighthood from the doge. He died 19th April, 1588. C. is remarkable for the fertility of his

imagination. His design is generally noble, his composition rich, and his execution truthful. In the invention of details, especially, he is inexhaustible, and often overloads his pictures with ornament. One peculiarity of his works is the frequent introduction of splendid architectural backgrounds, which, however, were generally painted by his brother Benedetto. The most celebrated of his productions is the "Marriage Feast at Cana of Galilee," now in the Louvre at Paris. It is 20 ft. high, and 30 in length, and contains 130 figures. Besides these may be mentioned "The Calling of St. Andrew to the Apostleship," "The Feast of Simon," and the "Presentation of the Family of Darius to Alexander."

CAGLIOSTRO, Count **ALESSANDRO DI**, a notorious impostor, who, in the latter part of the 18th c., traveled through Europe, and whose adventures afford considerable insight into the social characteristics of his times. He was born at Palermo, of poor parentage, June 2, 1743, and his true name was GIUSEPPE BALSAMO. Carlyle's picture of him when a boy—"brass-faced, vociferous, voracious"—is probably accurate, and already prophesies the bold and boisterous quack. When 13 years old, he ran away from the seminary of St. Roch, and was afterwards sent to a monastery at Cartagione. Here he became assistant to the apothecary of the monastery, and picked up that scanty knowledge of chemistry and medicine, which was afterwards found quite sufficient to impose upon so many respectable individuals. His conduct in the monastery was in keeping with his character, but finding it too contracted a sphere for the development of his ambitious genius, he left it, or was ejected, and for a time led "the loosest life" in Palermo. When 26 years old, he found it highly advisable to leave his native place. In company with a certain sage named Althotas, C. is vaguely represented as traveling first in some parts of Greece, Egypt, and Asia. At Rome, "his swart, squat figure first becomes authentically visible in the Corso and Campo Vaccino. He lodges at the sign of the Sun in the rotunda, and sells etchings there," very hard up at this time. In Venice, "the bull-necked forger" contrived to marry a very pretty woman named Lorenza Feliciani, who became a skillful accomplice in his schemes, and captivated many admirers, while C. picked their pockets. C. now made the tour of Italy with great success as a physician, philosopher, alchemist, freemason, and necromancer. Next, he extended his victorious career through some parts of Germany, and especially carried on a lively business in his "elixir of immortal youth," which became very popular among the ladies. By virtue of this fine medicine, the count assured his patients that he had already attained his 150th year, while his young and charming wife often talked affectionately of her son as "a commander in the Dutch navy." Through Courland, the count and his accomplice advanced triumphantly to the court of St. Petersburg, where he seems to have first made a failure; for the empress Catharine, aided by her Scotch physician, Rogerson, a keen-witted native of Annandale, who skeptically examined his famous "Spagiric food," and pronounced it "unfit for a dog," penetrated his real character, and made him the subject of a comedy. C. soon found it convenient to vanish. We next find him at Warsaw, discoursing on his pet Egyptian masonry, medical philosophy, and the ignorance of doctors, but he had the misfortune to be unmasked by a certain count M. This, however, had little effect on the stupid credulity of C.'s dupes—belonging, it must be remembered, to the upper classes, who in that age, according to Carlyle, were at once sensual, infidel, and superstitious—so that they persisted for a time in "distending his pockets with ducats and diamonds," which, however, his lavish dissipation soon scattered to the winds—for this prophet of a new physical and moral regeneration, and inventor of an "invaluable pentagon for abolishing original sin," was a desperate gambler. In 1780 he went to Strasburg; and soon afterwards we find him in Paris, still founding lodges of "Egyptian freemasons," holding nocturnal meetings for calling "spirits from the vasty deep," etc., and scandalously simulating the character and deeds of a philanthropist. From Paris he went over to England, where he was cordially received by the followers of Swedenborg. On his return to Paris (1785), he became distinguished at court, was intimate with the weak and credulous cardinal Rohan, and played a prominent part in the affair of the diamond necklace (q. v.). This lodged him in the Bastille, but he cleared himself by a statement which gained credit, and, after being liberated, carried on his adventures once more in England, but feebly, the sunshine of success now obviously growing dim; in short, the count, in gloom and foreboding, disappeared from the island. But the market in Germany, too, was closed, a general distrust having been excited by the revelations of one of the count's dupes. Elsewhere, also, these began to fail him. "At Aix, in Savoy, there are baths, but no gudgeons in them;" at Turin, he is ordered off by the king; a similar fate befalls him at Roveredo; at Trent, we catch a glimpse of him, "painting a new hieroglyphic screen," which, however, attracts no more the gaping crowd; lower still, "he pawns diamond buckles;" finally, his wayworn wife—in whom, perhaps because of her womanhood, the enormous lie and quackery first breaks up—"longs to be in Rome by her mother's hearth, by her mother's grave, where so much as the shadow of refuge awaits her." In May, 1789, he entered the city; on the 29th December, the holy inquisition detected him founding "some feeble ghost of an Egyptian lodge." He was imprisoned, and condemned to death for freemasonry. His sentence was commuted to imprisonment for life in the fortress San Leon, where, in spite of his "elixir of immortal youth," he

died, 1795, aged 52 years. His wife ended her days in a convent. His *Mémoires Authentiques*, posthumously circulated in Paris, were *not* authentic.—See Carlyle's *Miscellaneous Essays*, art. Count Cagliostro.

CAGNOLA, LUIGI, MARCHESI, a distinguished Italian architect, was b. at Milan in 1762—d. 1833. Belonging to an ancient and wealthy family, he could afford to follow the bent of his own inclination, and devoted himself earnestly to the study of architecture. His master-works are two triumphal arches. The first is the famous *Arc de la Pace*, in Milan, commenced in 1807, but not finished until 1838. It is constructed of white marble, and, with the exception of the *Arc de l'Etoile*, in Paris, is both the largest and noblest structure of the kind in Europe, reaching a height of 78 feet. On the top of the arch is a bronze figure of Peace, in a car drawn by six horses, while the sides are richly adorned with innumerable bas-reliefs. The second forming the *Porta di Marengo*, or *Porta Ticinense*, is also a work of great beauty, and is much admired. Besides these may be mentioned the *campanile* (bell-tower) at Ugnano, in the Bergamese.

CAGOTS is the name given to a tribe of men, of manners and customs akin to those of the gypsies, who are found scattered through various parts of Bearn and Gascony, in France. They are usually thought to be the descendants of the Visigoths, who remained in France after their defeat by Clovis, in the 5th century. Until the French revolution of 1790, they received even worse treatment than that which generally falls to the lot of remnants of conquered races. They were forced to wear a peculiar dress, were forbidden to practice all but the most menial trades, and were obliged to live isolated, either in separate villages or in separate quarters of the towns. So complete was their estrangement from the other inhabitants, that they were forced to enter the churches by doors specially set apart for them. Since that revolution, they have been placed, as regards the law, on an equal footing with other citizens, but socially they are still regarded as a degraded race. Their language has been, so far back as is known, a corrupt dialect of that spoken in the surrounding country; but their blue eyes, fair hair, and fair complexion, mark them out as ethnologically distinct, and speak to a Teutonic origin. From a great liability to the diseases afflicting cretins, probably caused by their exposed manner of life and insufficient nourishment, they were at one time erroneously thought to belong to that unfortunate class. Tribes, whose history and present condition greatly resemble those of the C., are to be found in Brittany, where they receive the name of "Caqueux;" and in Poitou, Maine, and Anjou, where they receive the name of "Coliberts." See Michel's *Histoire des Races Maudites de la France et de l'Espagne* (History of Outcast Races in France and Spain), Par. 1847.

CAGSANA, a t. near the southern extremity of the island of Luzon, Philippines, with a population of about 13,000.

CAHAWBA, a river rising in Jefferson co., Ala., flowing s.w. through a region rich in coal, and joining the Alabama 8 m. w. of Selma. The C. is navigable by small craft for about 100 miles.

CAHEN, SAMUEL, 1796–1863; a French Jew noted as a Hebrew scholar. He translated the Old Testament into French with Hebrew on opposite pages, and with notes and comments. He also founded the *Archives Israélites*, a monthly publication devoted to Jewish questions and interests.

CAHENSLEYISM, a name given to the plan proposed in 1892 by the German Catholic Bishop, Cahensley, who advised that the foreign-born population of the United States should be divided, for ecclesiastical purposes, according to their European nationality, under priests speaking their own languages, and of like race. This plan, which would tend to perpetuate in this country the racial divisions of Europe, was vigorously and successfully opposed by Cardinal Gibbons, Archbishop Ireland, and other leaders of the "American party" in the Roman Catholic Church.

CAHIR, or **CAHER**, a t. in the co. of Tipperary, Ireland on the Suir, situated at the e. end of a valley between the Galtees and Knockmeleadow mountains, 8 m. n.w. of Clonmel. In the town is the seat of the earl of Glengall, with a park which extends along the river for 2 m. below the town. Cahir castle, an ancient irregular Norman structure of considerable extent, is situated on a rock on the left bank of the Suir. It was taken by the earl of Essex in 1599, and by Cromwell in 1650; it has been lately restored. C. has extensive flour-mills, and a pop. of about 2500. There are large barracks near Cahir.

CAHORS (anciently *Divona*), a t. in the department of Lot, France, is situated on a small rocky peninsula, formed by a bend of the river Lot—here crossed by three bridges—about 60 m. n. of Toulouse. The streets of C. are steep and narrow, and present many specimens of antique architecture. It has a fine cathedral, and several Roman remains, including those of a magnificent aqueduct. There is an obelisk to Fénelon, who was a student at the university here. The town was taken and pillaged by Henri of Navarre in 1580. It has manufactures of cotton-yarn, woolens, leather, paper, glass, etc.; the district produces wine in considerable quantities. The pop. in 1872 was 11,416; and in '91, 15,369.

CAIAPHAS, high-priest of the Jews in the reign of Tiberius Cæsar, at the beginning of Christ's ministry, and also at the time of his trial and crucifixion. His wife was the

daughter of Annas, a former high-priest, who still had great influence in sacerdotal matters. In the council summoned by the chief-priests and Pharisees to take action upon the remarkable spread of the doctrines of Jesus, Caiaphas, was decidedly in favor of putting him to death, using the prophetic language: "Ye know nothing at all; nor consider that it is expedient for us that one man should die for the people, and that the whole nation perish not." Christ was arraigned before Caiaphas, when the effort to convict him on false testimony failed; and then the prisoner was called as a witness and asked if he was indeed the Christ, the son of God. The answer being in the affirmative, the high-priest pretended to be sorely grieved at what he considered blasphemy, and appealed to Christ's enemies to say if that was not enough. The answer was that Christ deserved death, and without remonstrance from the high-priest, they at once fell upon the prisoner with insult and injury. But the high-priest had not the power of final condemnation, that being in the hands of the Roman governor only.

CAICOS, or **CAYOS**, or **KEYS**, a term applied to numberless rocky islets of the West Indies, and that generally with a reference to some more considerable island in the neighborhood. Thus, to take the Bahamas as an instance, there are the Keys of Providence, of Eleuthera, or Abaco, etc. But more specifically the name is often appropriated to the south-easterly members of the Bahamas. Though geographically a portion of the Bahamas and formerly under the government of Bahama, they form with Turk's Islands a separate government under the governor of Jamaica. A commissioner, assisted by a legislative board of five members appointed by the Crown, administers the government. There are more than 30 small islands, having an area of about 169 miles, but only 6 are inhabited. The largest is Grand Caicos, which is 20 miles long by 6 broad. The seat of government is at Grand Turk, which has a public library and reading room. The chief industry is salt raking, and a considerable amount of salt is exported annually to the United States, Canada and Newfoundland. There is also a sponge fishery. The pop. in 1891 was 4745.

CAIFA, or **HAI'FA**, a seaport on the coast of Syria, situated exactly opposite Acre, upon a spur of Mt. Carmel, and on the s. side of a wide semicircular bay, 4 m. across. It is the ancient Hefa, or Sycaminopolis. It covers but a small space of ground, and contains no edifice of any note except a few minarets. The houses are built of rough unhewn sandstone, plastered over with lime—the roofs flat. Pop. about 2000—Moslems, Christians, and Jews. C., having a better anchorage than Acre, is fast eclipsing that city as a port, and in recent years almost all the trade of Acre has been transferred to it. Consular agents from England, France, etc., have been established at C. In the neighborhood a German colony settled in 1870, and Russian Jews have also formed a settlement here. C. is surrounded by beautiful gardens of palm, olive, orange, citron, fig, mulberry, and pomegranate trees.

CAILLIAUD, **FRÉDÉRIC**, 1787-1869; a French goldsmith who traveled in various parts of Europe, Egypt, and Asia Minor. He was engaged by Mehemet Ali to explore the deserts along the Nile and near the Red Sea, and in the work discovered the emerald mines of Mt. Zabarab. He returned to France with a valuable collection of antiquities, plants, and minerals, and published *Voyage à l'Oasis de Thebes*, etc. He went again to Egypt and made explorations in the eastern deserts, making an expedition to upper Nubia with Ismael Bey. In 1819-22, he published *Voyage à Meroe*. Among the relics of antiquity brought by him to France and purchased by the government, was a mummy, inscribed with hieroglyphical characters accompanied with a Greek translation, which proved of great help to Champollion in the study of the ancient language.

CAILLIE, **RENÉ** or **AUGUSTE**, a French traveler, noted for his journey to Timbuctoo, was born 19th Sept., 1799, at Mauzé, in the department of Deux-Sèvres. Having gone to Senegal, and engaged in trading with the natives, he learned, about 1826, that the geographical society of Paris had offered a premium of 10,000 francs to the first traveler who should reach Timbuctoo. Provided with a stock of goods for barter, C. started from Sierra Leone, Mar. 22, 1827, and after some delay caused by illness, he reached the mysterious city in April, 1828, where he remained 14 days. On leaving Timbuctoo, he accompanied a caravan across the Sahara desert, reaching the coast at Tangier. After hearing and examining his statements, the society awarded him the offered prize, with a pension of 1000 francs, and the order of the legion of honor. His notes of travel, arranged by M. Jomard, were published under the title *Journal d'un Voyage à Tembouktou et à Jenné dans l'Afrique Centrale*, etc. (3 vols., Par. 1830). In England, doubts were raised as to the veracity of C., but without just grounds. C. died at his estate, in the neighborhood of Paris, May 25, 1838.

CAIMACAN', or **KAIMAKAM**, a Turkish officer corresponding with lieutenant or lieutenant-governor. The caimacan of Constantinople is the lieutenant of the grand vizier, whom he represents in processions. Such officers also act as governors in the principal towns.

CAIN, the first-born of Adam and Eve. His history, as recorded in the book of Genesis, is mysterious and inexplicable, and the traditions which a later superstition has gathered round it, have thrown no light whatever on its dark perplexity. As the first murderer, his memory has always been profoundly execrated by the Christian church; yet such is the perversity of human nature, that one sect—if not more—of the pseudo-Gnostics found his actions and character so much to their liking, that they called themselves *Cainites* (130 A.D.), and invented an explanation of his alleged crime, which, like

most of the Gnostic heresies in the early church, sprang out of the deep-rooted fundamental error of the "two principles." The Cainites believed that C. was the offspring of the intercourse of a superior power with Eve, and Abel of an inferior power; that their characters corresponded to their paternal parentage, and that the slaying of Abel only symbolized the victory of the superior over the inferior power. The subsequent punishments of C. were regarded as the persecutions of Abel's father—i.e., the Jewish God. For the same reason, they highly honored all the reprobates of the Old Testament—such as the people of Sodom, Esau, Korah, Dathan, and Abiram—whom they looked upon as the victims of the hatred of Jehovah. It is unfortunate that we possess only distorted and fragmentary accounts of this, as of all the other heretical sects. The Cainites are also said to have denied the dogma of the resurrection of the body, to have rejected the New Testament, and accepted a gospel of Judas, the betrayer.

CAINE, THOMAS HENRY HALL, b. Runcorn, Cheshire, England, May, 1853; author; visited Canada and the United States to promote international copyright in 1895-6. His publications include *The Shadow of a Crime* (1885); *The Deemster* (1887); *The Manxman* (1893); *The Bondman* (1895); *The Scapegoat* (1891); *The Christian* (1897); sonnets, poems, and criticisms.

ÇA IRA, French revolutionary song, the words by Ladré, a street singer, and the melody originally a popular contre-danse entitled *Carillon National*, a favorite air of Marie Antoinette's. The song is said to have been first sung when the mob marched to Versailles, Oct. 5, 1789. It was prohibited by the law of the 18th Brumaire in 1799.

CAIRD, EDWARD, LL.D., educator; b. Scotland, 1824; educated at Oxford university; became professor of moral philosophy in Glasgow University in 1866, and master of Balliol college in 1893; author of *The Critical Philosophy of Immanuel Kant* (1889), *Essays on Literature and Philosophy* (1892), *The Evolution of Religion* (1893), etc.

CAIRD, Sir JAMES, b. 1816; an agriculturist of Scotland, author of *High Farming as the Best Substitute for Protection*. In 1850-51 he visited all parts of England as agricultural writer for the *London Times*, his letters being afterwards published in a volume. In 1858 he visited the United States and wrote an account of the western territories. While in parliament he was the originator of agricultural statistics, now annually published by the British government. He was made K.C.B. in 1882, and d. in 1892.

CAIRD, Rev. JOHN, D.D., a minister of the established church of Scotland, and one of the most eloquent preachers in Great Britain, was b. at Greenock in 1820. He studied at the university of Glasgow, and in 1845 was ordained to the pastorate of the church of Newton-upon-Ayr, whence in 1847 he was translated to Lady Yester's, Edinburgh. Here his popularity was extraordinary, but the demands made on his physical energies were so great that he found it necessary to retire to the country, and accepted, in 1849, the country charge of Errol, in Perthshire. A sermon which he preached before the queen in 1855, in the church of Crathie, and which was published, by royal command, under the title of *The Religion of Common Life*, was universally admired throughout Great Britain, translated on the continent under the auspices of chevalier Bunsen, who wrote a preface to it, and suddenly carried the fame of the author into all parts of the Protestant world. In 1857, Dr. C. accepted a call to Glasgow. In 1858 he published a volume of sermons, marked by beauty of language, strength of thought, and earnest sympathy with mankind. He received the degree of D.D. in 1860. In 1862, he was appointed professor of divinity, and in 1873, principal of Glasgow university. He published *The Universal Religion* (1874); *Introduction to the Philosophy of Religion* (1880); *The Religions of India* (1881); *Spinoza* (1889), etc.

CAIRN, or **CARN**, a Celtic word, signifying a protuberance, a heap, a pile. In that sense, it appears in the names of hills and other natural objects in Scotland, Ireland, Wales, Cornwall, and Brittany. It is also applied to artificial heaps of unhewn stones, which, among archaeologists, have come to be generally known as "cairns."

There are several kinds of cairns. The simplest and most common form seems to be a conical pile of stones of no great size. Next is what may be called the fence or ringed C.—a heap of stones girdled round by large unhewn stones set upright in the ground. Some cairns have two, and a very few have three such concentric girdles; in some instances, there are concentric rows of upright stones within the cairn. Many cairns are found in the neighborhood of the circles of unhewn stone pillars which antiquaries used to style "Druidical." In a few instances, cairns are found at the end of an avenue of standing stones. Some cairns are fenced round by a narrow ditch and a small earthen rampart. A very few cairns have unhewn flat stones on their tops; a still smaller number are surmounted by an unhewn stone pillar. A few are oblong in shape.

Cairns were erected, doubtless, for several purposes. It appears from record that they were often raised to distinguish the marches or boundaries of lands. One C., near Balmoral, on the Highland Dee, is said to have been erected as a mustering-place for the men of Strathee, who took its name, *Cairn-na-cuimhne*, or "C. of remembrance," for their slogan or war-cry. In later times, places where great crimes had been committed were marked by cairns; thus, "Mushet's C.," in the Queen's park at Edinburgh, shows the spot where a wife was murdered by her husband, under circumstances of peculiar atroc-

ity, in 1720. But that the great purpose of the C. was sepulchral, is shown by the human remains found in so many of them. "*Disiectis et erutis, ossa inveniantur, et quibusdam honor nominis adhuc manet*," says Robert Gordon of Straloch, writing of Scotch cairns in 1654. "For the cairns or heaps of stones in several parts of Ireland," wrote Thady O'Roddy in 1617, "some of them were heaped as monuments of battles, some made in memory of some eminent persons buried in such a place." A Highland suppliant would have said to his benefactor: *Curri mi cloch er do charne*, "I will add a stone to your cairn." The bones found in cairns are generally calcined or half-burned, and inclosed either in what are called *cists*—small rude coffins of unhewn stones—or in urns of earthenware, which, again, are in many cases protected by stone cists. Along with the bones are often found flint arrow-heads, flint axe-heads, stone hammers, stone rings, glass beads, implements of bone, bones of horses and oxen, spear-heads, and other weapons of bronze. In some instances, human bones are found unburned, inclosed in stone cists about 3 ft. long, or, more rarely, of the full size of a man. In one case, as many as seventeen stone cists were found in one cairn.

Many cairns are of considerable size. Each of three cairns at Memsie, near Fraserburgh, in Aberdeenshire, was about 300 ft. in circumference, and about 40 ft. high. A C. in the parish of Minnigaff, in Galloway, was 891 ft. in circumference. Several of the larger cairns are what is called "chambered"—that is, have internal galleries or cells. Of three large ringed cairns at Clava, on the banks of the Nairn river, near the battlefield of Culloden, one was found to contain a gallery, about 2 ft. wide, leading from the s. side of the C. to a circular chamber in the center, about 15 ft. in diameter, built of unhewn and uncemented stones, each course overlapping the other so as to meet at the top in that sort of rude dome which has received the name of the "beehive house" (q.v.). The Boss C., on the moor of Dranandow, in the parish of Minnigaff, had two galleries crossing each other—each 80 ft. long, 4 ft. wide, and 3 ft. high.

But of all the "chambered" cairns, the most remarkable is that at New Grange, on the banks of the Boyne, near Drogheda, in Ireland. It is 400 paces in circumference, and about 80 ft. high, and is supposed to contain 180,000 tons of stones. In 1699, it was described by Edward Lhwyd, the Welsh antiquary, as "a mount or barrow, of very considerable height, encompassed with vast stones, pitched on end, round the bottom of it, and having another, lesser, standing on the top." This last pillar has disappeared; of the outer ring of pillars, ten still remain, placed at about ten yards one from another. "The cairn," says Mr. Wakeman in his *Archæologia Hibernica* (Dublin, 1848), "in its present ruinous condition, presents the appearance of a grassy hill partially wooded; but, upon examination, the coating of earth is found to be altogether superficial, and in several places the stones, of which the hill is entirely composed, are laid bare. The opening [which is nearly square, and lined by large flags] was accidentally discovered about the year 1699. The gallery, of which it is the external entrance, communicates with a [dome-roofed] chamber or cave nearly in the center of the mound. This gallery, which measures in length about 50 ft., is, at its entrance, 4 ft. high; in breadth about 3 feet. Towards the interior, its size gradually increases; and its height, where it forms the chamber, is 18 feet. The chamber is cruciform, the head and arms of the cross being formed by three recesses—each containing a basin of granite. The sides of these recesses are composed of immense blocks of stone, several of which bear a great variety of carving, supposed by some to be symbolical. The majority of these carvings must have been executed before the stones had been placed in their present positions. The length of the passage and chamber from n. to s. is 75 ft., and the breadth of the chamber from e. to w. 20 feet. Of the urns or basins in the recesses, that to the e. is the most remarkable. It is formed of a block of granite, and appears to have been set upon, or rather within, another of somewhat larger dimensions." The Irish antiquaries believe that the chambered C. of New Grange—"the cave of Achadh Aldai," as it was called, from Aldai, the ancestor of the Tuatha De Danaan kings—was opened and rifled by the Norsemen in 862. About a mile from it, on either side, are other two cairns of nearly equal size, named Knowth and Dowth. The latter was opened in 1847, and found to contain a gallery, a cruciform chamber, a basin or sarcophagus, and carved stones, all of the same type as those of New Grange. Engravings of the sculptures, in both cairns, are given in Mr. W. R. Wilde's *Boyne and Blackwater*, pp. 192-207 (Dublin, 1850), and some of them are obviously of the same character with sculptures found in Scandinavia; at Locmariaker, and at Gavr Innis, in the Morbihan, in Brittany; in one of the cells of a tumulus opened in 1853 at Pickaquoy, near Kirkwall, in Orkney; among the ruins of an ancient fort at the Laws, near Dundee; at the ancient forts at Rowtin Lynn, and Old Bewick, in Northumberland; and on one of the standing stones near Penrith in Cumberland, called "Long Meg and her Daughters."

Cairns are most frequent in stony countries. Where, as in many parts of England, stones are scarce, the barrow or earthen mound came in place of the C., from which it differs only in the materials of which it is made. So also in Scandinavia. Cairns, or *dysser*, as they are there called, are rare in Denmark, but of more common occurrence in Sweden and Norway.

CAIRNES, JOHN ELLIOTT, 1823-75; b. Ireland; educated at Trinity college, studied law, and was admitted to the Irish bar, but passed most of his time in writing for the

press, chiefly upon economical questions affecting Ireland. In 1856, he was appointed professor of political economy in Dublin, and the next year his professional lectures were published under the title *Character and Logical Method of Political Economy*. He next wrote for *Fraser's Magazine* a series of essays on the gold question, induced by the sudden increase of supply from California and Australia. In 1861, he was appointed professor of political economy and jurisprudence in Queen's college, and in the next year published his work on *The Slave Power*. His conclusions were to a large extent verified by the results of the war in the United States then just commenced. In 1866, he was appointed professor of political economy in University college, London. His later years were spent in collecting and publishing his numerous papers, and in writing his chief work, *Some Leading Principles in Political Economy, newly Expounded*. He is regarded as high authority on subjects connected with political economy.

CAIRNGORM STONE, or simply CAIRNGORM, a name often given by jewelers, and particularly in Scotland, to brown or yellow quartz or rock-crystal, because found at Cairngorm, in Aberdeenshire. The same mineral is found in many other localities, as at Olivet near Orleans, in Brazil, and in Siberia. In Cairngorm and the neighboring district of Mar, it occurs both in the granite rock and in the alluvial soil. It differs from common colorless quartz or rock-crystal only in the presence of a very little oxide of iron or manganese, to which it owes its color. It is much used as an ornamental stone. The yellow variety is not unfrequently called topaz, although quite different from the true topaz, which it resembles chiefly in color, having neither its hardness nor its brilliancy. The topaz is, however, sometimes found along with it in the granite and gneiss districts of Mar and Cairngorm. The brown variety is sometimes called **SMOKY QUARTZ**, and when of a good and uniform color is by some preferred to the yellow.

CAIRO, city, port of entry, and co. seat of Alexander co., Ill., at the junction of the Mississippi and Ohio rivers, on 5 railroads; 149 miles s.e. of St. Louis. It is an important market for the products of the Mississippi valley. Intended to be a great commercial centre, its low site subjected it to inundations until it was protected by strong levees and an embankment. During the civil war it was an important depot of supplies. The Ohio river is here crossed by a railroad bridge 58 feet above high water, which cost \$2,500,000. Over 4000 steamboats land at its wharf yearly. It is principally engaged in commerce and manufacturing, and has the Douglass and Summer High Schools, Chase Academy, St. Joseph's Female Seminary, public library, national banks, and daily and weekly newspapers. Pop. '90, 10,324.

CAIRO (Arabic, *Musr el Kahirah*, "the victorious capital"), the capital of modern Egypt, is situated in lat. 30° 2' n., and long. 31° 16' e., in a sandy plain betwixt the right bank of the Nile and the ridge of Mokattam, and near the point of the delta of the Nile. From the foundation of the city in 969, the Fatimite caliphs of Africa, who brought the bones of their ancestors with them from Kairon, reigned for ten generations over the land of Egypt. The caliph Hakem, who built a mosque near Bab-el-Nassr, and who is the supposed founder of the Druse religion, was the third in the succession. In the year 1171, Saladin usurped the throne from the last of the Fatimites. His descendant, Moosa-el-Ashref, was deposed in his turn in 1250; from that time till the year 1517, when the city was stormed and taken by sultan Selim, C. was governed by a succession of Mameluke kings.

The city of C. occupies about 3 sq. m., and is surrounded by a low wall. Of late years it has been greatly improved. It is lighted with gas, and many fine broad streets have been opened through the crowded districts. The bazaars are well and richly supplied. The houses, which are generally two or three stories high, are all built of variegated brick, with interlinings of wood, and have flat roofs. The city is divided into different quarters, one quarter being appropriated to the Turks, one to the Christians, one to the Jews, etc.; so that every religious sect has its own quarter, which is separated from the adjoining one by strong gates at the end of the streets; these are closed at night, and guarded by a porter, who opens the gate when any one wants to pass.

The most remarkable buildings in the city of C. are its minarets and mosques. The minarets are the most beautiful of any in the Levant, of a prodigious height, and built of alternate layers of red and white stone. The most ancient of all the minarets is that attached to the great mosque of sultan Tayloou. This mosque was built in the year of the Hegira 265 (879 A.D.), before the foundation of the city, and consists of an immense cloister or arcade built on pointed arches, being the earliest extant in that form. Another magnificent mosque is that of the sultan Hassan, situated in the place of the Roumayli, near the citadel, and which was finished about the year 1362 A.D. It has two very elegant and high minarets, and the mosque, in consequence of its size, and the thickness of its walls, was frequently seized and made use of as a fortress by the insurgents in the numerous rebellions and insurrections which were always taking place at C. under the rule of the Mameluke kings. Stains of blood are still to be traced on the marble walls of the courtyard.

The population of C. consists of Turks; Arabs, the former conquerors of the land, who form the bulk of the population, all the petty tradesmen and cultivators of the soil being of Arab origin; Copts, who are descended from the original lords of the land, the ancient Egyptians; Jews, Armenians, Syrians, Africans, and Europeans. Pop. '82,

368, 108. The Copts, a mere fraction of the population, completed, in 1867, a fine, lofty, spacious church. Many Europeans and wealthy natives live in the new quarter called Ismailiyeh. In 1876, C. was connected by rail with Heluan, one of the numerous bathing-places lying to the south.

Of objects worthy of note in the environs of C., there may be mentioned the tombs of the caliphs, situated about a mile beyond the walls, which are magnificent and imposing buildings, forming beautiful specimens of Arabian architecture. There is a museum of Egyptian antiquities at Boolak, and in 1897 the khedive laid the cornerstone of a new museum at C. The public gardens, which consist of groves of orange, citron, palms, and vines, are very beautiful. The trade of C. is rapidly increasing. The exports consist mainly of native products, such as ivory, gum, wood, hides, ostrich feathers, cotton and sugar; while the imports are cotton and woolen goods, prints, hardware, cloth, furniture, shawls, indigo, sheep, tobacco, etc. The manufactures of C. embrace silk and cotton fabrics, gunpowder, glass lamps, sugar, sal ammoniac, weapons, and iron ware. C. is a great seat of learning. The government college and the national schools are largely attended, while several thousand pupils attend the theological university attached to the mosque of Ezher. The schools comprise a commercial and juridical school at the Darb Algamâmiz, a school of arts and industry at Boolak (q. v.), and military schools at the Abbasseeyah. The language spoken at C. is Arabic, which, though not the purest, is superior in pronunciation to that spoken in Syria. C. is the official residence of the khedive of Egypt, and the residence of a consul-general from Great Britain, France, etc. C. has railway connection with Alexandria and Suez, and there is also a line to upper Egypt. Steamers ply on the Nile as far as the second cataract. Gas, the telephone, and other modern appliances are in use among the European and official circles.

CAIROLI, BENEDETTO, an eminent Italian statesman, born at Gropello, near Pavia, 1826. He was educated at the University of Pavia, which he left in 1848, to become a volunteer against Austria, and from 1851 to 1859 lived in exile in Piedmont, when he again took up arms for Italian liberty, serving at the siege of Palermo, in the Trentino, and at Monterotunda and Mutino. Though previously reputed an uncompromising republican, and renowned for his antagonism to Vatican and church, after 1876, when the *Left* came into power, he was induced, partly through the influence of his friend Depretis, to accept the constitutional monarchy, and after the accession of King Humbert, was appointed premier in the new ministry of March, 1878. When, in October, that ministry resigned, Signor Cairoli was intrusted with the formation of a new cabinet. On the 17th of November, as the king was driving into Naples, a certain Giovanni Passanante attempted to assassinate him with a poniard, but was prevented by Cairoli, who was in the carriage, and who received a severe wound, while King Humbert escaped with a mere scratch. This act of heroism increased the minister's personal popularity, but did not restore the people's confidence in his administration. In the Chamber of Deputies a motion of confidence in the internal policy of the government was lost by 251 votes against 183, and the ministry resigned, December 11th, 1878. The Depretis ministry, which succeeded, was in turn defeated, in 1879, and the *Left* again came into power under Cairoli, who was, however, forced to reconstruct his cabinet the same year, and to bring in Depretis as minister of the interior. Finally, owing to the unpopularity of the policy pursued in regard to the French expedition to Tunis, the ministry resigned in 1881. Since that time, Signor Cairoli was conspicuous as a vigorous leader of the so-called "historic" *Left*. He died in 1889.

CAISSE, a coffer, box, case, or chest; in finance, a cash-box, or pay-office, or fund for payments. In anatomy, the drum of the ear. The French call a savings bank, "caisse d'épargne."

CAISSON, in military matters, is a name sometimes given to a tumbril or ammunition wagon. It is more frequently applied, however, to a large wooden chest or frame, loaded with powder, shells, or both, and buried several feet deep in the ground under some fortification; this destructive combination is to be blown up if there be danger of the enemy approaching and taking possession of that particular part of the defense-work. The French give the name of *caisson pour les vivres* to a large chest, carried with the army, and capable of containing 800 rations.

CAISSON, in engineering, is a hollow box of iron or wood, open at the bottom, sunk where piers are to be placed. The largest caisson yet sunk was for the tower of the Brooklyn Bridge on the New York side. At the bottom it was 172 ft. long and 102 ft. wide, with an air-chamber 9½ ft. high, the roof 22 ft. thick, and the sides carried up 82 ft. from the lower edge. It had a coffer-dam in the upper part; was built of timber lined with boiler-iron, and bolted together. In its construction there were used of lumber, board measure, 4,200,000 ft., and of iron, including bolts, 620 tons. When completed, it weighed 13,271 tons, and there were 30,000 tons of masonry laid within it. There were two double air-locks extending into the air-chamber, in which were steam-pipes to keep an even temperature. Two shafts passed up through well-holes in the masonry, with an elevator in one, and two spiral stairways in the other. Below the lowest edge of the caisson extended two water-shafts, each 7½ ft. in diameter, in which dredges and scoops grappled the stones and soil, raising their loads to cars above, which conveyed the refuse away. At the same time sand and fine dirt were blown out by air-pressure through 40 or more pipes in various parts of the structure. The interior was illuminated by gas, and constant communication by telegraph was kept up with the

workmen inside. There were four shafts, each 2 ft. in diameter, for the introduction of material for the concrete with which the whole interior was finally filled. The caisson was sunk 78 ft. below mean tide, a work that required a pressure of 34 lbs. per sq. inch, in addition to the normal pressure of air; and to supply this addition, 13 large compressors were used. The earliest caissons for such purposes were used in England in 1738-40 in laying the foundations of the Westminster bridge over the Thames.

CAITHNESS, a maritime co., the most northerly on the mainland of Scotland. It is triangular in shape; length, from n. to s., 40 m.; greatest breadth, 30 m.; area, 686 sq. miles. Except in the w. and s., where the mountain-range (composed of granite and gneiss) dividing C. from Sutherland attains, in its highest point, a height of more than 2300 ft., the general aspect of C. is level and bare, being in great part moorland and destitute of trees, while the sea-coast is bold and rocky, with many bays, inlets, promontories, and caves. On the n. coast are Dunnet head and Duncansby head; and on the w. side of the last-named head is a spot of green turf, called John o' Groat's house, where John de Groot or Groat of Warse settled with his brothers in James IV.'s time, and built a house. There are no navigable rivers in C., and no lakes of importance. The climate is damp and chilly, but snow rarely lies on the plains above a day or two at a time. Thunder is rare, but auroræ are seen almost nightly. There are no manufactures, properly so called, although weaving is carried on to some extent. Coal has not been found in C.; the common fuel is peat. The chief crops are oats, bear, turnips, and potatoes. The parts of the surface under tillage are generally a deep fertile loam on a strong till clay. In the n.e., the soil is sandy. The crops are 20 days later in ripening than in the Lothians. The occupants of many of the small farms divide their time between farming and fishing. There are herring, ling, cod, salmon, and lobster fisheries. The herring-fishery in July and August employs about 1500 boats, a part of which come from other parts of the Scotch coasts. Wick is the chief seat of the British herring-fishery. The average number of barrels cured annually in the ports of C. may be stated at 200,000. Pop. '81, 38,865; '91, 37,177

CAITHNESS FLAGSTONES are dark-colored bituminous schists, slightly micaceous and calcareous, valuable on account of their great toughness and durability for pavements, cisterns, and various other purposes, and accordingly are largely exported. They belong to the old red sandstone, and contain abundant remains of fossil fishes.

CAIUS, Dr. JOHN, the person from whom Caius college, Cambridge, takes its name, was b. at Norwich in 1510. His real name was Kaye or Key, which he Latinized into Caius. He was educated at Gonville hall, university of Cambridge; and at the age of 20, turned into English Chrysostom's *Method of Praying to God*, which was followed by a translation of Erasmus *On True Theology*. He next went abroad, and resided in Italy for several years, studying medicine. On his return to England, he practiced with success at Cambridge, Shrewsbury, and Norwich. Henry VIII. appointed him anatomical lecturer to the company of surgeons in London. In 1547, he was elected a fellow of the college of physicians, of which he was subsequently made president. He also became physician to Edward VI., queen Mary, and queen Elizabeth. In 1557, he obtained permission to elevate Gonville hall into a college, which took the name of Caius college, and of which he became master. This office he held till his death, in July, 1573. His principal work is *A Booke or Counsell against the Disease commonly called the Sweate or Sweatyng Sicknesse*, Anno Do. 1552. C., however, wrote a great number of works on a variety of subjects, critical, antiquarian, and scientific.

CAIUS COLLEGE. See GONVILLE AND CAIUS COLLEGE.

CAIVANO, a t. of southern Italy, in the province of Naples, and 8 m. n. of the city of that name. It was a place of considerable strength in the middle ages, and still retains many remains of its walls and towers, though they have suffered severely in the various revolutions of Naples. Pop. 11,000.

CAJAMARCA. See CAXAMARCA.

CAJATAMBO, a province in the department of Junin, Peru; 1500 sq.m.; pop., 24,750. The region is mountainous and comparatively barren, with a severe climate. There are many remains of ancient towns, aqueducts, etc. The chief town, of the same name, has a pop. of about 4000, and is in a fertile plain at the foot of the Andes, 140 m. n.e. of Lima. The people are employed in spinning wool for sale at Lima.

CAJEPUT, *Melaleuca cajuputi* or *M. minor*, a tree of the natural order *myrtaceæ*, sub-order *leptospermeæ*, from the leaves of which the pungent, aromatic, volatile oil, called *oil of cajeput*, is obtained by distillation. The C. tree is common on the mountains of the Moluccas. It is rather a small tree, with a crooked trunk, thick spongy bark, white wood (whence the name C., properly *kayuputi*, signifying white wood), elliptical-lanceolate alternate leaves, and terminal spikes of white flowers. The greater number of the species are natives of Australia, some of them very beautiful shrubs and frequent ornaments of British hot-houses. Much of the oil of C. of commerce is prepared in the island of Banda. It is said that two sackfuls of leaves yield scarcely three drams of the oil, which is green, transparent, limpid, with a strong penetrating odor, and agreeable only when much diffused.

CAJETAN, or **GAETANI**, **BENEDETTO**. See BONIFACE VIII.

CAJETAN, CARDINAL, 1469–1534, an Italian priest of the Dominican order, whose real name was THOMAS DE VIO, the name Cajetan being assumed by him from his birth-place, Cajeta or Gaëta. He is famous in the history of the reformation as the papal legate commissioned to bring back Luther to allegiance to the church. For this purpose he went to Augsburg in 1518, and Luther was there cited to appear before him. He is reported to have begun by an attempt to intimidate the reformer, but to have ended with an admission of failure, saying that he could not discuss any longer with "that beast; it has two wicked eyes and marvelous thoughts in its head." Luther refused to retract his two propositions; the first, a denial that the treasury of indulgences was filled with the merits of Christ; the second, the view that the receiver of the sacrament must have faith in the grace administered to him. Cajetan's mission thus resulted in widening the breach between Luther and the church. He had been made cardinal in 1517, and in 1523 was sent as papal legate to Hungary. He was employed also on other negotiations. He made a translation of the Old Testament, with a commentary, and wrote a treatise on the authority of the pope, which was answered by the faculty of the University of Paris. He also wrote commentaries upon parts of Aristotle's writings and upon the *Summa* of Aquinas. A collection of his works appeared at Lyons in 1639. See Schillbach, *De vita ac scriptis de Vio Cajetani* (1881).

CALABAR (OLD), a river of Africa which enters the bight of Biafra, about 52 m. w.n.w. of Fernando Po, by an estuary about 9 m. in breadth. It is navigable by steamers for about 200 m. above its mouth, and abounds in crocodiles. The chief towns on its banks are—Duke Town or Old Calabar, situated on its estuary; Creek Town, further up, both seats of British missions; Acoono Coono, and Omun.—**CALABAR (NEW)**, a branch of the Niger, falling into the bight of Biafra, in lat. 4° 30' n., and long. 7° 7' e. It has a bar across its mouth, which prevents the entrance of vessels drawing more than 12 ft., but some miles up it has an average depth of 80 feet.

CALABAR BEAN, a very remarkable medicinal agent, which has been introduced into the new edition of the British Pharmacopœia (1867). It is the seed of *physostigma venenosum*, a twining, half-shrubby plant, a native of western Africa, of the natural order *leguminosæ*, sub-order *papilionaceæ*, nearly allied to the kidney bean, but of a genus distinguished by the hood-shaped stigma, and the deeply-furrowed hilum of the seed. The following are the leading characters of the bean itself: "About the size of a very large horse-bean, with a very firm, hard, brittle, shining integument, of a brownish-red, pale chocolate, or ash-gray color. Irregularly kidney-shaped, with two flat sides, and a furrow running longitudinally along its convex margin, ending in an aperture near one end of the seed. Within the shell is a kernel, consisting of two cotyledons, weighing on an average about 46 grains, hard, white, and pulverizable, of a taste like that of the ordinary edible leguminous seeds, without bitterness, acrimony, or aromatic flavor. It yields its virtues to alcohol, and imperfectly to water." It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft. About twenty years ago, Dr. Christison very nearly fell a victim to his zeal for science in experimenting on some specimens of this bean which had been sent to Edinburgh by some African missionaries, dangerous symptoms having been produced by 12 grains of the kernel which he swallowed. In 1861, Dr. Thomas R. Fraser tried the effects upon himself of doses of 6, 8, and 10 grains. The general symptoms were epigastric uneasiness, great feebleness, dimness of vision, salivation, giddiness, and irregular, feeble, and slow heart's action. About the same time, he made the interesting discovery, that when placed on the eyeball this substance contracts the pupil, and produces near-sightedness; and it is now frequently employed for these purposes by ophthalmic surgeons. In 1864, 50 children were poisoned by eating these beans, which were swept out of a ship at Liverpool. A boy aged six years, who ate six beans, died very speedily. The chief symptoms in these cases were griping, vomiting, and contracted pupils; the face was pale, the eyes bright and protruding, and in trying to walk, the children staggered as if they were drunk. Dr. Fraser, in a paper which he communicated to the royal society of Edinburgh in 1866, maintains that, in mammals, death is generally produced by a combination of syncope (faintness) with asphyxia (suffocation); the symptoms of the one or the other depending on the dose, which, when large, at once destroys the heart's action. It has been used medicinally in small doses (one to ten grains of the powder, or $\frac{1}{10}$ to $\frac{1}{2}$ of a grain of the extract) in chorea, tetanus, general paralysis of the insane, and other diseases of the nervous system. Being now a recognized medicinal agent, it is satisfactory to know that the dangerous and even fatal effects of excessive doses may be prevented by administering belladonna, (night-shade), or its active principle, atropia, as a counter-poison. This fact has been established by Dr. Fraser in a communication to the royal society of Edinburgh, embracing the results of 500 experiments on dogs and rabbits. So unmistakable is the power of the antidote, that it can prevent even three times a fatal dose of the kernel from causing death in those animals. Belladonna has also an opposite action on the eye to that of this substance, as it dilates the pupils and produces long-sightedness. When the pupil is contracted by Calabar bean, it may be dilated to its normal, or to a greater, size by belladonna; and when it is dilated by belladonna, it may be reduced to its normal, or to a less, size by Calabar bean.

CALABASH TREE, *Crescentia cujete*, a tree found in the West Indies and in the

tropical parts of America, of the natural order *bignoniaceæ* (q. v.), suborder *crescentiaceæ*. In height and size it resembles an apple-tree, and has wedge-shaped leaves, large whitish fleshy flowers scattered over the trunk and older branches, and a gourd-like fruit, sometimes a foot in diameter. The wood of the tree is tough and flexible, and is well adapted for coach-making. But the most useful part is the hard shell of the fruit, which, under the name of *calabash*, is much used in place of bottles for holding liquids, and for goblets, cups, water-cans, etc. These shells may even be used as kettles for boiling liquids, and they will bear this several times without being destroyed. They are sometimes highly polished, carved with figures, tinged with various colors, and converted into ornamental vessels. The rinds of gourds are sometimes similarly used, and called calabashes.

CALABA TREE. See **CALOPHYLLUM**.

CALABO'ZO, a t. in Venezuela, 120 m. s.s.w. of Caracas, in the plain w. of the river Guarico; pop. 5600. It is an important point for commerce, but is subject to inundations and extremes of heat. The town has a college and a number of schools.

CALA'BRIA, the s. w. peninsula of the kingdom of Italy, bounded n. by the province of Basilicata. Its greatest length, from the southern border of Basilicata to cape Spartivento is about 160 miles. In its northern part it has a breadth in some places of more than 60 m., which suddenly contracts, between the gulfs of Sant' Eufemia and Squillace, to not more than 16. Its entire area is 5819 square miles, and its pop. in 1895 amounted to 1,338,264. It is traversed throughout its entire length by the Apennine mountains (q. v.), whose summits in the region in the n. of C., known as La Sila, and the Aspromonte, in the s., are crowned with pines, while forests of oak and beech cover their sides. The valleys between the various hills afford rich pasture, especially in the n., to which, in spring-time, whole colonies migrate with their flocks and herds. There is no river of any importance in C.; but the valleys and plains, watered by such streams as there are, are very fertile, yielding wheat, rice, cotton, licorice, saffron, the sugar-cane, etc., and also the vine, orange, lemon, olive, fig, and mulberry, in luxuriance. Iron, alabaster, marble, gypsum, and antimony are among its minerals. The fisheries of its coasts, particularly the tunny and anchovy fisheries, are important, and afford employment to a large number of the population. Manufactures are in a backward state. Silk is the staple article. The district is very subject to earthquakes. For purposes of administration, C. is divided into the provinces of Cosenza, which has a population of 469,839—capital, Cosenza; Catanzaro, with a population of 467,136—capital, Catanzaro; and Reggio, with a population of 401,289—capital, Reggio.

In ancient times, the name C. was given to the s.e. peninsula, nearly corresponding to the modern province of Lecce, no portion of which is included in modern C., which answers to the ancient *Bruttium*. The name C., as applied to the district now known by that name, appears to have originated with the Byzantines some time prior to the conquest of the country by the Normans. A colony of the Vaudois or Waldenses of Piedmont was founded in C. in 1340, and for some time enjoyed great prosperity, but was extirpated in 1560-61. The destruction of this colony is one of the blackest passages of the history of religion in Italy.

The Calabrians are a proud, fiery, and revengeful race. They were long celebrated as among the fiercest of banditti; but the crimes which in former times made them infamous are no longer frequent. They strenuously resisted the power of France during the Napoleonic campaigns, and were not finally subdued until 1810.

CALA DIUM. See **Cocco**.

CALAHOR'RA, a t. in Spain in the province of Logroño, 24 m. s.e. of the city of that name, is situated on the small river Cidacos, about 2 m. from its confluence with the Ebro. C. occupies the site of the ancient *Calagurris*, celebrated in classic history for the obstinate but unsuccessful resistance it offered (78 B.C.) to Afranius, Pompey's legate, when the citizens slaughtered their wives and children for food rather than surrender. C. was the birthplace of Quintilian the rhetorician. It has an old cathedral and a trade in the agricultural produce of the rich district in which it is situated. Pop. about 8800.

CALAIS, a city, port of entry, and co. seat of Washington co., Me.; on St. Croix river at the head of tide water, and opposite to St. Stephen in New Brunswick; the most northeasterly seaport in the United States; and on the St. Croix and Penobscot railroad; 28 miles n. by w. of Eastport. The river is crossed by several bridges, and the New Brunswick and Canada railroad touches at St. Stephen. There is a tide at C. varying from 20 to 30 ft. and steamers of the largest size come and go freely. The St. Croix also furnishes abundant water-power, to which is due the great lumber trade of the city. Shipbuilding is also an extensive business, and there are foundries, machine shops, and dry dock, flour mills, and many other branches of mechanical industry. There are high and grammar schools, public library, electric lights, national and savings banks, a driving park and agricultural association, several hotels, and daily and weekly newspapers. Pop. '90, 7,290. The city was settled in 1779, incorporated as a town in 1809, chartered as a city in 1850, and was nearly destroyed by fire in Aug. 1870.

CALAIS, a seaport t. of France, in the department of the Pas-de-Calais, on the strait of Dover, near its narrowest part, the distance from the town of Dover not being more

than 26 miles. There is here a lighthouse 190 ft. high. In 1879 it was determined to encircle C. with vast new fortifications, and make it once more a fortress of the first class. On the s. and e., low marshy grounds, which those in the city have the means of submerging, stretch up almost to the walls. The town, adjacent country, and port, are commanded by the citadel, which is situated at the w. end of the town, while numerous forts, by their cross-fire, defend the weakest points. The harbor, which was formerly shallow, has been greatly improved, and the port is now accessible to the largest vessels. Being one of the chief ports of debarkation for travelers from England to France, it has steam communication with Dover and London. With the former city it is also connected by submarine telegraph, the cable having been laid as early as 1851. The city, which is entered from the sea by a drawbridge and gate, erected in 1685 by cardinal Richelieu, is square in form; its streets are, for the most part, broad and well paved; and its ramparts form pleasant promenades. Among its objects of interest, the most noticeable is the cathedral, with a fine picture of the "Assumption," by Vandyck. It has become a manufacturing town of some importance. The chief manufactures are bobbin-net (tulle), machine-made lace, hosiery, etc. Numerous mills have been built; steam-engines are multiplying; and the inner ramparts have been removed to make room for factories. Hats and gloves are extensively made. It has also distilleries, salt refineries, and ship-building. C. sends many boats to fish for herring and cod on the coasts of Scotland and Iceland. Water, which used to be scarce, is now brought in abundance from the neighborhood of Guines. Its exports consist of eggs, corn, wine, brandy, etc., and it is the entrepôt for the produce of the district. It also does a large business in petroleum. In 1873 a school of artillery was established in C. Pop. '86, 58,965; '91, 56,867; '96, 56,940.

In the 9th c., C. was but a small fishing-village. In the following c., it was much improved by Baldwin IV., count of Flanders, and enlarged and strengthened by Philippe of France, count of Bologne. After a long siege, it was captured by Edward III. of England, whose hard terms, and the self-devotion shown by six of the citizens, who were saved by queen Philippa, form one of the most interesting passages of history. The English retained it until 1553, when it was captured by the duke of Guise, since which time (with the exception of two years, 1596-98, when it was in the possession of the Spaniards) it has remained in their hands. In 1659, Charles II. of England resided some time here; and about a quarter of a century later, James II. arrived here with French troops for the invasion of England, which the destruction of the French fleet prevented him from accomplishing. Louis XVIII. landed here in 1814, after his exile.

CALAMANDER WOOD, a cabinet-wood of the greatest value, resembling rose-wood, but much surpassing it in beauty and durability. The tree which produces it is *diospyros hirsuta*, a species of the same genus which produces ebony (q.v.); it has oblong obtuse leaves, which are downy beneath, and flowers without stalks and crowded; and is a native of the s.e. of India, and of Ceylon, particularly of the forests at the base of Adam's Peak. But this tree "has been so prodigally felled, first by the Dutch and afterwards by the English, without any precaution for planting or production, that it has at last become exceedingly rare," so that wood of considerable size is scarcely to be procured at any price. It yields veneers of unusual beauty, "dark wavings and blotches, almost black, being gracefully disposed over a delicate fawn-colored ground." Its density is very great, a cubic foot weighing nearly 60 lbs., and it takes an exquisite polish. The name C. W. is supposed to be a corruption of Coromandel wood.

CALAMARY, SQUID, or SLEEVE-FISH, *Loligo*, a genus of cephalopodous mollusks of the order *dibranchiata*, and family *teuthidae*. The body is of an elongated form, firm, fleshy, tapering, and flanked towards its posterior extremity by two triangular fins. The body contains a *gladius*, or internal shell, which is horny and flexible, narrow, and pen-shaped, with the shaft produced in front. The mouth is furnished with eight arms. Calamaries have the power of diffusing a dark-colored fluid around them in the water like the cuttle-fish. The different species are distributed over all parts of the world. Several are found in the British seas. In some seas, however, they abound much more, and form a principal part of the food of some of the larger fishes and of whales. The common C. or squid (*L. vulgaris*) is of a bluish color, speckled with purple. It grows to nearly a foot and a half in length, without reckoning the head and arms, which add to the length about half a foot more. See CEPHALOPODA.

CALAMATTA, LUIGI, 1802-69; b. in Milan; an engraver who became famous by an engraving of the head of Napoleon taken after his death at St. Helena; and also for an engraving of Ary Scheffer's "Francesca da Rimini." His widow, Josephine, was a painter of religious subjects.

CALAMBUCO, a tree found only in the n. part of the island of Luzon, considered superior to teak or live oak for shipbuilding. It is dark and hard, like teak, and is proof against the destructive white ant of the Malay region. Warlike, mechanical, and agricultural tools and implements are made from it. The same name applies to the tree that furnishes the eagle-wood and aloes-wood of commerce, found in Siam and Sumatra. The resin which it yields is supposed to be produced by some disease in the tree, and is used in eastern countries for incense.

CALAMIANES, a group of islands in the Eastern archipelago, in lat. about 11° 25' to 12° 20' n., and long. 120° east. Calamianes, the name of the largest of the group, is

about 35 m. long, and 15 m. broad, elevated and fertile, with abundance of animals, such as deer and hogs. The group, with the northern part of Palawan, forms the Spanish province of C.

CALAMICH'THYS, a cylindrical and extremely slender ganoid fish in the waters of w. Africa, allied to the polypterus of the Nile.

CAL'AMINE, an ore consisting essentially of carbonate of zinc. The name is said to be derived from the Greek and Latin *calamus*, a reed, because when fused it adheres to the base of the furnace in a reed-like form. Its primary form is a rhomboid, and it occurs in small obtuse-edged crystals, also compact and massive. It is white, yellowish-white, brown, green, or gray; is sometimes opaque, sometimes translucent; is brittle, and has an uneven conchoidal fracture. It occurs in beds and veins in rocks of various kinds, but most commonly in limestone. Mendip, Matlock, Alston Moor, Leadhills, and Wanlockhead are British localities. C. is an important ore of zinc. In the duchy of Limburg, in the Netherlands, about 1,500,000 lbs. of it are annually extracted from the mines.

CAL'AMINT, *Calamintha*, a genus of plants of the natural order *labiata*, nearly allied to balm (q.v.) (*melissa*). The COMMON C. (*C. officinalis*, formerly *melissa calamintha*) is not infrequent in England. It has whorls of flowers (*verticillasters*), on forked many-flowered stalks, and serrated leaves, with an agreeable aromatic odor, not unlike that of some kinds of mint. It is used by the country people to make herb-tea, and as a pectoral medicine.

CAL'AMIS; 467-429 B.C.; a sculptor of Greece, who made statues in bronze, ivory, gold, and marble; also famous for his representations of horses.

CAL'AMITE, a genus of fossil plants whose true position has not been satisfactorily ascertained. They appear first in the Devonian rocks, and rise through the intermediate formations to the oolitic series, where they are represented by a single species. They reach their culminating point in the coal-measures, where 39 species have been determined. The tall straight stems rose from a swampy clay soil in profusion in the forests of sigillaria, and formed a striking and characteristic feature in the coal flora, though they supplied little material for the structure of coal. They are hollow-jointed cylinders, with longitudinal furrows, giving the fossil the appearance of *equisetum*; from this resemblance, botanists have generally considered them as huge "horsetails." Hooker has been unable to detect any traces of structure, in carefully prepared specimens, or the presence of those siliceous stomata which characterize *equisetum*, and which would have been preserved in the fossil state, and Fleming has shown that the furrows are markings on the interior cavity. While, therefore, it is certain that they are not "horsetails," the absence of fructification makes every attempt to give them their position but guess-work. Hooker supposes them nearly allied to ferns, or club-mosses; Brongniart ranks them among gymnospermous dicotyledons. The upper part of the stem, and the foliage, if any, have not been noticed. The root termination was conical, the joints decreasing downwards in size and length. From the scars on the upper portion of each joint, there proceeded filaments, which were supposed to be leaves, but are really roots. See *illus.*, COAL AND ROCK SALT, vol. IV.

CAL'AMUS, the reed pen which the ancients used in writing, was made of the stem of a reed growing in marshy places, probably *arundo donax* (see REED), of which the best were obtained from Egypt. The stem was first softened, then dried, and cut and split with a knife (*scalprum librarium*), as quill pens are made. To this day, the orientals generally write with a reed, which the Arabs also call *kalâm*.

CALAMUS, a genus of palms. See RATTAN and DRAGON'S BLOOD.

CALAMUS, a name sometimes given to the sweet flag (*acorus calamus*). See ACORUS.

CALAMUS (Greek), a reed-flute supposed to be similar to the syrinx (q.v.), or Pan-pipes. From *calamus* the *calamautis*, a player of reed-flutes, is derived, and also the words *calameau* and *shawm*.

CALAMUS AROMATICUS, the name given by the ancients to a plant to which they ascribed important medicinal virtues. It is by no means ascertained what the plant is; the most probable opinion appears to be that of Dr. Royle, who supposes it to be one of the sweet-scented grasses which yield the grass-oil (q.v.) of India, to which he has given the name of *andropogon calamus aromaticus*. See LEMON-GRASS. The C. A. of the Greeks and Romans came from the east. The *sweet calamus* and *sweet cane* mentioned in Scripture (Exod. xxx. 23, and Jer. vi. 20) are probably the same with the *calamus aromaticus*.

CALAMY, EDMUND, an eminent English divine, was b. in London, 1600; studied at Pembroke hall, Cambridge, where he attached himself to the Calvinistic party; and afterwards became domestic chaplain to the bishop of Ely. In 1626, he was appointed lecturer at Bury St. Edmunds, but resigned his office when the order to read the *Book of Sports* began to be enforced. In 1639, he was chosen minister of St. Mary's, Aldermanbury, London. He now entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnus*, a work intended as a reply to Bishop Hall's

Divine Right of Episcopacy, and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles, and the protectorate of Cromwell, and did not hesitate to avow his attachment to the royal cause. He was one of the deputies appointed to meet Charles II. in Holland, and congratulate him on his restoration. His services were recognized by the offer of a bishopric, which he refused from conscientious scruples. The increasing tyranny and intolerance of the high church party compelled him give up even his royal chaplaincy. He died Oct. 29, 1666.—Two of his sons were educated for a religious profession: the one, Dr. BENJAMIN C., became a high churchman, and wrote *A Discourse against a Scrupulous Conscience*; the other, EDMUND C., was ejected for non-conformity, and had a son, also named Edmund, who acquired some reputation as the biographer of the ejected clergy.

CALAMY, EDMUND, D.D., 1671–1732; an English non-conformist clergyman, who arranged for the press *Baxter's Life and Times*, and wrote *Defense of Modern Non-conformity*; *The Non-conformists' Memorial*; and published many sermons.

CALAND, or **KALAND**, a brotherhood of Roman Catholics devoted to charitable and devotional works, dating from the 13th c., and of considerable extent in Germany, Switzerland, and France. It degenerated so far that it was suppressed before the reformation, its property being confiscated for public purposes.

CALAND, PIETER, b. Holland, 1826; an engineer, and son of an engineer; author of works on encroachments of the sea, and the effect of the sea on rivers; but better known for his improvements in the communication of Rotterdam with the ocean, whereby he replaced a tortuous and difficult route by one easy and direct.

CALANDO, in music, an Italian expression, meaning diminishing by degrees from forte to piano; it differs from the *decrescendo* or *diminuendo*, as the tempo, at the same time, is slightly retarded, but not so much as in *ritardando*. The proper performance of the C. is purely a matter of good taste and feeling, depending on the performer.

CALANDRA. See CORN WEEVIL.

CALANDRONÉ, a wind-instrument used by the Italian peasants, on which they play simple melodies, and also sometimes accompany their national songs. It has the holes of the common flute, but the intonation is produced as in the common pipe.

CALANUS, a Hindu philosopher, whose real name, according to Plutarch, was Sphines. He was for some time in the camp of Alexander the Great, but having become seriously ill, he was burned alive at his own request.

CALAS, JEAN, a Frenchman, remembered as the unhappy victim of fanaticism and the shocking maladministration of justice, was b. at Lacaparde, in Languedoc, Mar. 19, 1698. He lived as a tradesman in Toulouse, where he had a very good reputation. One evening after supper (Oct. 13, 1761), the eldest son of the C. family, Marc Antoine, a youth addicted to gambling, and subject to fits of deep melancholy, was found hanged in the warehouse. There was not a shadow of a reason for doubting that the unhappy young man had committed suicide; but popular rumor accused the father, or other members of the C. family, of murdering the eldest son, "because he had contemplated conversion to Catholicism." It was also asserted that a young man named Lavaysse, who was in the house on the fatal evening, had been dispatched "by the Protestants of Guyenne to perpetrate the murder." The clergy exerted all their influence to confirm the populace in their delusion. At Toulouse, the White Penitents celebrated with great solemnity the funeral of the young man, and the Dominican monks erected a scaffold and placed upon it a skeleton, holding in one hand a wreath of palms, and in the other an abjuration of Protestantism. The family of C. was, in consequence of the popular excitement, brought to trial for the murder, and several deluded and (most probably) some bribed witnesses appeared against them. A Catholic servant-maid, and the young man Lavaysse, were also implicated in the accusation. C., in his defense, insisted on his uniform kindness to all his children; reminded the court that he had not only allowed another of his sons to become a Catholic, but had also paid an annual sum for his maintenance since his conversion. He also argued from his own infirmity that he could not have prevailed over a strong young man, and referred to the well-known melancholy moods of the deceased as likely to lead to suicide; and, lastly, he pointed out the improbability that the Catholic servant-maid would assist in such a murder. But all his arguments proved unavailing, and the parliament of Toulouse sentenced the wretched man—by a majority of 8 votes against 5—to torture and death on the wheel! With great firmness and protestations of his innocence to the last, the old man died on the wheel, Mar. 9, 1762. His property was confiscated. His youngest son was banished for life from France, but was captured by the monks, and compelled to abjure Protestantism. The daughters were sent to a convent. The young man Lavaysse was acquitted, and the widow of C. escaped into Switzerland, where she was so fortunate as to excite the benevolent interest of Voltaire, who brought the whole affair before the public, and, in his book *Sur la Tolérance*, proved that C. had fallen a victim to religious hatred and popular fanaticism. A revision of the trial followed, and, after

full investigation, the parliament at Paris declared (Mar. 9, 1765) C. and all his family innocent. Louis XV. gave to the bereaved family the sum of 30,000 livres; and the chief magistrate of Toulouse was degraded from his office and fined. See Coquerel, *Jean Calas et sa famille* (1870).

CALASA'YA BARK. See CINCHONA.

CALASCIBET'TA, or **CALATAS-CIBETTA** (Saracenic = castle of Xibeth, or Scibet), a t. of Sicily, near its center, 54 m. s. e. of Palermo, in the province of Caltanissetta. The town is mean and dismal looking, and is built on a steep and isolated height, the summit of which is 2,570 ft. above the sea, and commands a magnificent view. It was founded in 1080. The only object worthy of notice is the tower of the principal church, which is of early architecture. Pop. about 6,600.

CALA'SIO, **MARIO DE**, 1550-1620; an Italian scholar, doctor of theology and professor of Hebrew in Rome, who made a Hebrew dictionary and grammar. He devoted 40 years of his life to a great work called *Concordantia Sacrorum Bibliorum Hebraice*, which was published after his death, and several times reprinted. It was much praised by Protestants as well as Roman Catholics. The Hebrew words comprised the body of the work, but the Latin version was also given, and in the margin the differences between the Vulgate and Septuagint versions were shown.

CALASPARA, a t. of Spain, in the province of Murcia, 40 m. n.w. of the city of that name. The inhabitants, numbering 5,200, are chiefly engaged in agricultural pursuits.

CALATABELLO'TA. See CALTABELLOTA.

CALATAFIMI, a t. of Sicily, in the province of Trapani, situated 8 m. s.w. of Alcamo, in a very fertile district. It is ill-built, and has a ruinous old Saracenic castle, Kalat-al-Fimi, from which it derives its name. There is a remarkable Mosaic altar in the church of Santa Croce. Here, in 1860, Garibaldi's troops defeated the Neapolitan soldiers. Pop. 10,000.

CALATAGRIRONE', or **CALTAGRIRONE'**, a city of Sicily, in the province, and 34 m. s.w. of the city, of Catania. It is well built, with wide streets, and has the fame of great wealth. It has manufactures of cotton fabrics and pottery. Pop. about 27,000.

CALATANAZOR', a t. of Aragon, Spain, about 10 m. s.w. of Soria. It is celebrated for a great victory over the Christians obtained by Al-Mansur in 1001.

CALATAYUD', a city of Aragon, Spain, situated on the Jalon, near its junction with the Jiloca, about 48 m. s.w. of Saragossa. It is built at the base of two rocky ridges, and out of the ruins of ancient *Bilbilis*, which lay about 2 m. to the east. The city is divided into a new and old portion, the former of which is composed of mean old buildings. The latter has some good streets and handsome squares. C. has a noble old castle, and among its other most noteworthy public edifices are the two collegiate churches and the Dominican convent. In the neighborhood are some curious stalactitical caves. It has manufactures of linen and hempen fabrics, woollens, paper, leather, etc., and a trade in agricultural produce. Pop. 11,055.

CALATRA'VA, an order of knighthood in Spain, instituted at Calatrava (q.v.). The statutes of the order, framed by the chapter-general of the Cistercian monks, were sanctioned by the bishop of Toledo in 1164, and afterwards by the pope. At subsequent periods, many privileges were added. After the death of the king, their patron, some of the knights were no longer willing to obey the abbot, and they consequently separated themselves from the monks, and elected a grand-master, Don Garcías de Redon. At a later period, they again united themselves to the Cistercians, after they had gained rich possessions from the Moors both in Spain and Portugal. When Castile had fallen into anarchy, and the other kingdoms were exhausting themselves by internal feuds, the war against the unbelievers was almost entirely carried on by the knights of Calatrava. Their almost uniform success, however, gave rise to rashness; the knights were defeated by emir Jacob ben Yuseff, nearly all of them perished, and Calatrava was occupied by the Moors. After this disaster, the knights transferred their seat to the castle of Salvatierra, by the name of which they passed for a long time afterwards. A truce of 12 years having been concluded, during which the order revived, the knights were able, at the battle of Las Navas de Tolosa, in 1212, again to turn the tide in favor of the Christians. They then returned to Calatrava. Notwithstanding their splendid achievements, the knights of C. never possessed the vast wealth of their brethren of St. James of Compostella (q.v.), a fact which is probably to be accounted for by their having ceded a part of their conquests to the orders of Alcantara and Aviz. But their grand-masters, who were chosen from the highest families in Spain, were very powerful, and exercised a vast influence on public affairs. They did not, however, escape the jealousy of the crown. Two of them were accused of treason, and died on the scaffold; and on the death of the 13th grand-master, in 1489, the administration of the order was transferred to the king by a bull of pope Innocent VIII. By way of compensation for the loss of their independence, the knights were permitted to marry once, though they were still bound to

make vows of poverty, obedience, and conjugal chastity; and latterly to profess belief in the immaculate conception. Their original costume consisted of a coat of white mail, with a white scapulary, a black cap, and a pilgrim's hood; but this dress the anti-pope Benedict XIII., in 1397, granted them permission to exchange for a civil apparel. Their present costume is a white mantle, with a red cross cut out in the form of lilies upon the left breast; while the cross of the order has the same symbol on a silver ground. Two convents for nuns were attached to the order, and were at one time richly endowed. The nuns, attached to the order of C. in 1519, wore the dress of Cistercian nuns, with the cross of the order on the left side of the capoch, fastened to the scapulary.

CALATRAVA LA VIEJA, a ruined city of Spain, situated on the Guadiana, about 12 m. n.e. of Ciudad Real. In the middle ages it was a strongly fortified place, but nothing now remains but a single tower. Its defense against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the order of the knights of Calatrava, long one of the most honorable in Spain. The town was called C. la Vieja, or Old Calatrava, in order to distinguish it from the convent of the knights of the order of Calatrava, erected in the neighborhood in 1214, and which was called Calatrava la Nueva.

CALAVERAS, a co. in n. California, on the Calaveras, Stanislaus, and Mokelumne rivers, and the Southern Pacific railroad; 980 sq. m.; pop. '90, 8882, including Chinese. Gold and copper mining are the leading occupations, with agriculture. The grove of big trees is in this county. Co. seat, San Andreas.

CALAVE'RAS, a river in n. California, running from the Sierra Nevada w. to the San Joaquin, on the border of Sacramento county.

CALBURGA, a t. of the Nizam's dominions in Hindustan, about 110 m. to the w. of Hyderabad. It stands on a tributary of the Beemah, which is itself a tributary of the Kistna or Krishna. It has been successively the capital of Hindu and Mohammedan sovereignties.

CALCAIRE GROSSIER (Fr. "coarse limestone"), the French representative of the Bracklesham eocene beds. It consists of compact limestones, with seams of chert, and intercalated marls and freestones. The fossils are fresh water and marine mollusca; so abundant are they that in one spot near Grignon no less than 400 distinct species have been procured. Associated with the fresh-water remains are the bones of reptiles and mammalia.

CALCAIRE SILICEUX (Fr. "siliceous limestone") is the French representative of the Bembridge eocene strata. These compact siliceous limestones extend over a wide area in the Paris basin. The few fossils they contain are fresh water and land shells.

CALCAREOUS, in chemistry, is a term applied to substances containing much lime (Lat. *calx*). Thus, *C. waters* are those which hold in solution much carbonate and sulphate of lime, and which are generally known as hard waters, and form a deposit in kettles and other vessels when heated therein. *C. rocks* are those in which lime forms the prevailing element. They may be chemically formed as in the case of tufas, where a saturated solution of carbonate of lime in water is deposited from evaporation or other causes; but they are generally aqueous rocks, the materials of which are supplied by animal remains. Thus, many rocks, like the mountain-limestone, are composed of shells, corals, and encrinites; while others, like chalk, consist of foraminifera and fragments of other minute testacea. A crystalline structure, varying in degree from the partially crystallized carboniferous limestones to the saccharine statuary marble, is produced in calcareous rocks by metamorphic action. Oolite is a variety of limestone composed of small egg-like grains resembling the roe of fish. The existence of lime in rocks can always be detected by the application of dilute nitric or muriatic acid, when it effervesces from the liberation of the carbonic acid. Pure lime is obtained from calcareous rocks by calcining them—i.e., by driving off the carbonic acid and other volatile matter by heat.—*C. soils* are produced from the disintegration of calcareous rocks. When the rocks are perfectly pure, they generally yield barren soils, as in many chalk and limestone districts of Britain; but when the lime is mixed with clay, so as to form marl, and has a little vegetable matter added, it forms an excellent though rather light soil. Calcareous soils are difficult of drainage, owing to the property that soft lime has of retaining water, although it easily yields it up by evaporation. Such soils are consequently soon dry at the surface after rain, but yet rarely suffer severely from drought.

CALCAREOUS SPAR, or CALC-SPAR, the name usually given by mineralogists to carbonate of lime, rhombohedral in its crystallization. It differs from arragonite only in crystallization. See ARRAGONITE. C. S. occurs in all geological formations, and is one of the most abundant of all minerals. It often completely fills cavities in rocks; and although it has been prevented by want of space from assuming a crystalline form is readily divided by the knife and hammer into rhomboids, the primary form of its crystals being a rhomboid, of which the greatest angles are 105° 5'. Its secondary forms are more numerous than those of any other mineral. More than 700 have been observed. One of the most common, a rather elongated pyramid, is sometimes called *dog-tooth spar*

C. S. is colorless and transparent, except in consequence of impurities which may be present in it; and when perfectly transparent, it exhibits in a high degree the property of double refraction of light, which was first discovered in it by Bartholinus. The presence of foreign substances frequently renders C. S. gray, blue, green, yellow, red, brown, or even black.

The name *Iceland spar* has often been given to C. S., at least to the finest colorless and transparent variety, because it is found in Iceland, massive in trap-rock. *Slate spar* is a lamellar variety, often with a shining, pearly luster, and a greasy feel, of which Wicklow in Ireland, and Glen Tilt in Scotland are localities.

CALCAREOUS SPRINGS, springs charged with calcareous matter which is deposited in the form of incrustations. Such deposit is called calcareous tufa, and takes the form of other substances inclosed, such as leaves, twigs, and branches of trees. When freshly quarried it is easily shaped, and is therefore convenient for building. The temples of Paestum are of this material, and the stone has acquired great solidity and strength. In central New York such deposits are common, forming the marl below swamps and in the bottoms of ponds. One of these springs at Clermont, France, has formed a deposit of white concretionary limestone 240 ft. long, 16 high, and 12 wide.

CALCAREOUS TUFA, **CALC-TUFF**, or **TUFACEOUS LIMESTONE**, a mineral which in its chemical composition is nearly identical with limestone and marble; but is distinguished by its spongy and cellular structure. It is generally rather soft, brittle, and friable, but sometimes it is sufficiently hard to be used as a building-stone. The *travertino*, used for building at Rome, is a hard calcareous tufa. The color of C. T. is generally yellowish-gray, sometimes yellow or yellowish-brown. It occurs massive, or assumes many uncrystalline forms, as tubular, botryoidal (like clusters of grapes), cellular, etc. Sometimes it incrusts animal and vegetable remains. It is frequent in the neighborhood of calcareous springs. It is sometimes used as a filtering-stone.

CALCAR, or **KALCKER**, JAN VAN, 1499-1546; a painter, disciple of Titian at Venice, and perfected by studying Raphael; so good an imitator of Titian that his works can scarcely be distinguished from those of that master. One of his pieces is a "Nativity," representing angels around the infant Saviour, so arranged that the light by which they are seen comes wholly from the child.

CALCASIEU, a parish in s.w. Louisiana, situated on the Texan border, containing about 3410 sq. m.; pop. '70, 6733—1457 colored; in '90, 20,176. The surface is level in broad savannahs, and the soil very productive in corn, sugar, molasses, and cotton. Judicial seat, Lake Charles.

CALCASIEU, a river in Louisiana, about 200 m. long, running into the gulf of Mexico. Near its mouth is a broad expansion called C. lake. The river is not navigable.

CALCED ONY. See **CHALCEDONY**.

CALCEOLA'RIA (Lat. *calceolus*, a little shoe), a genus of plants of the natural order *scrophulariaceæ* (q.v.), of which there are numerous species, natives of South America, chiefly of that part of the Andes which is more than 9600 ft. above the sea, a few of them reaching almost to the utmost limits of vegetation; although some are found in lower and warmer situations, and some in the southern extremity of the American continent. They abound so much in some parts of Chili and Peru, as to give a peculiar aspect to the landscape. The calyx in this genus is 4-partite; the corolla, 2-lipped; the lower lip remarkably inflated, so as to form a bag; and the shape of the whole in some species considerably resembling that of a slipper. There are only two fertile stamens, and the capsule is semi-bivalvular with bifid valves. Some of the species are shrubby, some herbaceous, almost all the herbaceous species being perennial. Many of them have corymbs of numerous showy flowers. Yellow is the color which chiefly prevails in the flowers of the original species, and next to it purple; but the art of the gardener has succeeded in producing varieties and hybrids which exhibit many other rich and delicate tints. Calceolarias have been florists' flowers since about 1830, the curious appearance of the flowers combining with their beauty to render them attractive, and in no genus is the production of hybrids more easily or frequently effected. They are easily propagated by cuttings. Few plants require more liberal supplies of water. They are generally treated in America as half-hardy or as greenhouse plants.—Some of the species are used in South America for dyeing. The roots of *C. arachnoidea*, a parent of many of the hybrids in our gardens, are largely employed in Chili, under the name of *relbun*, for dyeing woolen cloths crimson.

CALCHAS, a Greek soothsayer in the time of the Trojan war who foretold the length of the siege, and when the fleet was detained at Aulis by adverse winds, demanded the sacrifice of Iphigenia. He is said to have died from vexation on being surpassed in prophecy by another soothsayer called Mopsus.

CALCINA'TION, or **CALCINING** (see **CALX**), is the process of heating or roasting in furnaces or in heaps the various metallic ores. It is resorted to as the first stage in the extraction of the majority of the common metals from their ores, and is essentially a process of oxidation.

CALCIUM is the metal present in chalk, stucco, and other compounds of lime. It may be obtained by passing a powerful current of voltaic electricity through fused chloride of C., CaCl_2 , when the metal separates in minute globules. It is a yellowish-white metal, can be rolled into sheets, and hammered into leaves, and is intermediate between lead and gold in hardness. It is represented by the symbol Ca, has the atomic weight or equivalent 20 (new system, 40), and has the density 1.578, or nearly half as heavy again as water. At ordinary temperatures, it slowly tarnishes by oxidation; and when placed in contact with water, it rapidly decomposes the water, H_2O , forming lime, CaO , whilst hydrogen escapes. To be retained bright, C. must be kept under the surface of naphtha. At a red heat, it melts and burns with a dazzling white light, accompanied by scintillations. See **LIME**.

CALCRAFT, WILLIAM, d. 1879; the official executioner or hangman of London; a person of quiet and even gentle manners, who was looked upon by the ignorant as some fearful being quite out of the natural order of humanity. As public executions were stopped in 1860 his fame declined, and little was heard of him except through the exaggerated reports of the ignorant. The price for hanging was fixed at 14s. 6d., of which 7s. 6d. was the fee, 4s. 6d. for stripping the body, and 2s. 6d. for the use of the shell (coffin). C. received that price regularly; he made much more by traveling expenses, perquisites, etc. He died in financially comfortable circumstances. Bull, (phenomenon unknown), the first English hangman whose name survives, lived in the 16th century. The first person hanged in England was Maurice, a nobleman's son. He was executed in 1241, for piracy. Before C., Jack Ketch was the most famous of executioners. He executed, among others, lord William Russell and the duke of Monmouth. C. had retired from office some years before his death on account of advancing age.

CALC-SINTER, a mineral, chemically identical with the purest marble and calcareous spar, but peculiarly characterized by its fibrous structure. It is formed from water holding carbonate of lime in solution, and occurs generally incrusting the roofs, walls, and floors of caves, particularly those in limestone rocks; often assuming curious and even fantastic forms. Macalister's cave, in the isle of Skye, and the limestone caves of Derbyshire, are the most celebrated British localities. But the stalactitic cave of Antiparos, in the Grecian archipelago, is a far more famous locality for this mineral, which is often called *calcareous alabaster*, and used for the same purposes with the true alabaster (q.v.), to which it is in some respects preferable, particularly as not being liable to injury from exposure to the air. Volterra, in Tuscany, is another very famous locality for calc-sinter.

CALCULATING MACHINE. The most remarkable application hitherto made of machinery, is perhaps that through which it has been used to relieve the scientific inquirer to a very great extent of the fatigue of manipulating figures, which consumes so much of his time and energies. Various machines have been constructed for this purpose, differing in the extent of their faculties—to use words more suitable to thinking beings than to engines—and somewhat in the principles of their construction. By the *arithmometer*, for instance, a machine invented by M. Thomas of Colmar, all ordinary arithmetical operations are executed without fatigue to the operator; and by a machine contrived by M. M. Scheutz, which rests on the principle of *differences* (q.v.), on the turning of a wheel, the successive terms of any series whose law may be confided to it, are produced—the machine at the same time *printing* a large proportion of its results, and thus providing for the accuracy of its tables. It is a fact of which the English should be proud that an Englishman, Mr. Babbage, is universally acknowledged as the instigating and guiding genius in the progress of these remarkable inventions. Among his inventions was a *difference engine*, of very comprehensive powers, indeed capable of managing series so complex that the differences of its terms do not reach zero until we ascend to the seventh order (*vide art. DIFFERENCES, CALCULUS OF*). An immense range of nautical and astronomical tables lie within the limits just defined, and the machine further tabulates approximately any series whatever that can be treated by the *method of differences*. While engaged in constructing the *difference machine*, Mr. Babbage, probably through his increased experience of the capabilities of machinery, was led to form a new conception—that, namely, of the *analytical machine*. He actually succeeded so far as to devise the means of making his machine perform all the elementary operations of addition, subtraction, multiplication, and division; and it is clear that all changes that can be produced on quantity are merely combinations of these. If, then, he could but have made his machine perform these operations at command, and according to any special order, it could have clearly developed any function whatever whose law is ascertained and fixed. A solution of this difficulty was suggested by the Jacquard loom (q.v.), in which the *cards* oblige a machine capable of working *any* pattern to work out one particular pattern; and Mr. Babbage having succeeded so far as to form a machine capable of executing any development, expected, by means of *cards of operations*, to compel his C. M. to work according to one fixed law, and no other. Government, however, did not see its way to make the further grants required for this machine, and at Mr. Babbage's death in 1871, nothing further had been done towards its completion. The *difference machine* is now lying, an unfinished curiosity, in the

museum of King's college, London. Both machines will be found described in the third volume of Taylor's *Scientific Memoirs*. The difference engine, constructed by Grant for the university of Pennsylvania is very much less expensive than Babbage's, and less complicated than Scheutz's, though provided like it with an apparatus for printing the results.

A simpler form of calculating machine, the well-known cash register, is now in use in a great many stores for the purpose of keeping account of the daily sales and the total amount of money deposited in the cash-drawer during the day. These machines perform only the operation of addition, and in some cases are provided with a printing mechanism which prints the amount registered at any one operation of the machine. The total of the amounts registered at any time is shown on a dial.

Another type of C. M. which has come into considerable use since 1895 is known as the calculagraph and is designed to compute and record elapsed time and also the value of such time in dollars and cents. The machine has an eight day clock, on each side of which is a handle, and beneath the clock dial is a slot into which a card may be inserted. The calculations are printed on this card by means of the two handles. When the right-hand handle is pressed down the time indicated by the clock dial is printed on the card, and if the same card be inserted in the machine at any subsequent time and the left hand handle be pressed down, the machine automatically subtracts the former time from the latter and prints the difference or elapsed time in figures, as hours, minutes and half minutes. The machine in this form is adapted to a large field of usefulness as, for example, where labor is employed and paid by the hour, for recording the time of races, and is in quite extensive use for timing telephone conversations over long-distance lines.

Another refinement has been added to these machines, by means of which it computes the value of the elapsed time in dollars and cents and prints the result. It may be used, for example, to produce vouchers for the pay-roll of workmen who are paid by the hour at some uniform rate per hour. The operation of this machine is to multiply the elapsed time in hours and fractions of an hour by the rate per hour, and to print the result in dollars and cents. A similar instrument is also made which calculates charges of a certain amount for one hour and a less amount for succeeding hours; as 50 cents for the first hour and 25 cents for each succeeding hour. Any number of separate calculations can be made without reference to the order in which they are commenced.

CALCULUS, or **STONE** (in medicine), a hard concretion formed within the animal body, in consequence of the deposition in the solid form of matters which usually remain in solution. See **CONCRETION**. The concretions most commonly termed calculi are those formed in the kidneys or bladder (*urinary C.*); and those formed in the gall-bladder or biliary ducts (*biliary C.*). Both of these give rise to very painful symptoms, and may even threaten life.

Biliary C., or *gall-stone*, may generally be presumed to exist when excessively severe pain suddenly arises in the right side beneath the border of the ribs, and when in a few hours jaundice comes on, showing that some obstruction has existed to the outward flow of the bile. But the absolute proof that these symptoms depend on C. is often wanting. The pain is fortunately transitory, but is more severe while it lasts than almost any other known form of suffering, unless it be that of a C. in the kidney and ureter. It may be relieved by large doses of opium, but the remedy requires to be cautiously given, as even in medical hands fatal accidents have occurred. Gall-stones, when impacted in the ducts, sometimes have proved fatal; but much more frequently they find their way, sooner or later, into the intestines. They are almost invariably composed of cholesterine (q.v.), with coloring matter and mucus, arranged in layers in a semi-crystalline disposition.

Urinary C. is a disease of all ages, but most common in advanced life and in the male sex. It is also very frequent in gouty persons, or among those who pursue sedentary occupations and live freely. It is rare among those who live much in the open air, or who take much violent exercise, and use little animal food and wine. Among sailors, it is peculiarly rare. In certain parts of the country, the disease is said to be frequent, as in Norfolk, and perhaps along the e. coast of Scotland. In India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is by no means uncommon. It would appear, therefore, that the predisposing causes of C. are still very imperfectly understood. In its early stages, the disease usually presents itself in the form of *gravel*, shown by the passage of numerous very small portions of gritty concretions, which may be observed in the urine as a deposit like sand, or like small grains of Cayenne pepper. When such deposits occur frequently, especially if they are present at the time of passing the urine, and not merely after it has cooled, there is reason to apprehend the formation of calculus. If, in these circumstances, there are pains of a dull character in the loins, with occasional twinges of sharper suffering, no time should be lost in seeking medical advice. If a fit of very severe pain should occur in a person for some time affected with gravel, if the urine be bloody, if agonizing twinges, commencing in the loins, sting downwards into the thigh or the groin, it is probable that a stone has already formed in the kidney, and is being displaced towards the bladder. C. in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downwards from the

kidney; but unless removed or evacuated, the C. is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder, however, should never be taken for granted without a surgical examination, as all the symptoms are deceptive in certain cases. The most striking, and perhaps the most trustworthy evidence of stone in the bladder, apart from the use of the sound (see LITHOTOMY), is smarting and burning pain experienced after the bladder has been emptied, together with occasional temporary stoppage in the flow of urine. The correct appreciation of all the symptoms, however, demands considerable familiarity with such cases.

The discovery of the tendency to urinary C. at an early period of its growth, has been greatly aided by the use of the microscope and of chemical tests. Generally speaking, it may be said that whenever the urine, after standing for a few hours, can be observed to contain more sediment than a very slight cloudiness towards the bottom of the vessel, there is room for careful inquiry into the existence of some derangement of the health. But all sediments are not equally apt to determine C., nor is the treatment of the different kinds of sediment at all similar; care should therefore be taken to determine, from time to time, whether the character of the sediment may have undergone a change, so that the treatment may be adapted accordingly.

The chief varieties of urinary C. are—1. Uric acid (red sand); 2. Urates of ammonia, soda, lime, etc. (brick-dust sediment); 3. Phosphates of ammonia and magnesia, lime, etc.; 4. Oxalate of lime; 5. Carbonate of lime (chiefly in domestic animals); 6. Cystine; 7. Xanthic oxide (a very rare form, discovered by Dr. Marcet). Calculi are frequently found to be composed of numerous successive layers, having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other, and form what is called an alternating calculus.

When C. has once fairly formed in the urinary passages, it seems probable that no absolute cure exists except the removal of it, if possible, from the body (see LITHOTOMY and LITHOTRITY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consist in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. See URINE.

CALCULUS, THE INFINITESIMAL, otherwise sometimes called the transcendental analysis, is a branch of mathematical science which commands, by one general method, the most difficult problems in geometry and physics. The merit of the invention of this powerful mathematical instrument has been claimed for Leibnitz, but is undoubtedly due with equal justice to Newton, who laid the foundations for it in that celebrated section of his *Principia*, in which he demonstrates the chief theorems regarding the ultimate values or limits of the ratios of variable quantities. The view of one class of writers is, that these distinguished men invented the C. simultaneously and independently; and it is the fact that Leibnitz's system is unfolded from premises differing somewhat from those of Newton. See FLUXIONS. Another class of writers hold that Newton is the real inventor, and that to Leibnitz no more can be conceded than that he was the first who, using the suggestions of Newton's genius, gave a systematic statement to the principle of the transcendental analysis, and invented its appropriate symbolic language. He had the doctrine of limits before him when he wrote, and did little more than unfold more fully the logic of the processes therein suggested, and exhibit them in algebraical forms.

The infinitesimal C., both in its pure and applied forms, whether of geometry or mechanics, is a branch of the science of number; its symbols are of the same kind, are operated on according to the same laws, and lead to analogous results. It differs from the other branches of the science of number, such as arithmetic and algebra, in regarding number as continuous—i.e., as being capable of gradual growth and of infinitesimal increase, whereas they deal with finite and discontinuous numbers. It differs from ordinary algebra in another respect. In the latter, the values of unknown quantities, and their relations with each other, are detected by aid of equations established between these quantities *directly*; in the C., on the other hand, the equations between the quantities are not directly established, but are obtained by means of other equations primarily established, not between them, but certain derivatives from them, or elements of them. This artifice is most fertile, for it can be shown that in the great majority of cases the relations of quantities concerned in any problem may more easily be inferred from equations between these their derivatives or elements than between themselves.

It will be seen that the C. created a new notion of number—as continuous or growing. It is now necessary, in order to a proper conception of it, that a precise idea should be formed of a *differential*. The simplest idea of a differential is unquestionably that got by considering number as made up of infinitesimal elements, and a differential or “infinitesimal” as being the value of the difference between a number at one stage of its growth and as another *very* near it. Every finite number being—in the view of the C. as first conceived by Leibnitz—composed of an infinite number of these infinitesimal elements, certain axioms at once present themselves regarding infinitesimals; as, for instance, “that a finite number of them has no value at

all when added to a finite quantity." Many other such axioms readily follow, from which, on this view, the whole theory of the infinitesimal C. may be constructed. But there are logical objections to this mode of forming the theory of the transcendental analysis, and of three views that have been propounded, that now universally accepted as the most logical, and as being capable of the easiest application, is that founded on the method of limits, already referred to as the invention of Newton. The meaning of a differential on this view will now be explained.

It is clear that the C. can be applied only where numbers may have the continuous character—i.e., where they are or may be conceived as being variable. If two unknown quantities are connected by a single equation only, we clearly have the condition satisfied, as where y and x are connected by the equation

$$(1) \quad y = F(x),$$

where F is a sign denoting some function of x , as $\tan x$, $\cos x$, x^2 , etc. This equality may be satisfied by innumerable values of y and x . One question which the C. solves is, how does y vary when x varies? To solve it, and, at the same time, show how the doctrine of limits affects the definition of a differential, suppose x , y , and $x + Dx$, $y + Dy$, to be two pairs of values of the variables which satisfy the above equation; then

$$(2) \quad y = F(x), \text{ and } (3) \quad y + Dy = F(x + Dx).$$

From (2) and (3) we have, by subtraction,

$$(4) \quad Dy = F(x + Dx) - F(x);$$

whence we have the ratio

$$\frac{Dy}{Dx} = \frac{F(x + Dx) - F(x)}{Dx}.$$

This ratio will generally change in value as Dx and Dy diminish, till, as they both vanish, which they must do simultaneously, it assumes the form $\frac{0}{0}$. Taking this form,

it ceases to have a determinate actual value, and it is necessary to resort to the method of limits, to ascertain the value to which it was approaching, as Dx and Dy approached zero. Let, then, dx and dy be any quantities whose ratio is equal to the limiting ratio of the increments Dx , Dy , so that

$$\frac{dy}{dx} = \lim \frac{Dy}{Dx}$$

as Dx and Dy approach zero. Then dx and dy are the differentials of x and y . It may be observed that where x and y are connected as above, they cannot vary independently of one another. In the case assumed, x has been taken as what is called the *independent* variable, the question being, how does y vary when x varies. If y were made the independent variable, it would be necessary to solve the equation $y = F(x)$, if possible, so as to express x in terms of y . The result would be an equation $x = \phi(y)$. This being

obtained, we should find $\frac{dx}{dy} = \lim \frac{Dx}{Dy}$ as before. It will be seen that on this view differentials are defined merely by their ratio to one another. Their actual magnitude is perfectly arbitrary. This, however, does not render an equation involving differentials indeterminate, since their relative magnitude is definite, and since, from the nature of the definition, a differential cannot appear on one side of an equation without another connected with it appearing on the other.

The idea of a differential being once comprehended, the reader will be able to understand, in a general way, the main divisions of the C., which we shall now briefly delineate. So much is clear from what has been stated, that there must be two main divisions—one by which, the primary quantities being known, we may determine their differentials; and another by which, knowing the differentials, we may detect the primary quantities. These divisions constitute the differential C. and integral C. respectively.

1. THE DIFFERENTIAL CALCULUS.—Recurring to the formula already given we know

$$\frac{dy}{dx} = \lim \frac{Dy}{Dx} = \lim \frac{F(x + Dx) - F(x)}{Dx}.$$

It is clear that, in the general case, $\frac{F(x + Dx) - F(x)}{Dx}$ at the limit will still be some

function of x . Calling it $F'(x)$, we have generally $\frac{dy}{dx} = F'(x)$. $F'(x)$ is called the first differential coefficient of y or $F(x)$. Being a function of x , it may be again differentiated. The result is written

$$\frac{d^2y}{dx^2} = F''(x),$$

$F''(x)$ being the second differential coefficient of y or $F(x)$; and again $F'''(x)$ may be a function of x , and so capable of differentiation. Now it is the object of the differential

C. to show how to obtain the various differentials of those few simple functions of quantity which are recognized in analysis, whether they are presented singly or in any form of combination. Such functions are the sum, difference, product, and quotient of variables, and their powers and roots; exponentials, logarithms; and direct and inverse circular functions. The C. so far is complete as we can differentiate any of those functions or any combination of them—whether the functions be explicit or implicit; and with equal ease we may differentiate them a second or any number of times. This C. is capable of many interesting applications as to problems of maxima and minima, the tracing of curves, etc., which cannot here be particularly noticed.

2. THE INTEGRAL CALCULUS deals with the inverse of the former problem. The former was: Given $F(x)$, to find $F'(x)$, $F''(x)$, and so on. The present is in the simplest case—viz., that of an explicit function: Given $\frac{dy}{dx} = F'(x)$, to find $F(x)$. The methods

of the integral C., instead of being general, are little better than artifices suited to particular cases; no popular view can be given of these. In many cases, integration is quite impossible. The explanation of *integration by parts*, by *approximation*, *definite integrals*, and *singular solutions*, is far beyond the scope of the present work. The reader is referred to any of the numerous text-books on the subject. The integral C. has applications in almost every branch of mathematical and physical science. It is specially of use in determining the lengths of curved lines, the areas of curved surfaces, and the solid contents of regular solids of whatever form. The whole of the lunar and planetary theories may be described as an application of the integral C., especially of that branch of it which deals with the integration of differential equations. It is applied, too, in hydrostatics and hydrodynamics, and in the sciences of light, sound, and heat. In short, it is an instrument without which most of the leading triumphs in physical science could never have been achieved.

CALCULUS OF VARIATIONS.—The foundation of this C. is a method of differentiation, but of quite a peculiar kind. As above explained, the object of the differential C. is to determine the form which a function, such as $F(x)$, will assume if x receive an indefinitely small increment, such as Dx . In the C. of variations, the object is to ascertain and lay down the laws of the changes supervening on a slight alteration of the *form of the function*, or should $F(x)$ become $F'(x)$. This C. commands with ease a class of problems called problems of isoperimeters, which were formerly insoluble. It has also power over mechanical problems, and many departments of high physics cannot be touched without its aid. Mr. Airy and Prof. Jellet have both written works on the subject, which may be consulted.

CALCULUS OF FINITE DIFFERENCES, CALCULUS OF FUNCTIONS.—For brief notices of these growths from the original transcendental analysis, see the articles under the headings DIFFERENCE and FUNCTIONS.

CALCUTTA (*Kali Ghatta*, the ghaut or landing-place of the goddess Kali), the capital of the province of Bengal, and metropolis of British India, is situated on the left bank of the river Hoogly, an arm of the Ganges, in $22^{\circ} 35'$ n. lat., and $88^{\circ} 27'$ e. long., about 100 m. from the sea by the river. C. was founded by governor Charnock in the year 1686, by the removal hither of the factories of the East India company. In 1700, three villages surrounding the factories having been conferred upon the company by the emperor of Delhi, in recognition of a present made to Azim, a son of Aurungzebe, they were forthwith fortified, and received the name of fort William, in honor of the reigning king; but the place was subsequently termed Calcutta, the name of one of the villages. In 1707, C. had acquired some importance as a town, and was made the seat of a presidency. In 1756, however, a great misfortune befell the rising town; it was unexpectedly attacked by Surajah Dowlah, the nawaub of Bengal, and being abandoned by a number of those whose duty it was to defend the place, it was compelled to yield after undergoing a two days' siege. Only 146 men, however, fell into the enemy's hands; but these were treated with heartless cruelty. Cast at night into a confined cell, about 20 ft. square—the notorious "Black Hole" (q. v.)—they endured the most unheard-of sufferings, and in the morning it was found that only 23 out of 146 had survived the horrors of that night. The city remained in the hands of the enemy until eight months afterwards, when Clive arrived in the country from England. In conjunction with admiral Watson, Clive succeeded in recapturing the town, and afterwards concluded a peace with the nawaub. Soon after this, and subsequent to the important victory of Plassey, the possessions of the East India company were greatly extended by means of grants made by the emperor of Delhi, and C. once more resumed its career of progress, and advanced rapidly in prosperity. In 1852, C. was erected into a municipality, the proprietors paying assessments, and erecting commissioners to apply the proceeds of these assessments in cleansing, improving, and embellishing the town. In 1837, the population of the town proper amounted to 229,700; it had increased by 1881 to 447,601; in 1891 it was 861,764, with suburbs (excluding Howrah, which had 116,606). Besides these, thousands of the three and a half millions who sleep at night in the surrounding districts of Hoogly and the 24 pergunnahs, flock during the day to C., on foot, by boat, or by railway, to their daily toil. The inhabitants are mostly Hindus; but the Mohammedans, in 1891, were nearly half as numerous as the Hindus. In 1891 the Christians numbered only about

29,000. There is a considerable number of Europeans and of Eurasians (having white fathers and native mothers), with some Armenians, Greeks, Jews, Parsees, and negroes. The port extends for about 10 m. along the river, and is somewhat less than 2 m. in breadth at its broadest part, the area being about 8 sq. m., and comprised for the most part between the river and the circular road, a spacious roadway which marks the landward boundary of the city proper. Beyond this road there lie extensive suburbs, the chief of which are Chitpore on the n., Nunden Baugh, Bahar-Simleah, Sealdah, Entally, and Ballygunge on the e., and Bhowaneepore, Allipore, and Kidderpore on the south. The villages of Sulkeah, Howrah, and Seebpoor are situated on the opposite side of the river, and contain the salt-golahs or warehouses of the government, extensive manufactories, dockyards, and ship-building establishments. The appearance of the city as it is approached by the river is very striking; on the left are the botanical gardens, destroyed by the cyclones of 1867 and 1870, but since replanted, and the bishop's college, a handsome Gothic edifice, erected by the society for the propagation of the gospel in foreign parts; on the right is the suburb of Garden Reach, with its handsome country-seats and beautiful gardens; further on are the government dockyards and the arsenal; beyond these is the Maidan esplanade, which has been termed the Hyde park of India, being the favorite place of resort of the *élite* of C. for their evening drive. Here, near the river, lies fort William, the largest fortress in India, having been constructed at a cost of £2,000,000, and occupying, with the outworks, an area of about half a mile in diameter. It is garrisoned by European and native soldiers, mounts 619 guns, and its armory contains 80,000 stands of small-arms. Facing the esplanade, among other fine buildings, is the government house, a magnificent palace erected by the marquis of Wellesley. Beyond this, extending northwards along the river bank, is the Strand, 2 m. in length, and 40 ft. above low water, with various ghauts or landing-places. It is adorned by many fine buildings, including the custom-house, the new mint, and other government offices, and the appearance given by these and other edifices has gained for C. the appellation of "city of palaces." Among its other places of interest, mention may be made of the Sudder Dewanee Adawlut, the principal court of justice; the town-hall, a fine building; the Bengal club, writers' buildings, bank of Bengal, Jesuits' college, medical college, university, the Indian and the Economic museums, theatre, besides various churches, mosques, Hindu temples, and pagodas and numerous bazars. There are a number of monuments throughout the city, the most noticeable being those erected to the marquis of Wellesley and sir David Ochterlony. Although the European quarter of the town is distinguished for its fine public buildings and commodious dwelling-houses, the quarters occupied by the natives present a very different appearance, their houses being in most instances built of mud, or bamboo and mats, and the streets narrow and unpaved. Considerable improvements have, however, been effected of late; new and wider streets have been opened through crowded quarters; brick houses are fast replacing the huts, and an extensive system of drainage has been carried out, to the no small advantage of the inhabitants. The cyclone of Nov., 1867, destroyed 30,000 native houses, and that of June, 1870, was likewise very destructive.

The water supply of C. has been very much improved. Formerly the water was kept in large tanks, interspersed throughout the city, whence it was borne by water-carriers or *bahisties* in large leather bags. Since the year 1865, however, a supply of excellent water has been obtained from the Hoogly, about 15 m. above C., where it is filtered and sent down by pipes in the usual way. The result of this and of a system of underground drainage with an outlet in the Salt Lake, has been a marked improvement in the health of the city. Gas and electric lights have now taken the place of the oil-lamps which were formerly in general use for lighting the streets at night. Street cars have been introduced and many miles of line are in use. A canal girds a part of the city beyond the circular road.

The communications of C. afford great facilities for its extensive commerce. There are several lines of railway connecting it directly with Khulna in the delta; with Goalanda, an important centre of steamship traffic on the Brahmaputra; with Darjiling in the Himalayas, and with the two seaports, Port Diamond and Port Canning. The lines to northwest India and to Bombay start from Howrah. C. is also connected by electric telegraph with the principal towns of India, and can communicate with England by several lines. Uninterrupted communication is kept up with Great Britain by numerous and well-appointed steamers and sailing-vessels. This intercourse has been greatly facilitated by the opening of the Suez canal. The river adjacent to the city varies in breadth from a quarter of a mile to nearly a mile. There are dry docks and wet docks. The city has water communication in three directions: to the east by various rivers leading to the Brahmaputra; to the north by the Hoogly and the Nadiya rivers leading to the Ganges, but navigation is here confined to the broad boats drawing from two to three feet of water; to the west by the Midnapur canal. The port has excellent anchorage, and is the lowest of several seaports on the Hoogly, which is navigable by seagoing vessels.

The growth of scientific and literary societies, here and elsewhere in India among the native communities, indicates a degree of progress and intellectual activity very hopeful for the future of India. The principal of these in C. are the Bengal Asiatic society, founded in 1784 by sir W. Jones, possessing a fine library, and a valuable and extensive museum; the Bethune society, for the promotion of intercourse between European and native gentlemen; the Dalhousie institute, for the literary and social improve-

ment of all classes of the community; the Bengal social science association, and others. The university of C. was founded in 1857, on the same basis as the London university, and exercises functions over Bengal, the North-west Provinces, Oude, and the Central Provinces. Colleges have been instituted to prepare intending students. In 1895, 2293 candidates for admission to the university of C. passed the required examinations. Other educational institutions are numerous in C. There is an engineering college and four government colleges. The principal places for religious instruction are Bishop's college, intended chiefly for the education of missionaries and teachers, and the institutions of the established and free churches of Scotland for the same purpose, all which are ably conducted.

C. may be regarded as the great commercial center of Asia. One third of the whole trade of India is done here. The exports are jute, opium, cotton, rice, sugar, indigo, coffee, tea, saltpetre, linseed, shellac, buffalo horns, hides, castor-oil, cutch, gunny bags, etc. As a central depot for the richest parts of India, C. has an extensive inland trade. The principal industries are sugar-refining, cotton manufacturing, flour, saw, and oil mills, and shipbuilding docks. Several newspapers are published. There are a few banks and numerous insurance and other companies, with a chamber of commerce. Living is comparatively cheap, and most of the luxuries of life, as well as its necessities, are to be had in the unpretentious shops of C. as readily as in most European towns. The annual fall of rain averages 64 in.; the temperature in the shade ranges in July from 78° to 87°, and in Dec. from 60° to 79°.

C. is the headquarters of the governor-general of India, and the seat of the government, the supreme courts of justice, and of the court of appeal for the province of Bengal.

CALDANI, LEOPOLDO MARCO ANTONIO, 1725-1813; an anatomist and physician, b. at Bologna, assistant to Morgagni, the celebrated anatomist of Padua, after whose death C. was chosen his successor in the professorship. At the age of 76 he published a valuable series of anatomical plates. He published also *Elements of Pathology and Physiology*.

CALDAS, or **CALDETAS** (Lat. *calidus*, hot), the Spanish for warm springs (*aguas*, waters, being understood), which are very abundant in the Peninsula, where a great number of places have received their names from the presence of these mineral waters; such as C. de Malavella, C. de Estrac, and C. de Mombuy, in Catalonia; C. de Reyes, C. de Cuntis, and C. de Tuy, in Galicia; C. de Taipas, C. de Faveios, C. de Rainhas, in Portugal. The name is common in the topography of South America, as well.

CALDECOTT, RANDOLPH, English artist, was born at Chester in 1846 and died at St. Augustine, Fla., where he had gone for his health, in 1886. He was self-taught, and while a bank-clerk contributed sketches to the London illustrated papers, which were so highly praised that he removed from Manchester to the metropolis to make art his sole calling. In depicting country life, and animals, he rivaled Leech in humor and draughtsmanship. Among books illustrated by him were *Caldecott's Picture-books*; Washington Irving's *Old Christmas* (1875) and *Bracebridge Hall* (1877); and Mrs. Ewing's *Daddy Darwin's Dovecote and Jackanapes* (1884). See Blackburn's *Randolph Caldecott: a Personal Memoir, etc.* (1886).

CALDER, Sir ROBERT, 1745-1818; a Scotch baron of an ancient family, second son of sir Thomas Calder of Muirton. He served long and honorably in the British navy, and as captain of the fleet took part in the battle off Cape St. Vincent in 1797, for which he received a baronetcy and the thanks of parliament. He was a rear-admiral in active service during the expected invasion of England by Napoleon, received both praise and blame, and was tried by court-martial. He was acquitted of disaffection and cowardice, but reprimanded for not having done more to renew an indecisive engagement. Three years before he died he was restored to command.

CALDERON, DON PEDRO, whose full name was DON PEDRO CALDERON DE LA BARCA HENAO Y RIAÑO, was b. in Madrid, 1600, and educated in the Jesuits' college there. Afterwards, at Salamanca, he studied chiefly history, philosophy, and law. His poetical genius was precocious. Before he was 14 years old, he had written a drama, *El Carro del Cielo* (The Celestial Chariot). In early life he gained, by his poetry, and also by his fertile invention of decorations, etc., for festive occasions, the patronage of several distinguished persons, and, on leaving Salamanca, 1619, was well received by the courtiers at Madrid. Love of military adventure induced him to enter the army, 1625; and, after serving with distinction in Milan and the Netherlands, he was recalled to the court of Philip IV., a prince fond of theatrical amusements, by whom he was employed to superintend various court amusements, and especially to invent dramas for the royal theater. In the following year C. was made knight of the order of San Jago, and took part in the campaign in Catalonia. Peace brought him back to poetry. The king gave him a pension, contrived to let him cultivate uninterruptedly his fertile dramatic genius, and spared no cost in securing for his plays a splendid initiation on the stage. In 1651, C. received from the head of the order of San Jago permission to enter the church, and, in 1653, was appointed to the chaplaincy of the archepiscopal church of Toledo; but, as this post removed him too far from the court, he was appointed chaplain in the royal chapel at Madrid, 1663, and received, with other favors, a pension charged on the revenue of Sicily. In the same year he was appointed a priest in the brotherhood of San Pedro, and shortly before his death, was elected by his brethren as their *caplan mayor*.

He died May 25, 1681, leaving his considerable property to the fraternity of San Pedro, by whom a splendid monument to his memory was raised in the church of San Salvador at Madrid. Fame and pecuniary prosperity had accompanied his career. The chief cities of Spain—such as Toledo, Seville, and Granada—had paid him, from time to time, large sums of money for writing their *Autos Sacramentales*, or *Corpus Christi* pieces. In these compositions, C. excelled all his predecessors, and esteemed them more highly than all his other works, though in many respects the latter display the author's genius quite as remarkably.

Spain numbers C. among its greatest poets, and criticism must allow that many of the defects in his works are to be ascribed to circumstances, and the times in which he lived, rather than to the native tendencies of his genius. He is characterized by brilliancy of fancy, elegance of versification, and a richness of detail, which from its very abundance often becomes tedious. His collected dramatic works—including many pieces of intrigue, heroic comedies, and historical plays, of which some deserve the title of tragedy—amount to 128. Among his romantic tragedies, the *Constant Prince* (*El Principe Constante*) holds the first rank. Besides these, he wrote 95 *Autos Sacramentales*; 200 *Loas* (preludes); and 100 *Saynetes* (divertissements). His last play, *Hado y Divisa*, was written in his 80th year. His shorter poems have perished; but his dramas have held their place on the stage better than those of Lope de Vega himself. The most complete edition of his dramas appeared at Madrid (9 vols., 1683–89); another was published by Apuntes (10 vols., Madrid, 1760–63). Goethe and Schlegel have made him popular in Germany, but in Britain he is not well known, and in France not cared for.

CALDERON, DON SERAFIN ESTEBANEZ, a Spanish poet and novelist, was b. at Malaga in 1801, studied law at the university of Granada, and in 1822 became professor of poetry and rhetoric there. A volume of poems which he published shortly after procured for him some distinction. Subsequently, he became an advocate in his native city, but still continued faithful to the muses. In 1830 he went to Madrid, where he published anonymously his *Poesias del Solitario* (1833). He also wrote several articles on Andalusian manners for the *Cartas Españolas*, the only literary journal at that period in Spain. In 1836, he was appointed civil governor of Logroño, but an accident obliged him to return to Madrid, where he devoted himself to collecting MSS. of the old national literature, to be the basis of a great critical edition of the *Cancioneros* and *Romanceros*. C. wrote likewise a fine novel, *Cristianos y Moriscos*. To the literature of the Spanish Moors he paid great attention. His *Escenas Andaluces* (1847) are a series of lively sketches of Andalusian life. At his death in Feb., 1867, he left behind him a work on the *Expediciones y Aventuras de los Españoles en Africa*. The Spanish government purchased his very valuable library.

CALDERWOOD, DAVID, an eminent Scottish divine and ecclesiastical historian, descended of a good family, was b. in 1575, and about 1604 was settled as Presbyterian minister of Crailing, Roxburghshire. Opposed to the designs of James VI. for the establishment of Episcopacy in Scotland, on that monarch's visit to his native country in 1617, he and other ministers signed a protest against a bill, then before the Scots parliament, for granting the power of framing new laws for the church to an ecclesiastical council appointed by the king, and in consequence he was summoned before the high commission of St. Andrews. Refusing to submit, he was committed to prison for contumacy, and then banished the kingdom. He retired to Holland, and in 1623 published there his celebrated controversial work, entitled *Altare Damascenum*, etc., in which he rigorously examined the origin and authority of Episcopacy. In 1622, a pretended recantation of his protest was published at London by a venal writer, Patrick Scott. While on the continent, C. was known by the quaint appellation of Edwardus Dido-clavius, being an anagram on his name Latinized. After king James's death in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the reformation there to the death of James VI. In 1638, he became minister of Pencaitland, near Edinburgh; and in 1643 was appointed one of the committee for drawing up the *Directory for Public Worship in Scotland*. He died at Jedburgh in 1650. From the original MS. of his *History of the Kirk of Scotland*, preserved in the British museum, an edition was printed for the Wodrow society, in 8 vols., 8vo (Edin. 1842–45), edited by the Rev. Thomas Thomson.

CALDIE'RO (ancient *Caldarium*), a decayed town of n. Italy, about nine m. e. of Verona. Its thermal springs were in repute as early as the 1st c. of the Christian era, and continued to enjoy popularity until the commencement of the 16th c., after which they gradually became neglected, and are now little visited. The Austrians repulsed the French here in 1796.

CALDWELL, a co. in w. Kentucky; 315 sq.m.; pop. '90, 13,186, incl. colored; generally level, and good pasture land. Iron and coal are found. Chief productions, corn, tobacco, wool, etc. The Illinois Central and the Ohio Valley railroads traverse the county. Co. seat, Princeton.

CALDWELL, a parish in Louisiana, on the Washita river; 548 sq. m.; pop. '90, 5814, incl. colored. Surface hilly, producing corn, cotton, etc. Chief town, Columbia.

CALDWELL, a co. in n.w. Missouri, on the Hamilton and Kingston railroad; 430 sq.m.; pop. '70, 11,390—284 colored; in '90, 15,152. Products, corn, wheat, oats, butter, wool, etc. Surface level, and soil rich. Co. seat, Kingston.

CALDWELL, a co. in n.w. North Carolina, on Catawba river and the Chester and Lenoir railroad; 460 sq. m.; pop. '90, 12,298, incl. colored. Surface rough and partly mountainous, including a portion of the Blue Ridge. Productions, corn, wheat, oats, and tobacco. Co. seat, Lenoir.

CALDWELL, a co. in s.e. Texas, e. of the San Marcos river; 500 sq.m.; pop. '70, 6572—2531 colored; in '90, 15,769. Main business agriculture and stock-raising; an undulating surface, well wooded and fertile. Co. seat, Lockhart, near which are about 20 springs of some celebrity.

CALDWELL, CHARLES, 1772-1853; a native of N. C., celebrated as a physician, and writer on medical subjects. He published Blumenbach's *Elements of Physiology* translated from the Latin, edited the *Port Folio*, edited Cullen's *Practice of Physic*, published the *Life and Campaigns of General Greene*; was professor of medicine in Transylvania university; made a tour in Europe; established medical institutions in Louisville; wrote *Memoirs of the Rev. Dr. Horace Holley*, and left his own memoirs ready for publication after his death. See his *Autobiography* (Philadelphia, 1855).

CALDWELL, CHARLES HENRY BROMEDGE, 1823-77; b. Hingham, Mass.; naval officer; entered the U. S. navy, 1838; defeated a tribe of Fiji island cannibals, 1858; took part in the bombardment of Forts Jackson and St. Philip, 1862; commanded the mortar flotilla in the operations at Port Hudson, 1863; became chief of staff of the North Atlantic squadron, 1870; promoted commander, 1874.

CALDWELL, JAMES, 1734-81; a native of Va.; graduated at the college of New Jersey; became pastor of the Presbyterian church in Elizabethtown. He was a zealous patriot during the revolution, and became obnoxious to the Tories of the region, who, in 1780, burned his house and church. Soon afterwards a British force from Staten Island fell upon the village of Connecticut Farms, where C.'s wife and children were temporarily resident, and the wife was killed by a shot while praying with her children. It is of C. that the story is told of his distributing hymn-books to the soldiers short of wadding, with the exhortation "Now, boys, put Watts into them." C. was shot and killed by a patriot sentinel at Elizabethtown Point during a dispute about a package that the soldier declared it his duty to examine. The soldier was tried by the civil authorities for murder, convicted, and executed. A fine monument to "The Soldier Parson" was dedicated at Elizabethtown on the 64th anniversary of his death.

CALDWELL, JOSEPH, D.D.; 1773-1835; a native of N. C.; graduated at the college of New Jersey, and a tutor there from 1791-96; then chosen professor of mathematics in the North Carolina university, and in 1804 was made president and professor of moral philosophy. He wrote a *Treatise on Geometry* and letters on internal improvements.

CALDWELL, MERRITT, 1806-48; b. Hebron, Me.; graduated at Bowdoin college, 1828; professor of mathematics and vice-president of Dickinson college, 1834-7, and of metaphysics and English literature from 1837 till his death; author of *Manual of Elocution* (1846), *Philosophy of Christian Perfection* (1847), etc.

CALDWELL, SAMUEL LUNT, D.D., b. Mass., 1820; graduated at Waterville coll. (now Colby univ.) and at Newton theol. sem.; pastor of a Baptist church at Bangor, Me., and at Providence, R. I.; held a professorship in the Newton seminary; and in 1878 was elected to succeed John H. Raymond, LL.D., as pres. of Vassar coll., resigning 1885. He d. in 1889.

CALEDONIA, a kind of poetical name applied to Scotland, being a resumption of that given by the Romans to the country n. of the wall of Antoninus, which ran between the firths of Forth and Clyde. Among the chief tribes of this region were the Caledonii, whence the whole country has been called Caledonia. Tacitus speaks of the Caledonians as having red hair, large limbs; being naked and barefooted; living in tents, without cities; supporting themselves by pasturing cattle, by the chase, and by certain ferries; addicted to predatory warfare; and fighting in chariots with shields, short spears, and daggers. They are supposed to have been of Gaelic or Celtic origin, and to have painted their bodies, whence the name Picti or Picts, by which, according to many writers, they were afterwards known. Agricola was the first Roman gen. to come in contact with the Caledonians. In 84 A.D. he defeated them, now united to repel a common enemy, under their chief Galgacus, at the Mons Grampius (or Graupius), the site of which has not been determined. The Romans overran the n.e. of Scotland as far as the Moray firth, and formed many encampments (of which remains still exist), but they never reduced the country to a Roman province. Roman coins and military relics have been found in connection with these camps. The name of Caledonii disappears about the beginning of the 4th c., when the inhabitants of Scotland begin to be spoken of as Scots and Picts (q.v.). See SCOTLAND.

CALEDONIA, a co. in n.e. Vermont, on the New Hampshire border, intersected by the Boston and Maine and the St. Johnsbury and Lake Champlain railroads; 648 sq.m.; pop. '90, 23,436. It is in an agricultural region, with abundant water-power, and has quarries of granite and limestone, and sulphur springs. Co. seat, St. Johnsbury.

CALEDONIAN CANAL, a chain of natural lakes united by artificial canals, running across the n. of Scotland in a straight line from n.e. to s.w., from the North sea

to the Atlantic, through Glenmore, or the Great Glen of Albin, in Inverness-shire, and touching Argyleshire at the s. end. The sea and fresh water lochs in this line are Beaully, Ness, Oich, Lochy, Eil, and Linnhe. The canal was formed to avoid the dangerous and tedious navigation of ships, especially coasting vessels, round by the Pentland firth, cape Wrath, and the Hebrides; the distance between Kinnaird's head and the sound of Mull by this route being 500 m., but by the canal only 250, with an average saving of $9\frac{1}{2}$ days for sailing vessels. The C. C. begins in the Beaully firth, near Inverness, whence a cut of 7 m. joins loch Ness, which is 24 by $1\frac{1}{2}$ mile. A cut of 6 m. joins loch Ness and loch Oich, which is $3\frac{1}{2}$ by $\frac{1}{2}$ mile. Another cut of 2 m. joins loch Oich and loch Lochy, which is 10 by 1 m.; and a fourth cut of 8 m. joins loch Eil at the village of Corpach, 2 m. n. of fort William. This ship-communication is 604 m. long, 374 m. being through natural lochs or lakes, and 23 m. by artificial cuts. Each cut is 120 ft. broad at surface, and 50 at bottom, and 17 deep. The highest part is loch Oich, which is 94 ft. above the sea. There are in all 28 locks, each 170 to 180 ft. long, and 40 wide, with a rise or lift of water of 8 feet. Eight of the locks, called Neptune's staircase, occur in succession near the w. end of the canal. Some large mountain streams between lochs Eil and Lochy are conducted in huge culverts under the canal; and by a new cut, the Lochy water is turned into the Spean. The practicability of this great work was first shown by a survey under government in 1773 by the celebrated James Watt; but it was not till 1803 that it was begun under Mr. Telford. The whole line was opened for ships in 1823. After three years of repair, it was reopened in 1847. Ships of 500 to 600 tons, fully laden, can pass through the canal.

CALEDONIA (NEW). See **NEW CALEDONIA**.

CALEDONIA SPRINGS, in Prescott co., province of Ontario, 40 m. from Montreal. They are strongly alkaline, with additions of bromine and iodine, and are much frequented by persons afflicted with scrofulous, cutaneous, and rheumatic disease.

CALEF, or **CALFE**, **ROBERT**, b. about 1678; d. 1719; a Boston clothier, who at the age of 22 (1700) pub. in London *More Wonders of the Invisible World*, a slanderous compilation, aimed chiefly at Cotton Mather's work of similar title. He was himself a believer in witchcraft, and is said to have been unscrupulous. The book was publicly burned at Cambridge by order of Increase Mather, and C. was prosecuted by Cotton Mather.

CAL'EMBOURG, or **CAL'EMBOUR**, the French name for a pun (q. v.).

CALENDAR (from *Calends*, q. v.), the mode of adjusting the months and other divisions of the civil year to the natural or solar year. The necessity of some division and measurement of time must have been early felt. The phases or changes of the moon supplied a natural and very obvious mode of dividing and reckoning time, and hence the division into months (q. v.—see also **WEEK**) of 29 or 30 days was, perhaps, the earliest and most universal. But it would soon be observed that, for many purposes, the changes of the seasons were more serviceable as marks of division; and thus arose the division into years (q. v.), determined by the motions of the sun. It was soon, however, discovered that the year, or larger division, did not contain an exact number of the smaller divisions or months, and that an accommodation was necessary; and various not very dissimilar expedients were employed for correcting the error that arose. The ancient Egyptians had a year determined by the changes of the seasons, without reference to the changes of the moon, and containing 365 days, divided into twelve months of 30 days each, with five supplementary days at the end of the year. The Jewish year consisted, in the earliest periods, as it still does, of twelve lunar months, a thirteenth being from time to time introduced, to accommodate it to the sun and seasons; this was also the case with the ancient Syrians, Macedonians, etc. The Jewish months have alternately 29 and 30 days; and in a cycle of 19 years there are seven years having the intercalary month, some of these years having also one, and some two days more than others have, so that the length of the year varies from 353 to 385 days.—The Greeks, in the most ancient periods, reckoned according to real lunar months, twelve making a year; and about 594 B. C., Solon introduced in Athens the mode of reckoning alternately 30 and 29 days to the month, accommodating this civil year of 354 days to the solar year, by occasional introduction of an intercalary month. A change was afterwards made, by which three times in eight years a month of 30 days was intercalated, making the average length of the year $365\frac{1}{4}$ days. See **METONIC CYCLE**.

The Romans are said to have had originally a year of 10 months; but in the times of their kings, they adopted a lunar year of 355 days, divided into 12 months, with an occasional intercalary month. Through the ignorance of the priests, who had the charge of this matter, the utmost confusion gradually arose, which Julius Cæsar remedied, 46 B. C., by the introduction of the **JULIAN CALENDAR**, according to which the year has ordinarily 365 days, and every fourth year is a leap-year of 366 days—the length of the year being thus assumed as $365\frac{1}{4}$ days, while it is in reality 365 days, 5 hours, 48 minutes, and 50 seconds; or 11 minutes, 10 seconds less. Cæsar gave to the months the number of days which they still have.

So comparatively perfect was the Julian style of reckoning time, that it prevailed generally among Christian nations, and remained undisturbed till the renewed accumulation of the remaining error of eleven minutes or so had amounted, in 1582 years after the birth of Christ, to ten complete days; the vernal equinox falling on the 11th instead of the 21st of Mar., as it did at the time of the council of Nice, 325 years after the birth of Christ. This shifting of days had caused great disturbances, by unfixing the times of the celebration of Easter, and hence of all the other movable feasts. And accordingly, pope Gregory XIII., after deep study and calculation, ordained that ten days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of Oct., the 15th of Oct., 1582; and, in order that the displacement might not recur, it was further ordained that every hundredth year (1800, 1900, 2100, etc.) should not be counted a leap-year, excepting every fourth hundredth, beginning with 2000. In this way the difference between the civil and natural year will not amount to a day in 5000 years. In Spain, Portugal, and part of Italy, the pope was exactly obeyed. In France, the change took place in the same year, by calling the 10th the 20th of Dec. In the Low Countries, the change was from the 15th Dec. to the 25th; but it was resisted by the Protestant part of the community till the year 1700. The Catholic nations, in general, adopted the *style* ordained by their sovereign pontiff; but the Protestants were then too much inflamed against Catholicism in all its relations, to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit *eleven* instead of ten days. A bill to this effect had been brought before the parliament of England in 1585, but does not appear to have gone beyond a second reading in the house of lords. It was not till 1751, and after great inconvenience had been experienced for nearly two centuries, from the difference of the reckoning, that an act was passed (24 Geo. II., 1751) for equalizing the style in Great Britain and Ireland with that used in other countries of Europe. It was then enacted that eleven days should be omitted after the 2d of Sept., 1752, so that the ensuing day should be the 14th. A similar change was about the same time made in Sweden and Tuscany; and Russia is now the only country which adheres to the *old style*; an adherence which renders it necessary, when a letter is thence addressed to a person in another country, that the date should be given thus:—April $\frac{1}{13}$ or $\frac{\text{June } 27}{\text{July } 9}$; for it will be observed, the year 1800, not being considered by us as a leap year, has interjected another (or twelfth) day between old and new style. See CHRONOLOGY: DATE.

The C. of the French republic remains to be noticed, which was adopted in consequence of a decree of the national convention in 1793. The midnight preceding the autumnal equinox of 1792 was fixed upon as the new epoch, from which the years were to be reckoned as the year 1, the year 2, etc. The year was divided into 12 months, each of 30 days, to which new names were given, as *Vendémiaire* (vintage month), *Brumaire* (foggy month), etc.; and instead of weeks, each month was divided into periods of 10 days, called *Primidi*, *Duodi*, *Tridi*, etc. Five *complementary* days were added at the end of each year, which were the *Fête du Génie*, *Fête du Travail*, etc. By Napoleon's command, this new system was abolished, and the use of the Gregorian C. resumed on Jan. 1, 1806.

CALENDAR, FRENCH REVOLUTIONARY. The French nation, in 1792, while reforming so many other of the world's customs, undertook the task of making a new calendar, professedly upon philosophical principles. The new era began with the republic at midnight of Sept. 21, 1792, and the months, seasons, and festivals were arranged as follows:

AUTUMN.

Vendémiaire.....	Vintage month.....	22 Sept. to 21 Oct.
Brumaire.....	Fog month.....	22 Oct. to 20 Nov.
Frimaire.....	Sleet month.....	21 Nov. to 20 Dec.

WINTER.

Nivose.....	Snow month.....	21 Dec. to 19 Jan.
Pluviose.....	Rain month.....	20 Jan. to 18 Feb.
Ventose.....	Wind month.....	19 Feb. to 20 Mar.

SPRING.

Germinal.....	Sprout month.....	21 Mar. to 19 April.
Floréal.....	Flower month.....	20 April to 16 May.
Prairial.....	Pasture month.....	20 May to 18 June.

SUMMER.

Messidor.....	Harvest month.....	19 June to 18 July.
Fervidor, or Thermidor.....	Hot month.....	19 July to 17 Aug.
Fructidor.....	Fruit month.....	18 Aug. to 16 Sept.

SANSCLLOTIDES, OR FEASTS DEDICATED TO.

Les Vertus...	The Virtues.....	17 Sept.
Le Génie.....	Genius.....	18 Sept.
Le Travail.....	Labor.....	19 Sept.
L'Opinion.....	Opinion.....	20 Sept.
Les Récompenses.....	Rewards.....	21 Sept.

This calendar existed until the 10th Nivose, year of the republic XIV. (Dec. 31, 1805) when the old system was restored by Napoleon.

CALENDAR. The name given to a member of one of the numerous sects of dervishes in Mohammedan countries, and said to be derived from the name of the founder of the sect. It is familiar to readers of the *Arabian Nights*.

CALENDAR OF PRISONERS, in the practice of the criminal law in England, is the technical name given to the list of all prisoners' names in the custody of the sheriff of each county, prepared for the assizes. When the business is over, and the trials concluded, the clerk of assize makes out in writing four lists of all the prisoners, with separate columns, containing their crimes, verdicts, and sentences, leaving a blank column, in which, if the judge has reason to vary the course of the law, he writes opposite the names of the capital convicts—to be *reprieved, respited, transported*, etc. These four calendars, being first carefully compared together by the judge and the clerk of assize, are signed by them, and one is given to the sheriff, one to the jailer, and the judge and the clerk of assize respectively keep another. If the sheriff receives afterwards no special order from the judge, he executes the judgment of the law in the usual manner, agreeably to the directions of his calendar.

CALENDERING is the term applied to the process of finishing by pressure the surface of linen, cotton, and other textile fabrics, as well as paper. It is usually done by passing the fabric between cylinders pressed together with great force; hence the origin of the term, which is a corruption of *cylindering*.

The familiar domestic processes of starching and ironing afford the simplest illustrations of the object and result of calendering. The domestic mangle effects the same object as the flat iron, and is a near approach in construction to the C. engines of the manufacturer, no traversing-box of stones being used in the new patent mangles.

The cylindrical C. machine is said to have been introduced into this country by the Huguenots, driven here by persecution. The cylinders were originally of wood, but the liability to warping is a strong objection to them.

The modern calender consists of from 3 to 12 (commonly 6) cylinders or "bowls," set vertically in a strong iron frame, with driving gear, and furnished with weights suspended over a pulley to produce the required pressure. This sometimes amounts to, or even exceeds, 20 tons, including the weight of the rollers. In a 5-roller machine, the arrangement is this: The center roller is of iron or copper, made hollow for the admission of steam or a red-hot heater, the one immediately above and that directly below it are of paper; and the remaining two, one at the top and the other at the bottom, are of cast-iron. At least one of the rollers is always of paper, as it has more elasticity than metal, and is not liable to warp, like wood. It consists of sheets of brown paper or pasteboard, densely packed and compressed on an iron axis. The edges of these form the surface of the roller, which is turned and polished, an operation of some difficulty.

Before the final rolling in the C. machine, the fabric is first lightly smoothed by passing over warm cylinders. Cotton goods are starched with a starch prepared from flour, and the starch is sometimes thickened with plaster of Paris, porcelain clay, or a mixture of these, to give a fictitious appearance of stoutness, which of course vanishes when the article is washed. For ordinary C. the fabric is then simply passed between plain cylinders, which produces the desired effect by flattening the otherwise round threads. When, by means of a hot cylinder, with a pattern raised upon it, the amount of this flattening is unequal on different parts of the cloth, the beautiful effect known as "watering" is the result. *Glazing* is produced by combined rubbing and pressure; the rollers, one of which is heated, being made to move with different velocities, so that one side of the fabric is rubbed as well as pressed by the roller whose surface moves with the greater rapidity. Before the invention of these rubbing cylinders, glazing was effected by rubbing the surface of the fabric with a polished flint. In Dundee, where half a century ago it was not the custom to calender the linen at all, there are now more than 1000 hands employed in this branch of industry. Calenders are used at most paper-mills for putting a smooth finish or, it may be, a high glaze upon paper. Machines similar to the one above described, but with all the rollers of iron, and also called calenders, are used for rolling india-rubber into sheets for coats, shoes, etc.

CAL'ENDS. The Romans made a threefold division of the month into *calends, nones*, and *ides*. The C. always fell upon the 1st of the month; the nones in Mar., May, July, and Oct., on the 7th; and the ides on the 15th; and in the remaining months, the nones on the 5th, and the ides on the 13th. The C. were so named because it was an old custom of the college of priests on the first of the month to *call* (or *assemble*) the

people together to inform them of the festivals and sacred days to be observed during the month; the nones received their name from being the *ninth* day before the ides, reckoned inclusively; and the ides from an obsolete verb, signifying to divide, because they nearly halved the month. This threefold division also determined the reckoning of the days, which were not distinguished by the ordinal numbers first, second, third, etc., but as follows: Those between the C. and the nones were termed *the days before the nones*; those between the nones and the ides, *the days before the ides*; and the remainder, *the days before the C.* of the next month. Thus, the ides of Jan. happening on the 13th of that month, the next day would not be termed by a Latin writer the 14th, but *the 19th before the C. of Feb.*, reckoning inclusively, i.e., reckoning both the 14th of Jan. and the 1st of Feb., and so on to the last, which was termed *pridie calendas*.

Ad calendas Græcas, a Roman proverbial saying, practically equivalent to "never." The Roman C. were often appointed as days for payment of rent, interest, etc.; but as the Greeks had no C., a postponement of payment *ad calendas Græcas*, simply meant a refusal to pay altogether. It is said that the emperor Augustus frequently used the phrase, which afterwards became a proverb. See **CALENDAR**.

CALENTURE, a Spanish term (*calentura*) applied to a species of temporary delirium or fever occurring on board ship in hot climates, and probably due to the effect of exposure to the direct rays of the sun. The descriptions of the disease seem rather fanciful and contradictory, and the term is nearly obsolete. See *Dictionnaire des Sciences Médicales*.

CALEPI'NO, AMBROGIO, 1435-1511, an Augustine monk who devoted his life to making a polyglot dictionary. The latest edition comprises 11 languages, some of them added by Passerat and others.

CALGARY, a city in the province of Alberta, Canada, and the centre of a large stock-raising region, on the Canadian Pacific railroad, 2264 miles w. of Montreal and 838 miles w. of Winnipeg. It was incorporated in 1885, having been a Hudson's Bay post, prior to the construction of the Canadian Pacific railroad. It lies on a beautiful plateau, backed on three sides by mountains, and is nearly surrounded by Bow and Elbow rivers. It is an important distributing point for freight; ships large quantities of cattle, sheep, and horses, and has a large trade in furs and hides. There are four churches, three banks, good hotels and schools, some costly public and private buildings, waterworks, electric lights, etc. Population, 1891, 3510.

CALHOUN, a co. in n. e. Alabama, on Coosa river and the Southern and the Eastern and Western railroads; 640 sq. m.; pop. '90, 33,825, includ. colored. Surface uneven and in some parts mountainous. Productions agricultural. Marble, limestone, lead, and iron abound, and some gold has been discovered. Co. seat, Jacksonville.

CALHOUN, a co. in s. Arkansas, on the Washita and Moreau rivers; 575 sq.m.; pop. '90, 7267, includ. colored. Surface rolling or level, and soil good; productions agricultural. Co. seat, Hampton.

CALHOUN, a co. in w. Florida, on the gulf of Mexico, w. of Appalachicola river; 1080 sq.m.; pop. '90, 1681, includ. colored. Surface level and fertile, producing corn, tobacco, etc. Co. seat, Blountstown.

CALHOUN, a co. in s.w. Georgia; 265 sq.m.; pop. '90, 8438, includ. colored. It is level, with fertile soil, but little cultivated. Co. seat, Morgan.

CALHOUN, a co. in s.w. Illinois, between the Illinois and Mississippi rivers; 260 sq.m.; pop. '90, 7652. Near the rivers the land is low and subject to inundation; in other parts marked by high bluffs and tablelands. Productions agricultural. There are coal-fields in the w. section. Co. seat, Hardin.

CALHOUN, a co. in w. Iowa, on Coon river and the Des Moines, Northern, and Western railroad; 576 sq.m.; pop. '70, 1602; in '90, 13,107. Productions agricultural. Co. seat, Rockwell City.

CALHOUN, a co. in s.w. Michigan, on St. Joseph river and the Cincinnati, Jackson, and Mackinaw, and the Michigan Central railroads; 720 sq.m.; pop. '90, 43,501. Soil rich, surface generally level; productions agricultural. Co. seat, Marshall.

CALHOUN, a co. in n. Mississippi, on the Yallahusha river; 600 sq.m.; pop. '90, 14,688, includ. colored. Productions, corn, cotton, butter, etc. Co. seat, Pittsboro.

CALHOUN, a co. in s.e. Texas, on the Gulf of Mexico, and including Matagorda island; 500 sq.m.; pop. '90, 815, includ. colored. Surface level and soil poor, with little timber. The Southern Pacific railroad and its branches traverse the county. Co. seat, Port Lavaca.

CALHOUN, a co. in w. West Virginia, on the Little Kanawha river; 260 sq.m.; pop. '70, 2939; in '90, 8155. An agricultural region. Co. seat, Grantsville.

CALHOUN, JOHN CALDWELL, an American statesman, and seventh vice-president of the United States, descended from a Presbyterian emigrant from Ireland to Pennsylvania in 1733, was the third son of Patrick and Martha (Caldwell) Calhoun, and was born in the Abbeville district (now county) South Carolina, March 18, 1782. His early education was irregular and defective, owing chiefly to the moderate circumstances of the family, and though determined to obtain a collegiate education, he worked on the

farm until he was nineteen; then began to study under a brother-in-law, and, in 1802, entered the junior class at Yale, graduating in 1804 with high honors. After studying law, part of the time at Litchfield, Conn., he returned to his native state, where he practised without distinguishing himself; but in 1811 was elected to congress by the party favoring a war with Great Britain, and in that same year married a second cousin, Floride Calhoun, who brought him a moderate fortune, and inherited from her mother the estate of Fort Hill, now in Pickens co., which was his home after 1824. On entering Congress he was placed on the committee of foreign affairs, and supported President Madison in his recommendation, April, 1, 1812, of an embargo as preliminary to a declaration of war, and in May presented a report to the House advising an appeal to arms, following it up with a bill making a formal declaration of war. Although he supported the administration during the conflict, he warmly opposed the non-importation act, and in 1816 advised the increase of the navy, and the building of permanent roads as the best means of uniting and defending the country. In the same year, as chairman of the committee on national currency, he reported a bill for the incorporation of a national bank, and on April 6 made a vigorous speech in behalf of a protective tariff as calculated "to bind together more closely our widely-spread republic." In March, 1817, he was made secretary of war in the cabinet of President Monroe, and having previously maintained that congress could make internal improvements in the various states without express constitutional authority, he was, in 1818, requested by the House of Representatives to prepare a plan for opening and constructing roads and canals. He reorganized the war department, reduced the army, and attempted to bring General Jackson to trial for invading Florida in violation of his orders. In 1820 he supported the Missouri Compromise bill. In 1821 he was mentioned as a candidate for the presidency, but General Jackson proved more popular, and Calhoun was elected vice-president in 1824, receiving the votes of the friends of Jackson and of Adams. Joining the party in opposition to President Adams and in favor of General Jackson, he was re-elected vice-president in 1828, and as the southern states at that time were almost unanimous for free trade, he became the leader of the party advocating that measure, while Mr.—afterwards President—Van Buren headed the middle state party desirous of a protective tariff. The passage of a tariff bill in 1828 led Calhoun to prepare a paper which asserted the doctrine of the sovereignty of the states and which was issued by the legislature of South Carolina; becoming known as the "South Carolina Exposition." The lack of harmony between Calhoun and Jackson was increased when the latter learned, or thought he had learned that Calhoun had arrayed the cabinet against him during the Seminole war, and also by a little social controversy in which Calhoun supported and Jackson and Van Buren opposed an attempt on the part of ladies high in Washington society to ostracize the wife of the secretary of war. (See EATON, MARGARET L.) In 1831 the *Globe* newspaper was established in Washington to counteract the influence of the *Telegraph*, a paper devoted to Calhoun's interests, and it being evident that Jackson favored Van Buren as his successor, and that the repeal of the protective system could not be obtained through the former, Calhoun published, July 26, 1831, an address in a South Carolina newspaper in which he repeated his arguments in favor of free trade, and asserted the right of states to judge of infractions of the constitution and to nullify such laws. In 1832, Aug. 28, he addressed a letter to the governor of South Carolina in which he maintained that "there is no direct and immediate connection between the individual citizens of a state and the general government," and that "the great conservative principle" of the union is nullification. On Nov. 24, South Carolina adopted an ordinance to nullify the tariff, and Calhoun at once resigned the vice-presidency and entered the senate. He opposed the president's proclamation urging the people of South Carolina to reconsider their position, and his attempt to obtain additional legislation to enable him to enforce the collection of revenue. Clay's compromise measure of 1833, looking to the abandonment of the protective policy after 1843, was supported by him; he acted with Clay and Webster in denouncing General Jackson for removing the public deposits from the United States bank; but although co-operating with the Whigs for several years, he refused to be classed with them. Foreseeing clearly a conflict between the North and South on the slavery question, he strove in every way to arrest the anti-slavery movement. After the financial crisis of 1837, President Van Buren proposed to place the public moneys in the custody of officers especially appointed for the purpose, and the exclusive use of coin by the government. By siding with him on this question, Calhoun alienated his friends among the Whigs, and was bitterly reproached as a deserter by Clay and Webster. He supported Van Buren for re-election, and induced South Carolina to vote for him; defended President Tyler's veto of the bills for chartering a United States bank, denounced the tariff bill of 1842, and voted for the Webster-Ashburton treaty with England. He had now become allied with the democratic party, but on the expiration of his term of service, in 1843, he declined a re-election. In March, 1844, he was appointed secretary of state by President Tyler, but in 1845 was re-elected to the Senate. He was largely instrumental in securing the annexation of Texas, but in 1846 opposed the war with Mexico. In 1847 he proposed a convention of southern states to prevent northern ships and commerce from entering their ports, as a retaliation for the toleration in northern states of anti-slavery presses and societies; in 1848 denied

that the Monroe doctrine was the settled policy of the country ; declared that the inhabitants of no state or territory had the right to exclude slavery, and insisted that the south must act at once if she would save the union or save herself, and accordingly attempted to form a union of the slave-holding states, having in view the possible withdrawal of those states from the union. His last elaborate speech, which was read by another senator, March 4, 1849, reiterated the complaints about the encroachments of the federal government upon the rights of the south, and asserted that an amendment to the constitution would be necessary to restore equilibrium. This, as appears from a posthumous treatise, *On the Constitution and Government of the United States*, he would have secured by the election of two presidents, one for each section of the country, each having a veto on all acts of congress. His last public appearance was on March 13, and on March 31 he died of pulmonary disease combined with disease of the heart.

Mr. Calhoun was a concise, logical, and earnest speaker ; gifted in conversation, and fascinating in manners ; assiduous in the discharge of public duties ; irreproachable in private life, and a just and kind master to his slaves. He is described as tall and slender, with a thin and angular face, and dark, brilliant eyes. Of ten children, five sons and two daughters survived him. See *Life*, by Jenkins (1851), and by von Holst (1882) ; Benton, *Thirty Years' View*, and Calhoun's collected works (6 vols., 1853-54).

CALHOUN, SIMEON HOWARD, D.D., 1804-76; b. Boston, Mass. He graduated from Williams coll., 1829; was ordained to the ministry; went as missionary to Palestine, where he labored with distinguished success for 40 years. He was an authority on the Arabic and Turkish languages, and assisted in making the first translation of the Bible into Turkish.

CALIBRE, or **CALIBER**, is a technical name for the diameter of the bore of a fire-arm, whether a piece of ordnance or a small-arm. The ordnance from which solid shot are projected are usually denoted by the weight of each shot, as 24-pounder, 68-pounder, etc.; but mortars, and such guns as project shell or hollow shot, are more usually denoted by the C., such as 13-inch mortar, 10-inch shell-gun, etc.

CALICO-PRINTING is the production of a colored pattern on cotton cloth or calico. It appears to have been first practised at *Calicut* in India—hence the term *calico*. From the East Indies the art spread to Asia Minor and the Levant, thence to Augsburg in Bavaria; from whence, at the beginning of the 18th c., it spread to Alsace in France, to Switzerland, and ultimately to England and Scotland. The term as now employed includes all the processes followed in the formation of a colored pattern on cotton, linen, worsted, and silk goods, as also mixtures of two or more of these.

The first operation connected with the printing of cloth is the removal of the surface hairs or minute threads which communicate a fibrous down or nap to the surface of the cloth, and which, if allowed to remain, would interfere with the uniform application of the colors. The surface down is got rid of by the process of singeing, during which the cloth is drawn over a red-hot iron or copper bar or plate, or through a series of gas-jets. The process is repeated twice on the face of the cloth, being the surface to be printed on, and once on the back. In *gas singeing* the cloth is not only allowed to come in contact with the burning gas, but the flame is transmitted through the cloth, and a suction-apparatus is often placed immediately above, so as to draw the flame through more effectually. When well singed, the cloth undergoes the process of bleaching (q.v.), and is thereafter calendered. See **CALENDERING**.

There are several modes or "styles" of applying the colors to cloth :

The *madder style* is that in which a certain fixing agent or mordant is printed on the cloth, which is then introduced into the coloring matter in a dye-vat, when the mordant, having an attraction alike for the fiber of the cloth and for the coloring matter, acts the part of glue or paste, and cements the color to the cloth. Since the discovery in 1869 of a method of artificially preparing alizarin (q.v.), the chief coloring principle of madder, the artificial product has almost entirely displaced the madder root. But the process for printing alizarine is what is called a topical style. The fixing agents or mordants generally employed in the madder style are different strengths of *red liquor* (acetate of alumina), *black* or *iron liquor* (acetate of iron), and mixtures of these. These are thickened with wheat starch, potato-flour, roasted starch, or dextrine, and gum-arabic, so that the mordant may not run when it is placed on the cloth by the pattern-block or by the printing machine. After the mordant has been imprinted on the cloth, the latter is passed slowly but continuously through a chamber heated to a temperature of from 80° to 120° F., the air being moistened nearly to saturation by jets of steam. The result is, that the mordant is decomposed, the acetic acid is evolved, and the alumina or iron is left attached to the fiber of the cloth in the state of an insoluble sub-salt. As some of the mordant is still left in its original soluble condition, it is necessary to wash the cloth free from this, else, during the dyeing operation, the soluble part of the mordant would run on to those parts of the cloth not intended to be colored, and thus produce a blotted appearance. To obviate this, the cloth, having undergone the process of *drying and aging*, is then introduced into a vat containing water, through which is diffused some cow-dung, dung substitute—a preparation of bone-ash, sulphuric acid, carbonate of soda, and glue—or bran. The result of this process of *dunging* is the removal of the soluble part of the mordant, as also the starch, or thickening agent, leaving the decomposed or insoluble mordant adhering to the fiber. The terms *dung-fixing*, *substitute-fixing*, and *bran-fixing*, have reference to the employment of one or other of these agents at this stage of the operation. When

the cloth has been well washed from the dunging, it is introduced into the vat or dye beck containing the coloring matter. The whole is heated by steam-pipes, and the cloth being placed on a sparred reel kept in motion, is repeatedly wound out of the vat, and returned thereto. The result is, that wherever the mordant adhered to the cloth, the coloring matter is attached thereto, and little or no trace of color adheres to the unmordanted parts. The last operation is the *clearing or brightening*, during which the colored cloth is introduced into warm baths of water containing soda, soap, or, for the more delicate tints, bran, and is thereafter acted on by weak acid solutions. The object is to clear the colors, and at the same time to confer upon them the property of resisting the fading action of the air and sun for a much longer time. The different shades of color which can be obtained from the same madder beck or vat, with different mordants, are very numerous, and include reds, lilacs, purples, chocolates, and blacks. Thus, when a weak solution of red liquor (acetate of alumina) is employed as the mordant, a light red tint is procured; with a stronger aluminous mordant, a deep red is formed on the cloth; with a more or less dilute solution of iron liquor (acetate of iron), the cloth is colored lilac, violet, or purple; with a strong solution of iron liquor, black is obtained. Indeed, the same piece of cloth stamped in different places with the various strengths of aluminous and iron mordants, and mixtures of these, and immersed in the madder-bath, will be obtained dyed with all the shades mentioned; and in this manner many of the beautiful variegated colored dresses and handkerchiefs are prepared for market.

The *topical style* in C.-P. is the process whereby certain coloring matters which are insoluble in water, and cannot therefore be applied to cloth by the modes suggested under the madder and padding styles, are treated at once with the mordant, and the mixture by one operation transferred by block, or otherwise, directly on the surface or *top* of the cloth, and hence the term *topical*.

Padding Style.—When a mordant is applied, not to any particular part, but to the whole surface of the calico, by the padding machine, it is said to be padded. The mordant is generally either red or black liquor, or a mixture of both. The machine consists of a pair of cylinders over a trough containing the solution, through which, and between the rollers, the cloth is made to pass. It is then dried in a long-heated chamber, and the design printed upon it in an acid discharge, such as citric acid and a salt of potash. When the calico is dunged and dyed in alizarine and other solutions, a white pattern is produced on a colored ground, because the dye does not attach itself to the parts where the acid mixture has been printed. A pattern may also be printed in a stronger mordant than that used for the padded ground, so that we can have, for example, a dark purple as well as a white device on a pale purple ground. The white device may be afterwards wholly or partly filled with color, and in this way designs in numerous shades or colors are produced.

Indigo Dyeing and Printing.—The blue indigo (q. v.) of commerce is insoluble in water, but it can be changed by deoxidation into soluble white indigo, which is capable of penetrating cotton fiber; and when calico is "dipped" into white indigo and exposed to air, it becomes blue by absorption of oxygen. When a white pattern is to be produced on an indigo-blue ground, it is printed in resist paste on the calico before it is dyed. This paste varies in composition; one kind being made up with sulphate of zinc, nitrate of copper and soap, thickened with gum. On the resist being removed after dyeing, the white device appears. Clearer whites can, however, be obtained by printing a pattern in some discharging medium on the dyed cloth. Chromate of potash and oxalic acid separately applied—that is, either being printed on and the cloth then passed through the other—will effect the discharge of the blue color. Artificial indigo, which was first made in 1880, is, owing to its high price, not much employed in printing.

Chrome Yellow.—A mixture of acetate and nitrate of lead is first printed on the cloth as a mordant, and fixed by dilute sulphuric acid; or, if the nature of the pattern requires it, by other agents. The calico is then worked in a warm solution of bichromate of potash, which produces a yellow color; and if caustic soda or milk of lime be added to the solution, this is deepened into an orange.

Indigo Blue and Chrome Orange.—The production of an orange pattern on a blue ground has been a very successful style in the hands of some calico-printers. By means of resists and acids this style can be varied so as to have in the same design orange, yellow, white, and 2 shades of blue, together with green, if Prussian blue be added to the yellow.

Catechu (q. v.) is the source of numerous shades of brown, fawn, gray, and drab, which are fast, and can be combined with the colors obtained from madder. It fixes readily upon cotton fiber, but its coloring principle requires to be oxidized by such agents as lime-water, bichromate of potash, or a salt of copper.

Logwood.—In C.-P. logwood is used with iron, alumina, and chromium mordants. It is employed for black and chocolate colors.

Pigment Style.—Formerly this style was almost confined to printing with artificial ultramarine, but it has been much developed of late years. Other colors, such as vermilion, cadmium yellow, chrome yellow, Guignet's (chromium) green, ochres and umbers, are now printed as pigments on cloth. These colors are not soluble, as is the case with those used in other styles, but must be ground to fine powder and mixed with albumen before being printed. The calico is afterwards exposed in a close chamber to steam, which coagulates the albumen and fixes the pigment. Either white of egg or blood albumen is employed, and some of the colors so printed have great brilliancy.

Steam Style.—What are technically called steam colors are fixed upon cotton by the agency of steam. For these the calico is first “prepared” by a padding with stannate of soda, and souring with dilute sulphuric acid, for the purpose of depositing oxide of tin in the fiber. In this style the mordants and colors are mixed together and printed on the cloth. When, for example, alizarine is applied in this way, a mixture is made of the dye with the acetate of alumina or acetate of lime, along with some thickening body such as starch. The printed stuff is either at once steamed in a suitable chamber or piece of apparatus, or it is first exposed for some hours to the air and then steamed. Alizarine colors are not quite so beautiful when produced in this way as when dyed upon mordants by the old madder process above described; but this steam process has the great advantage of enabling them to be used in combination with pigments and other coloring matters, thickened with albumen, since the steam also fixes the latter, as explained in the last paragraph. By the old way, if these pigment colors are used in the same design with madder, they require to be put in with hand-blocks. Among the “steam colors” which have been in use for some length of time are those from Brazil-wood and other dye-woods, the yellow from Persian berries, cochineal red and Prussian blue.

The *resist style* in C.-P. is that in which certain materials are placed on the surface of cloth, to protect it from the adherence of the mordants, and, consequently, to keep that part of the cloth from being attacked by the coloring matter. These materials are termed resists, or reserves, and they are divisible into mechanical and chemical. The *mechanical resists* are such substances as fats, resins, oils, wax, and pipe-clay. The chemical resists may act on the mordant or on the color. If it be desirable to remove the mordant, and thus leave certain parts of the cloth unable to attach color, the printing of a pattern with some acid substance on the cloth will form with the mordant a soluble salt, which can be readily removed by washing, while the parts which have not been printed in acid are not dissolved away by the washing, and still retain their full power in the colorants to cause the adhesion of the color. For this purpose, where an iron or aluminous mordant has been employed, it is customary to print thereon in the requisite pattern, lemon-juice, tartaric or oxalic acid, and bisulphate of potassa, or a mixture of two or more of these, thickened with gum-arabic. Sulphate of zinc is used to resist the adherence of indigo blue.

The *discharge style* in C.-P. comprehends the employment of similar materials to those used in the resist style, but after the cloth has been colored or dyed, and for the purpose of discharging the color, or bleaching the cloth at certain parts, according to pattern. The dischargers for organic coloring matters are chlorine and chromic acid. The chlorine is employed in the form of bleaching-powder (q.v.), and the cloth already dyed is printed with a solution of tartaric acid (or other acid), thickened with pipe-clay and gum, then dried, and passed through a solution of bleaching-powder, when the decoloration occurs as already explained under BLEACHING. Chromic acid is generally employed in discharging indigo color. The cloth, already entirely blue, is soaked or padded in bichromate of potash, and then an acid discharge printed thereon; and wherever the acid comes in contact with the blue cloth containing the bichromate of potash, chromic acid is liberated and destroys the color.

Spirit Style.—In this style the made-up colors are applied topically. Such dyes as Persian berries and sapan-wood are mixed with oxymuriate of tin or other mordants, and printed on the calico. They are not steamed after printing, but simply dried at a moderate temperature, aged for a short time, and washed. The colors are bright, but not permanent. The name has arisen from the tin compounds used being called “spirits.”

Aniline Black.—This is one of the fastest colors known. One of the mixtures used to produce it is composed of chloride of aniline, sulphide of copper, and chlorate of potash, thickened with starch. More recently vanadium salts have been substituted for sulphide of copper. The calico is nearly colorless when newly printed, but it soon turns black when hung up in warm and moist air.

Other Aniline Colors.—With the exception of black, the colors from aniline (q.v.), although fairly durable on silk and wool, are fugitive upon cotton. The brilliancy of some of them, especially the purples, is great. Methylen blue, saffranine (pink), methyl green, auramine (yellow), Bismarck brown, and several other aniline colors, are a good deal used in C.-P. They are fixed by various mordants, such as tannin, or tannin with tartar emetic; or they may be printed on the cloth with albumen. Most aniline colors are steamed after they are printed.

Seats of the Industry.—The distribution of C.-P. machines throughout the world in 1882 was: England, 640; Scotland, 280; Ireland, 22; America, 500; Russia, 150; Germany, including Mulhouse (Mülhausen), 100; France, 50; Austria, 25; Switzerland, 24; Portugal, 15, and Holland, 5. See DYEING; DYE-STUFFS.

CALICUT, a seaport of the district of Malabar, which, though on the w. side of the peninsula of Hindustan, yet forms part of the presidency of Madras. In lat. $11^{\circ} 15' N.$, and long. $75^{\circ} 50' E.$, it is distant from Goa and Bombay respectively 300 and 566 miles. It was the first spot in India visited by Covilham, (1486), and so populous and powerful was it, that it twice repulsed the Portuguese, slaying their commander in 1509. It stands near the mouth of a small river of the same name, and possessed at one time a good haven. Now its anchorage is merely an open roadstead, at a distance, at least

for large vessels, of 2 or 3 m. from land. Independently of this physical disadvantage, the ravages of war and the competition of superior localities contributed to the decay of Calicut. Accordingly, in 1792, when it fell into the hands of the English, the city was little better than a ruin. Since then, it has made considerable progress, and in 1891 was found to have 66,100 inhabitants. From *C. calico* is understood to have derived its name, just as *cambric* from Cambrai, in the n.e. of France.

CALIFORNIA, a Pacific Coast state, and the 18th in order of admission; between lat. $31^{\circ} 37'$ and 37° n.; long. $109^{\circ} 3'$ and $114^{\circ} 25'$ w.; bounded on the n. by Oregon, on the e. by Nevada and Arizona, on the s. by lower California, and on the w. by the Pacific ocean; extreme length, about 750 m.; average breadth n. of Monterey, 200 m.; s. of that point, 300 m.; land area, 155,980 sq.m., or about 99,000,000 acres, of which 13,000,000 are suitable for agriculture, 15,000,000 for mining, lumbering, etc., and 10,000,000 are classed as unproductive.

HISTORY.—The name *C.* first appeared in a Spanish romance published in 1521, as that of an island lying near the equator. Between 1535 and 1549 it was applied to the peninsula of lower *C.*, then supposed to be an island, and finally was extended to an indefinite portion of the continent as far n. as the parallel of 42° ; the two divisions being ultimately called *Alta* and *Baja*: upper and lower *C.* The coast and islands in the Santa Barbara region were visited by the Spanish explorer Cabrillo, 1542, 1543, and on his death, Jan., 1543, his successor, Ferrelo, continued the exploration to about lat. $40^{\circ} 26'$. In 1579, Francis Drake sailed as far as lat. 48° ; named the country New Albion, and landed, probably under point Reyes ($38^{\circ} 30'$). In 1602, 1603, Vizcaino visited San Diego and Monterey bays; continuing up to Point Reyes. In 1769, July 16th, Franciscan monks founded a mission at San Diego, and in Oct. an overland exploring party from that place discovered the bay of San Francisco. In 1772, the Franciscans gave up to the Dominicans the missions they had founded in the peninsula, and removed to Alta *C.* Secular emigration followed, and soon Alta *C.* was divided into the provinces of San Diego, Santa Barbara, Monterey, and San Francisco; each with a civil and military ruler or *commandante*, and each with a *presidio* or fortified seat of government. Each mission had its priest *presidente*, who ruled independently of the *commandante*, and was only nominally subject to Mexico. The missions spread, almost continuously, along the coast, till in 1823, when the last and most northerly, at Sonoma, was planted, they numbered 21, and the revenues from their great ranches and olive, orange, and grape plantations became enormous. The Indians connected with them were taught agriculture and trades, and were in some instances instructed, but were held in a kind of slavery. The Spanish government, intending to turn the missions eventually into parishes, never formally acknowledged the land claims of the priests, and in 1777 began the establishment of *pueblos*, or towns; in 1813 granting those formed the right to their own councils or *ayuntamientos*. The priests' opposition to these measures, and especially to the Mexican revolution of 1822, hastened their downfall; the Indians were freed from their allegiance in 1826, and relapsed into barbarism, and in 1834 the mission lands and herds were divided.

Commerce with foreign nations was at first forbidden, but early in the present century ships from eastern ports started a trade with *C.* that became very large after 1822, and consisted in the exchange of groceries and cotton goods for hides and furs. In 1826 the first American emigrant wagon train entered *C.* In 1840, Mar. 27, Monterey was made the capital of *C.*, and in 1841, the Russians, who had maintained a trading post n. of Bodega Bay since 1812, abandoned it.

Anticipating a war with Mexico, and believing that England had designs on *C.*, the U. S. government took steps to secure the alliance, if not the annexation of the latter, promised to aid *C.* in attaining independence in case of war, and instructed the consul at Monterey to use his powerful influence to that end, while Com. Sloat, then in the Pacific, was ordered to peaceably occupy the ports of Monterey and San Francisco on the outbreak of hostilities. The plot proceeded smoothly, when Fremont, who was under instructions from Washington to co-operate with Sloat, but was misled by reports of threatened violence to the American settlers, encouraged his countrymen to rise, and they, seizing Sonoma, June 14, 1846, proclaimed a republic. On July 7 Sloat seized Monterey, and war with Mexico having been proclaimed, the U. S. flag was raised at Yerba Buena (San Francisco). Fremont's force was organized into a battalion of mounted riflemen; the main posts from Monterey northward were seized by the Americans, and on Aug. 15 *C.* was declared to be U. S. territory. Concurrent events were a large immigration both by land and water, and the establishment of the military department of *C.* under Gen. Kearney. The discovery of gold at Sutter's Mill, near Coloma, Jan. 19, 1848, gave impetus to emigration to *C.* from all parts of the globe. The great body of gold-seekers, "the argonauts," arrived early in 1849, and by the end of the year the population exceeded 100,000. Nearly all the new-comers were unmarried men in haste to get rich; hence the organization of society was neglected, or hindered by the influx of lawless foreigners. There was reckless speculation, extravagant living, and easy-going morality in many localities; but stable elements were not lacking; the mining camps had stringent laws of their own, and lynch law was resorted to in many quarters. Life and property, however, were not well secured; the people were heavily taxed without representation; and though San Francisco had been made a port of entry and the U. S. customs and rev-

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

enue laws had been extended over the country, no territorial government had been granted. In 1848 the people made several attempts to organize their own government; in 1849 succeeded, and at a convention, organized Sept. 3, framed a constitution resembling that of New York and prohibiting slavery. This was ratified Nov. 13; on Dec. 15 the state officers were inaugurated, and on Dec. 20 military rule ceased. In Jan., 1850, U. S. senators were elected, and on Sept. 9 C. entered the Union. Opposition was made by southern members of congress, mainly because another free state would be created, and with this same excuse partly, and partly because the native Californians in the s. part of the state were, as they claimed, overtaxed, and had no recognized title to their lands, a plot was formed in 1851 to detach southern C., an attempt that was repeated, on political grounds, just before the civil war broke out. In 1851 the citizens of San Francisco formed "a vigilance committee" to check the lawlessness in that city: trying, banishing and hanging when necessary, and did not surrender its power till 1856. The years 1852 and 1853 were noted for great prosperity. Commerce increased, and the output of gold in 1853 was \$65,000,000, but speculations in all kinds of property followed, with a consequent financial crisis in 1855. When the civil war broke out, C., which was thought to be contemplating secession, was exempted from furnishing troops. The union party, however, was strong, and not only contributed nearly \$1,500,000 to the federal government, but sent 5 companies of volunteers into the field. Extensive fires and floods have visited the state at different times, and some severe earthquake shocks, especially in 1872.

TOPOGRAPHY.—Two great mountain ranges extend in a n. westerly and s. easterly direction, and with their spurs occupy a large part of the surface. The coast range consists of numerous broken ridges enclosing rich and narrow valleys, such as Russian river, Napa, Salinas, and Los Angeles. This range, with an average breadth of base of 65 m., varies in height from 1000 to 6000 ft.; in places rises abruptly from the ocean; elsewhere recedes gradually, leaving room for little valleys of great fertility. Its highest peaks are Mt. Ripley, in Lake co., 7500 ft., and Mt. Downie, in Los Angeles co., 5675 ft. Among its principal divisions are the Monte Diablo range, extending s. from San Pablo bay for 150 m., and the Contra Costa range, stretching s.e. from Carquinez strait for about 50 m., and joining the main range at Mt. Hamilton, 4448 ft. high. The Sierra Nevada, or Snowy mountains, starting from Mt. San Bernadino at about lat. 34° n., join the coast range at Tehachapi, and stretching continuously along the e. part of the state for about 450 m., form part of the border, and again unite with the coast range at Mt. Shasta between 40° and 41°. Their average width is 80 m.; their average height from 4 to 15,000 ft.; the greatest elevations attained (excepting Shasta, 14,350 ft.), are between latitudes 35° and 38°. Mt. Whitney is 14,898 ft.; Mt. Tyndall, 14,886 ft.; Mt. Brewer, 13,886 ft. It is estimated that there are at least 100 peaks exceeding 10,000 ft. The w. side of these mountains slopes down into long valleys and cañons, but the e. side is abrupt and ends in a basin from 4 to 5000 ft. above the sea. Of the few available passes, that used by the Central Pacific railroad is elevated 7042 ft. The basin between these great ranges, at some early period the bed of a lake, has a length of 450 m., a breadth of 55 m., comprises about 12 per cent of the entire area of C., and contains 30,000,000 acres of arable land; about one third of it alluvial. The n. part is called the Sacramento valley; the s. the San Joaquin valley. In the n.w. corner of C. the Scott, Siskiyou, and Salmon mountains, from 6 to 8000 ft. high, hem in some small but fertile valleys. The n.e. corner is a plateau about 5000 ft. above the sea. The Mojave basin, a sterile and mountainous tract, lies along the s.e. border for 400 m., measuring 200 m. in its widest part, and elevated from 4 to 5000 ft. Joining this, in the extreme s.e. is the Colorado "desert," about 140 m. long by 70 m. wide, and from 10 to 200 ft. below sea level. The coast, fully 900 m. long, has, as its prominent capes, Mendocino, Arena, Concepcion, and St. Vincent. A few groups of rocky islands lie off the coast; the Farallones, 20 m. w. of the Golden Gate; San Miguel, Santa Rosa, and Santa Cruz, s. of port Concepcion, and still further s. San Nicolas and others. Among the many good harbors are Humboldt, Bodega, Tomales, Monterey, San Luis Obispo, Santa Barbara, Santa Monica, San Pedro, and San Diego. San Francisco bay (q. v.) is the best harbor on the Pacific. The largest and the only navigable rivers, except the Colorado, which forms the boundary with Arizona, and is navigable to Callville, 612 m. from its mouth, are the Sacramento and San Joaquin, each about 350 m. long, flowing through the valleys called after them, to unite near lat. 38° and empty through Suisun bay into the bay of San Francisco. The Sacramento receives from the Sierra Nevada the Pitt, Feather, Yuba, American, Consummes, and the Mokelumne rivers, and is navigable to Sacramento city. The San Joaquin receives from the same range the Calaveras, Stanislaus, Tuolumne, Merced, Chowchilla, and Fresno, and is navigable for light boats nearly to the Sierras. The Tuolumne falls 4650 ft. in 22 m. The Kings, Tule, and White rivers empty into Tule lake; the Kern into Kern lake. The chief rivers flowing from the coast range into the Pacific n. of San Francisco are Smiths, Klamath (about 225 m. long), Mad, Elk, Eel, and Russian—all permanent streams. Among those s. of San Francisco are the San Lorenzo, Pajaro, Salinas, Santa Inez, Santa Clara, Los Angeles, San Gabriel, and San Diego—all coursing through rich valleys, and permanent to within 10 or 15 m. from their mouths. The largest lake, Tulare, in the s. part of the state, is about 33 m. long by 22 wide, and only 40 ft. deep. To the s. and n.e. are Kern and Owen's. Mono, sometimes called the Dead Sea of C., in lat. 38°, is 14 m. by 9 m., and elevated 7000 ft. Tahoe, 6247 ft. above tide, is 20 m.

long by 10 wide, and 1500 ft. deep. Donner lake, a little n.w., is sadly associated with the early immigrants; Mirror lake, in Yosemite valley, is famed for its transparency. Clear lake, in Lake co., is 25 m. long. In the n.e. are many alkaline and saline lakes—Klamath, Goose, Eagle, etc. Sulphur, iron, and soda springs abound, and among the hot springs that are favorite resorts are Calistoga, Gilroy, Paso Robles, Santa Barbara, and Matilija.

No other state contains such impressive scenery or so many places of resort. There are the great granite domes of Mts. Whitney, Tyndall, Brewer, Dana, Castle, and Lyell, and the isolated cone of Mt. Shasta, snow-covered most of the year, dotted on its slopes with extinct craters and holding 5 glaciers on its n. side. The coast range is full of beautiful valleys, and among the grander ones of the Sierras are the Yosemite (q. v.), Tuolumne, Hetch-Hetchy, Death, and Upper Kern. The Santa Cruz mountains are called the Adirondacks of the state. The falls of Yosemite creek and of the Merced, Tuolumne, Fall, and other rivers are a few of the many deserving extended notice. The geysers of Pluton river and those in Shasta co., the mud "volcanoes" near San Diego, the petrified forest near Calistoga, the lava beds of Modoc co., the innumerable hot and cold springs, and the fine sea-beaches, rightfully claim attention. The groves of *Sequoia gigantea*, or "big trees," 9 in number, are included between parallels 36° and 38° 15'. The most northern and the first discovered, in Calaveras co. has 100 trees of large size, the highest 325 ft.; the next, 319; while 20 are over 250 ft. The largest in circumference measures 61 ft. six ft. from the ground.

GEOLOGY.—Almost all the n.e. consists of volcanic rocks, and the number of extinct volcanoes, such as Shasta, is large. Eruptive activity continued later in the coast range than in the Sierras. Metamorphic and eozoic formations occur widely in the n.w., and are continued along the Sierras and the San Bernardino mountains. The central mass of the Sierras and their highest peaks in the s. are granite. Tertiary and cretaceous sandstones, the latter, of marine origin, are found in the foot-hills. What is called the auriferous gold belt comprises the detached triassic and jurassic fields bordering the Sierras. The coast range is almost wholly cretaceous and tertiary.

MINERALOGY.—C., though third in the production of precious metals, still leads in the output of gold. This was obtained by washing, as early as 1841, near San Fernando mission; but it was the discovery at Sutter's Mill, near Coloma, in 1848, that made evident the abundance of the metal and attracted the excited throngs of adventurers. Many of these engaged in river mining—i.e., washing in sheet-iron pans or wooden "rockers" the gold from the sands or gravels from or near river channels; others dug the gold "dry" from the crevices of the rocks. About 1851 sluices were introduced, by means of which the gravels or sands were flowed over the bottom of a wooden box provided with blocks of wood or round stones to catch the gold as it sank. Digging soon extended from the rivers and the gulches leading to them to higher ground, where the difficulty of washing was increased; but in 1852 the hydraulic system was brought in. In this, continuous streams of water are directed through powerful nozzles upon a gold-bearing bank or deposit. This was so successful that whole hills were reduced and swept away, but its use was soon forbidden by law, as the detritus threatened to choke the rivers. Nearly all the mines are on the western slope and in the foot-hills of the Sierra Nevadas in a belt of country about 220 m. long by 40 wide, extending into Oregon. The gold is found in a metallic condition, but is usually mixed with silver or other metals. In stream or alluvial deposits ("placers") it occurs as fine scales or coarse grains; in rocks, in quartz veins or ledges; and costly machinery must be used to crush the rock, from which the ore is extracted by amalgamation with quicksilver. Where, as often is the case, the gold-bearing gravels underlie volcanic rock several hundred feet thick, drift or tunnel mining combined with sluicing is necessary. The chief gravel mining region extends from Mariposa co. into Plumas co., or between parallels 37° and 41°, and includes some quartz veins. The profitable quartz mines have decreased in number. Of those belonging to incorporated companies, the Bodie, in Mono co., in three years yielded \$5,500,000 gross and \$2,475,000 net. Silver of rich quality is found, but the output is small. Cinnabar abounds in the Sierras and in the s. part of C., particularly in Monterey and Santa Clara cos.; magnetic iron of superior grade in Sierra co. and in the coast range, where also are deposits of chromic iron and manganese. Iron and copper pyrites exist with gold in many quartz veins; copper, nearly pure, in the n.w. and in the southern coast range, but the real copper belt extends from Plumas co. to Mariposa co., and is from 20 to 25 m. w. of the main gold-bearing belt. Tin is found in the Temescal valley, zinc and lead in the quartz veins of the gold belt, argentiferous galena in San Bernardino co. and e. of the Sierras, platinum in Klamath valley. Among other mineral products are plumbago, cobalt, freestone, buhrstone, granite, basalt suitable for pavements and buildings; rhyolite, bluish and light brown sandstones from San Francisco bay, and from San José a light brown variety, which is almost pure silica, cuts easily and stands fire well. Kern co. yields marbles of many shades; Colfax, drab marbles; El Dorado co., fine white, streaked with blue; and in Inyo co. some of the foot-hills are composed of white marble equal to Italian. Bituminous coal is mined in Monte Diablo and neighboring hills. Hydraulic limestone, bismuth, brick and porcelain-clay, gypsum, alum, sulphur, borax, salt, and diamonds, onyxes, and other precious stones may be added to the list. Bitumen is found in several places, and petroleum in Monterey, Santa Cruz, Ventura, and Los

Angeles cos. The Los Angeles oil has a specific gravity of 42°, is green in color, and its refined products are benzine, gardine, water-white illuminating oil, standard white oil, lubricating gas, and fuel oil. Between 1848, when gold was discovered, and the end of 1896, the total production of gold and silver was valued at \$1,475,434,107, and gold alone, \$1,368,429,278. In 1896 the gold product was valued at \$13,863,281. The quicksilver production was 30,743 flasks, and since 1877, 810,767 flasks. Other mineral products in 1896 were petroleum and bitumen, over \$1,000,000; borax, \$800,000; mineral waters, \$400,000; natural gas, \$150,000; and salt, \$130,000.

ZOOLOGY.—The animals include the black, brown, and the cinnamon bear; panther, gray wolf, wolverene, wild cat, mountain cat, 5 species of fox, fisher, coyote, black-tailed deer, raccoon, otter, badger, skunk, yellow-haired porcupine, hair seal, sea-lion, 3 species of hare, 2 of rabbit, 3 of gopher, 3 of squirrel, 2 of ground squirrel, 6 of rat, 10 of mice, and 16 of bat. The mammals number 115 species, but the grisly bear, elk, antelope, mountain sheep, and beaver are now rare. The 350 species of birds include the golden and bald eagle, vulture (the largest flying bird in North America), buzzard, 19 species of hawk, 9 of owl, raven, magpie, 12 species of woodpecker, 11 of flycatcher, 2 of quail, 4 of humming-bird, 3 of oriole, the roadrunner, cedar-bird, barn swallow, water ouzel, robin, swan, canada goose, mud hen, crane, heron, pelican, albatross, guillemot, loon, and puffin. Among 240 species of fish are the sturgeon, shark, cod, turbot, jewfish, mackerel, halibut, rockfish, pompano, barracouta, and flying fish. Oysters, clams, lobsters, crabs, and shrimps abound. Shad, perch, pike, etc., are found in many rivers, and trout in the mountain brooks and lakes. Salmon ascend the rivers n. of Santa Barbara twice a year. Among reptiles are the rattlesnake, racer, horned toad, and salamander, and in the extreme s. centipedes, scorpions, and tarantulas are occasionally met with. There are 25 to 30 species of ants.

BOTANY.—The native flora comprises about 2500 species, and differs decidedly from that of states lying to the e. Few of its deciduous trees can be used for timber or manufactures, and many common on the Atlantic slope are lacking. Hills shut off from sea breezes are treeless, yet trees and grasses thrive at higher elevations than in the Alps, and 2 trees are found 1000 ft. above the snow line. The w. side of the Sierra Nevada range is thickly wooded, as is that of the coast range n. of 35°; but the eastern slope of the coast range and its whole extent s. of lat. 35° are treeless. The foot-hills up to about 2500 ft. are covered chiefly with black oak, nut pine, and the lofty sugar pine and Coulter's pine. The Douglas spruce, pitch and sugar pines, and white cedar (*Libocedrus decurrens*) occupy a second belt reaching to 5000 ft., and above these, in the central part of the state, coniferæ such as the tamarack pine and lovely fir grow to a height of 7 to 9000 ft. The sequoia, or big trees, are described under *topography*. The coniferæ are numerous, and among them are the redwood, used for railroad ties and house furnishing; the western yellow pine, furnishing lumber, resin, and turpentine; red fir occurring in thick groves and attaining a height of 300 ft., its wood used for ship-building and houses; the fragrant cedar, excellent for inside work and furniture; the black fir, western juniper, twisted pine, arbor vitae, western yew, and the rare Monterey cypress. The chestnut oak is used for tanning, but the abundant and majestic white oak is useless for timber. On hill-sides numerous branching and prickly shrubs, the live oak, madrona, manzanita, coffee berry, etc., form almost impenetrable thickets called chaparral. The numerous brilliant and delicate flowers include the mimulus, larkspur, tulip, lupine, poppy, tiger lily, alfileria, and shooting star. The *yerba buena*, a vine-like plant, resembles the strawberry. The mistletoe and Spanish moss are among the parasites. Wild oats grow to great height on the hills and plains, as do the spiked clover and tulé or reed in river bottoms and marshes. The prickly pear is the only wild fruit that is not insipid. The eucalyptus has been naturalized, but is less valued for economic uses than formerly.

SOIL AND CLIMATE.—In the valleys the soil is either a rich loose loam, or a light or heavy clay called adobe. On elevated table-lands it is rich, mellow, and easily worked; in the timber lands it resembles that in similar localities in the eastern states; even the so-called desert needs only irrigation to make its sands prolific. The soil of the greater part of s. C. is composed of disintegrated granite. Two seasons, the wet and the dry, divide the year; the first so called, because it is the only period during which it rains, though rains are not continuous, and the average fall for the state, 23 in., is less than at Chicago or St. Louis. At Crescent City the average is 34 in.; at Redding, 38; at San Francisco, 23; at Sacramento, 19; at Los Angeles, 12; at Bakersfield, 5; and at San Diego, 10. This season lasts from about the middle of Nov. till April or May. North of Sacramento light snows are not unusual, and in the mountains of the n. and e. snows are heavy and lie long; but the winters are comparatively mild everywhere, and vegetation is not only green but active. At San Francisco snow is almost unknown, the mercury never remains at freezing point 24 hours, and flowers bloom in the gardens at Christmas time. Early spring, comprising the latter part of Feb. and the month of Mar., is the most delightful part of the year. The air is mild, the sky clear, and the landscape gay with flowers. Summers are dry except along the coast for from 6 to 10 m. inland, where fogs are likely to occur, and, except in sheltered places, trade winds prevail. These enter the Golden Gate with peculiar violence, dividing to pass n.w. and s.w., and giving the valleys opening toward San Francisco bay a climate peculiarly their

own. In the high Sierras there is little rain or snow, and at altitudes of from 8 to 12,000 ft. it is warm at noonday. There is so little fear of moisture that on the inland farms sacks of grain are left lying on the ground for months at a time. The great heat of the interior and of the s.e., where, as at Fort Yuma, the average temperature is 92°, is from its dryness easily borne, and sun-strokes never occur. There are no thunder storms in C. In the extreme n. and n.e. the summers resemble those of the eastern states. Everywhere the nights are cool, or at least endurable; the clearness of the atmosphere causing rapid radiation. Owing to the equably cool summer climate of the coast between parallels 35° and 40°, San Francisco in July is cooler than San Diego by 7°, and than New York by 17°, and does not gain its highest temperature until the trade winds cease in September. During the summer the earth becomes dried to a depth of several inches; the air is filled with dust, the vegetation is burned brown, and the smaller streams disappear, a state of things that lasts until the autumn rains begin. The Sacramento and San Joaquin valleys are relatively warmer and colder than the coast region, Sacramento registering 73° in July and 45° in Jan. to San Francisco's 56° and 48°. At Monterey the difference between the average temperature of Jan. and July is 6°; at Los Angeles, 12°; San Diego is 6° or 7° cooler than Charleston or Vicksburg, which are nearly in the same latitude. The prevailing winds at San Francisco are from the s.w.

Among prominent winter resorts are San Diego, noted for its fine harbor, on one side of which is the famous Coronado Beach; Santa Barbara, overlooking the Pacific, is a favorite watering place; Santa Monica is noted for surf bathing throughout the year; Santa Cruz has a fine beach and background of mountains; Monterey, on beautiful Monterey Bay, is associated with the earlier history of the province under Spanish rule; Indio, over one hundred feet below the sea level, is remarkable for the cures effected by its pure air in pulmonary diseases. Los Angeles and the adjoining villages are located in a section that has well been termed "our Italy"—a paradise of rose gardens, vineyards, and lemon and orange groves. Other resorts are the Arrowhead Hot Springs, El Paso de Roble, Napa Soda Springs, and a score of others.

AGRICULTURE.—C. was formerly noted for the generally large size of its farms, dairies, and orchards, and many still remain undivided. The Stanford stock-farm is 1400 acres in extent; the Glenn farm in Colusa co. comprises 60,000 acres, and a vineyard near Sonoma has nearly 500,000 vines. The mild winters and dry summers and the absence of sod in the valleys, making a first plowing easy, are among conditions favorable to agriculture, often offset, however, by drouth, lack of water, and the abundance of rodents. The soil is generally rich, and on the largest area of the state the average annual rainfall is sufficient to mature all cereal crops without artificial irrigation; but irrigation is general in the San Joaquin valley and southward, and is necessary wherever the rainfall at any season is less than 10 ins. The Bear Valley reservoir holds water sufficient to supply 20,000 acres. Artesian wells have transformed many parts of southern C. supposably barren, even in the "Colorado desert."

In nearly every part of C. wheat, barley, rye, oats, hops, and broom-corn can be raised, but the cool nights and dry summers are not favorable to Indian corn. Middle and upper C. produce the most wheat. The varieties used are chiefly the Chilian and Australian. Sowing is done between Nov. 1 and Apr. 1, and harvesting from the middle of June to the middle of July. The average yield per acre is 20 to 25 bush. The wheat has a fine, light-colored berry, the dryness of which makes it peculiarly valuable for shipping, but wheat growing has proved less profitable than fruit culture. The climate and soil are remarkably suited to barley. Oats, rye, and buckwheat occupy but a limited acreage. The sugar-beet is extensively raised, as in Alvarado and Alameda cos., and Ventura co. is celebrated for its beans. Cotton was cultivated as early as 1856, but the yield is small as yet. It grows without irrigation, and has been raised as far n. as Shasta co. The yield per acre is greater than in the southern states, the fiber is fine, long, and white, and the absence of rain during the picking season is a decided advantage. Ramie, New Zealand flax, jute, and tobacco are planted to some extent. The tulé lands of the coast and the river valleys would, it is believed, produce large crops of rice.

Oranges were first planted in Los Angeles, and up to about 1873 the production was almost confined to that region. A large part of central and northern C. has since been found to be adapted to citrus culture, and the citrus belt now extends along the foot-hills from Shasta to Tehachapi. In many places oranges grow without irrigation, and in Nevada co. they are raised at altitudes of from 1100 to 1600 ft. Owing to the dry warmth of the inner valleys and to the longer days in summer, the fruit ripens at Oroville, Newcastle, etc., 6 weeks earlier than at Riverside or Pasadena. In southern C. oranges are gathered fresh from Christmas to July, and lemons and limes all the year. Nine or more varieties are grown, and from the sweet navel, or seedless orange, a non-alcoholic wine is made. The annual shipment of oranges, lemons, and limes exceeds eleven thousand tons. Viticulture was early introduced by the monks, but no specialty was made of it until 1857, when great interest was developed, and the state sent Agoston Haraszthy to Europe to study new methods. In 1880 the State Viticultural Commission was appointed, and now two hundred thousand acres are planted to vineyards. The choicest and hardest European wine grapes have been imported, and are rapidly replacing the less desirable varieties. The phylloxera, which for some years made great havoc, is being overcome by rooting out the inferior kinds, and by grafting choice varieties on native wild vines known as *resistant* vines, which the phylloxera will not

attack. The annual production of wine is over sixteen million gallons, while that of grape brandy has reached twenty-five million gallons. California raisins are equal to the finest Spanish raisins. Fresno county is the principal raisin section of the state. The annual shipment has exceeded thirty million pounds. The blue fig originally grown has been supplanted by varieties of the white fig, which thrive in the dry, warm, alluvial valleys of the interior. In Tehama county the trees yield from three to four crops yearly. Olives are extensively cultivated, and at Lander Station, Shasta county, grow at an altitude of twenty-four hundred feet. The average number of trees planted to the acre is one hundred. The fruit is usually picked from Nov. to Jan., or later, and is either pickled or made into oil. English walnut culture is becoming profitable. The almond crop is about five hundred thousand pounds. Italian chestnuts, filberts, pecans, and pistachio nuts are also raised.

The long list of fruits includes peaches, nectarines, plums, apricots, guavas, apples, pears, cherries, pomegranates, prunes, persimmons, loquats, or Japanese plums, and bananas, which grow as far n. as the Sacramento Valley. The date palm is successfully raised in Fresno and other southern counties, and occasionally fruits in the Sacramento Valley. Apples, plums, pears, strawberries, blackberries, etc., thrive best at high altitudes. An apple orchard near Lake Tahoe is 6200 ft. above the sea. In southern C. guavas and strawberries are gathered nearly all the year. Large quantities of fruit are artificially cooled when picked, and sent to the eastern markets in refrigerator cars—Sacramento shipping more than all the rest of the state; while the demand for the canned and dried fruits comes from all over the world. The annual shipment of dried peaches, apricots, nectarines, and prunes alone exceeds eight thousand tons. Thousands of both black and white mulberry trees have been imported from Italy for the silkworm; both the trees and the silkworm are remarkably free from disease in this climate, and the cocoons are becoming articles of export. No better country than this can be found for bee-keeping. The valleys produce alfalfa and mustard, and the mountains abound in aromatic sage brush and flowers which impart to the honey a delicious flavor. The annual product has reached six million pounds of honey, besides immense quantities of comb and bees' wax. Ostrich farming has been tried, and there are now several ranches. In the vicinity of Stockton large quantities of chicory, mustard, and the Persian insect powder plant are raised.

The native grasses, oats, and clover dry without cutting, but constant pasturage has almost exterminated them and alfalfa in moist regions, and Texas mesquit grass in dry hills and plains are taking their place. Alfalfa yields three to four crops a season. Hay is largely obtained by mowing wheat and other small grains before maturity. Stock are fed through the fall and early winter, but are not housed. This state ranks third in the union in sheep and wool. Several immense ranches are devoted entirely to sheep and cattle raising. Horse breeding has received some attention in recent years; several famous race-horses have come from the ranches of California. The last census reports give the total value of all agricultural crops at over \$100,000,000 per annum.

MANUFACTURES, ETC.—These include foundry and machine shop products, lumber products, and ornamental woods, leather and leather goods, wine and brandy, silk fibre and fabrics, flour, grain bags, salt, acids, chemicals, and many others. San Francisco, besides numerous other manufactories, has immense flouring mills, from which over a million barrels of flour are exported annually; the oldest cordage factory on the Pacific Coast, established in 1858, and covering sixteen acres. Stockton also has immense flour mills. Immense red wood mills are located at Fort Bragg; salmon canneries on the Eel, Klamath, and Smith rivers; salt at Santa Monica, San Diego, and a number of other places; soda at Keeler, and immense factories of various kinds at San José, Los Angeles, San Bernardino, and Sacramento. The latter is also the seat of the immense car shops of the Pacific Railroad. The first beet-sugar factory in the state is at Alvarado.

COMMERCE centers mainly at San Francisco, two thirds of all the merchandise imported entering there, and the great lumber trade of the Pacific Coast finding its chief market in that city. The other customs districts are Wilmington, San Diego, and Humboldt. There are lines of steamers to Alaska, British Columbia, Oregon, etc., and to New York, Great Britain, Hawaii, China, Japan, Australia, and South America. The cargoes to Europe consist mainly of wheat, canned fish and fruits, honey, borax, and ores; to Asia and the islands of the Pacific, large quantities of butter and cheese, canned and cured meats and fish; to Mexico and China, quicksilver. Shipments across the continent include fruits, fresh, canned, and dried, cattle-products, and honey. In the calendar year 1896 the imports of merchandise at the various ports were valued at \$37,291,403, exports, \$40,162,027; imports of coin and bullion \$11,864,424, exports \$11,123,756; total imports, \$49,155,827; exports, \$51,287,783; total foreign trade, \$100,443,610.

BANKING.—In 1896 there were 31 national banks in operation, with combined capital \$7,525,000, deposits \$17,183,282, and reserve \$6,580,814; 174 state banks, capital \$40,000,938, deposits \$53,630,156, and surplus \$17,165,115; 57 stock savings banks, capital \$8,904,025, deposits \$131,653,636, and resources \$147,812,564; and 20 private banks, capital \$1,153,253, deposits \$1,039,019, and resources \$2,632,475. The exchanges at the U. S. clearing-houses at San Francisco and Los Angeles aggregated \$754,162,630; increase in a year, \$25,223,693.

RAILROADS.—The two principal railroad corporations are the Central Pacific and the Southern Pacific. Nearly all the shorter lines are leased to one or the other of these.

The tunnel on the San Francisco and Northern Pacific road between Cloverdale and Ukiah City is two thousand feet long. On the Central Pacific are thirty-three miles of wooden tunnels, known as "snow sheds," and costing from \$40,000 to \$1,100,000 per mile, according to the amount of masonry needed. On the Southern Pacific, just north of Tehachapi summit, is a series of curves, during which the railroad actually crosses its own pathway. The Southern Pacific connects at New Orleans with steamship lines for Europe. In 1896 there were over 7,000 miles of steam railroad in the state, and railroad property was assessed for taxation at \$43,223,344.

CHURCHES, EDUCATION, ETC.—All the leading religious denominations are represented, with a conspicuous absence of the minor sects and of those usually maintained by the foreign element. The Roman Catholic, with its numerous missions, is the largest numerically. The school fund is derived from state, county, and district funds. The state fund is about \$3,000,000. The total value of school property is \$16,408,630; annual expenditure for common schools, \$6,109,082. There are five normal schools and four normal departments. The State University at Berkeley, an outgrowth of the State College chartered in 1855, has a liberal endowment. Its schools of Law, Medicine, etc., are at San Francisco. Lick Observatory (q. v.) is also connected with it. Among the fourteen other colleges in the state are Leland Stanford Junior, at Palo Alto, with a princely endowment; University of Southern California, Los Angeles, with its school of Agriculture at Ontario, and Theological School at San Fernando; the Roman Catholic colleges at San Francisco, Los Angeles, Oakland, and Santa Clara; Pacific Methodist, Santa Rosa; California, at Oakland; Pomona, at Claremont, and University of the Pacific at San Francisco. The Cogswell Polytechnic at San Francisco, founded in 1888, with an endowment of \$300,000 is maintained by the city. There are theological schools at Oakland, San José, and San Rafael; art schools at San Francisco, San Diego, and Sacramento. The California academy of Sciences, founded in 1853, and endowed by James Lick (q. v.), is at San Francisco. Public libraries are found in the principal cities. The first newspaper was published in Monterey in 1846; in 1896 there were 674 newspapers and periodicals.

GOVERNMENT, ETC.—The capital is Sacramento. According to the constitution adopted in 1879, legislative sessions are biennial, begin on the first Monday after Jan. 1, and are limited to 60 days; legislative elections are held on the Tuesday following the first Monday in Nov. No one convicted of embezzlement or defalcation in any state in the union can hold office. Senators (40) hold for 4 years; assemblymen (80) 2 years, and all receive \$8 per day and 10 cents mileage. All state officers hold office 4 years. The governor receives \$6000 salary, and may veto special items in appropriation bills. Males who have lived one year in the state, 90 days in the county, and 30 days in the voting precinct have the right of suffrage, but Chinese and Indians are excluded. The supreme court consists of 7 judges, elected for 12 years and receiving \$6000 salary each. No Judge of supreme or superior court can receive salary unless he swears that no case in his court submitted 90 days previous remains undecided. Each county elects its superior judges. Appropriations to sectarian schools are prohibited. The legal rate of interest is 7 per cent., but any rate is allowed by contract. Women may enter upon or pursue any lawful business, vocation, or profession, and the property of married women belongs to them alone.

The state institutions not educational are the prisons at Folsom and San Quentin, the insane asylums at Napa, Stockton, Agnews, and Ukiah; the State Reform School at Whittier (which is conducted on the cottage plan, and farming and various trades are taught); the Preston School of Industry at Ione city; Home for Feeble-Minded Children at Glen Ellen, and Institution for Deaf, Dumb, and Blind at Berkeley. There are also nineteen orphan asylums, receiving state aid and inspection. The only American naval station on the Pacific Coast is at Mare's Island. Other national institutions are the Presidio Reservation on the Golden Gate—the largest garrison on the Pacific Coast; several forts in different parts of the state, all occupied by U. S. soldiers; and the Soldiers' Home at Santa Monica.

The National Guard of the state numbers about four thousand men, organized into seven regiments and four companies. Occasional encampments are held, and some attention is given to rifle practice. The total number liable to military duty is over 203,000. The naval battalion numbers five hundred.

The registration of voters is required in this state. New ballot laws, based on the Australian system (q. v.), were adopted in 1891.

The electoral votes have been cast as follows: 1852, Pierce and King, 4; 1856, Buchanan and Breckinridge, 4; 1860, Lincoln and Hamlin, 4; 1864, Lincoln and Johnson, 5; 1868, Grant and Colfax, 5; 1872, Grant and Wilson, 6; 1876, Hayes and Wheeler, 6; 1880, Hancock and English, 6; 1884, Blaine and Logan, 8; 1888, Harrison and Morton, 8; 1892, Harrison and Reid, 1; Cleveland and Stevenson, 8; 1896, McKinley and Hobart, 8; Bryan and Sewall, 1.

FINANCES.—The total bonded debt at the end of the biennial term 1893-5 was \$3,377,500, of which \$1,526,500 was held in trust for the state school fund, and \$751,000 for the university fund. In 1896 the total assessed valuations was \$1,266,593,065, and the aggregate county debt, \$4,909,187.

POPULATION.—The pop. in 1830 was 22,500—18,000 Indians; 1860, 379,994; 1880, 864,964—292,874 foreign born, including 18,889 British Americans, 42,532 Germans, 62,962 Irish; colored, 97,513—75,218 Chinese and Japanese, 20,000 of whom were in San Francisco, and 16,277 Indians; pop. 1890, 1,208,130. There are 57 cos.; for pop. 1890 see census tables, vol XV. The largest cities, 1890, were San Francisco, 298,997; Oakland,

48,682; Sacramento, 26,272; Los Angeles, 50,395; San José, 18,060; San Diego, 16,159. Stockton, 14,424. The tribal Indians are on 5 reservations, and numbered 5020 in 1890; Those not under an agent numbered 6669. The aborigines in northern C. are much superior to those in the south. Under Mexican rule the Indians were recognized as owners of their lands, but the U. S. never acknowledged the right. In 1870, there were 29,000 Indians in upper and lower C. The principal tribes were the Klamaths, the Hoopas, the Ukies, the Redwoods, the Tulés, the Tejons, the Siahhs, the Wylackies, the Concous, the Wichumnies, the Coweas, and the Yokas.

See histories of C. by H. H. Bancroft (6 vols.), by Hittell (1885) and Royce (1886); King's *Mountaineering in the Sierra Nevada* (Boston, 1874), Cone's *Two Years in California* (Chicago, 1876), Hittell's *Resources of California* (San Francisco, 1876), Nordhoff's *California* (New York, 1882), Shinn's *Mining Camps* (New York, 1885), Van Dyke's *Southern California* (New York, 1886), Lindley's *California of the South* (New York, 1888).

CALIFORNIA, GULF OF (Span. *Mar Bermejo*, Red sea), an arm of the Pacific ocean dividing the peninsula of lower California from the rest of Mexico. It was originally known as the sea of Cortez, having been discovered under his auspices, and explored by himself. It is 700 m. in length and varies in width from 70 to 150 m. It receives at its upper end the united streams of the Gila and Colorado, and from the e. several streams. It contains many islands, particularly towards its head, and its coasts are broken by numerous small bays. On its western shore are the ports of Loreto and La Paz; on its eastern, those of Mazatlan and Guaymas. Navigation, except in the southern part, is somewhat unsafe. There are pearl fisheries on the western coast.

CALIFORNIA, LOWER OR OLD (Sp. *Baja* or *Vieja* C.), a Mexican territory and peninsula, between lat. 23° 40' and 32° 40' n.; bounded on the n. by C., e. by the Colorado river and the gulf of C., s. and w. by the Pacific ocean; about 750 m. long by 30-150 wide; area, 61,562 sq. m. An expedition sent out by Cortez, 1533, discovered the coast, and in 1536 Cortez himself discovered the gulf of C., which in 1540 was navigated by Alarçon to the Colorado. In 1697 the Jesuits established missions, but were expelled in 1767 and succeeded by Franciscan monks, who in 1772 withdrew to upper C., giving up the field to Dominicans. The missions gradually declined, and in 1833 were secularized. The coast range on the w. and Sierra de la Gigantea, a continuation of the Sierra Nevada range on the e., extend through the peninsula, averaging 3 to 4000 ft. in height, but with peaks exceeding 12,800 ft. The peninsula, which is of volcanic formation and subject to earthquakes, is in its upper part like northern C.: well watered, abounding in fertile table-lands and valleys, and producing all the fruits and vegetables of the n. temperate zone. A few streams, such as the San Rafael, are of considerable size. The s. part has large areas unfit for habitation. The coast is broken by many bays and lined with numerous islands. The summer temperature is agreeable in the n. and s., but excessive along the gulf. Severe rains and violent winds occur in winter. Mineral products include gold, silver, copper, galena, quicksilver, coal, sulphur, lime, gypsum, salt, and diamonds. The northern mountains are well wooded, and the native trees include the pine, cedar, spruce, live oak, cottonwood, acacia, and palm. Cacti of great size grow in the s. Antelopes, moose-deer, and mountain sheep are found in the mountains. Among agricultural products are maize, wheat, manioc, sugar-cane, citrus fruits, pineapples, bananas, grapes, olives, plums, etc. The industries are mining, stock raising, and whale and pearl fishing. Ensenada and La Paz are the capitals. An international company has obtained large grants and concessions from the Mexican government, and emigration from the U. S. is fast developing the varied resources. See Taylor's *Historical Summary of Lower California*; Nordhoff's *Peninsular California* (1888).

CALIFORNIA, UNIVERSITY OF, at Berkeley, 5 m. n. of Oakland, was established in 1868, as a non-sectarian institution, under the laws of the state, and united with it the coll. of C., organized in 1855. Instruction was begun in Oakland in 1869. The university occupies a beautiful site of 250 acres, and has among its buildings an art and library building with over 65,000 vols., an observatory, a well-equipped gymnasium, and mechanical, mining, and chemical laboratories. Its museums of geology, mineralogy, zoology, and botany are remarkably rich. The departments of instruction comprise: I. In Berkeley, colleges of letters, social sciences, natural sciences, agriculture, mechanics, mining, civil engineering, and chemistry. II. At Mt. Hamilton, the Lick astronomical department (Lick observatory). III. In San Francisco, colleges of art, law, medicine, dentistry, pharmacy, and veterinary science. There are also graduate courses. Women are admitted on equal terms with men.

The University's endowment in 1897 was capitalized at about \$8,900,000; its income for 1895-96 was \$286,000; it has assurance of several millions more, to become available when permanent building plans, already well advanced, shall have been matured. The univ. is entitled to the avails of the public lands given to the state for an agricultural coll. by the act of congress of 1862. Tuition is free in the univ. proper, but not in the professional departments, excepting that of law. Professors and instructors, 1896-97, 240; students, 2200; Martin Kellogg, LL.D., president.

CALIGULA, CAIUS CÆSAR AUGUSTUS GERMANICUS, Roman emperor (37-41 A.D.), the youngest son of Germanicus (nephew of Tiberius) by Agrippina, was b. 31st Aug., 12 A.D., at Antium, and was educated in the camp, where the soldiers gave him the by-name C., from the half-boots (*caligæ*) which he wore. On the death of his brother

Drusus, he was made augur in his stead: and on the death of Tiberius (37 A.D.), who, it was suspected, had received foul-play at his hands, it was found that he had been appointed co-heir along with the grandson of Tiberius, but the senate and the people allowed C. supreme and sole authority. In the beginning of his reign, he appeared hardly likely to fulfill the threat of Tiberius, who had talked of educating C. "for the destruction of the Roman people." He was, to appearance, lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own family. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, founded on no principle, or even humanity of heart, and co-existed with the most savage voluptuousness and lust. Consequently, when illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In addition to the senseless prodigality with which he commenced his career—expending in one year the enormous wealth left by Tiberius (720 millions of sesterces)—he began to manifest the most barbarous propensities. He banished or murdered his relatives, excepting his uncle Claudius and sister Drusilla (with whom he carried on incestuous intercourse); filled Rome with executions, confiscating the estates of his victims; amused himself, while dining, by having victims tortured and slain in his presence; and uttered the wish "that all the Roman people had but one neck, so that he might decapitate Rome at a blow!" To vie with Xerxes, he made a bridge of ships over the bay between Baïæ and Puteoli (a distance of three Roman miles and 600 paces), and celebrated the exploit by a costly banquet on the middle of the bridge, and by collecting on it great numbers of people, and causing them to be drowned. His favorite horse was stabled in a palace, fed at a marble manger with gilded oats, was made a member of the college of priests, and afterwards raised to the consulship. As a climax to all his absurdities, he declared himself a god, and had temples erected, and sacrifices offered to himself. At length a conspiracy was formed, and he was assassinated 41 A.D.

CALIPASH', the name given by epicures to that part of the turtle that adheres to the upper shell, and is of a greenish color. The corresponding flesh next to the lower shell is of a light yellow, and receives the name *calipee*.

CALIPH (Turk., a successor), the title of Mohammed's successors in temporal and spiritual power, from which the historians of the middle ages designated the Arab empire founded by these princes the **CALIPHATE**. This empire, for two or three centuries, exceeded even the Roman empire in extent. As Mohammed died without leaving any sons, a contest arose concerning the inheritance of his power, which terminated (632 A.D.) in the triumph of Abubekr (q.v.), one of his fathers-in-law, over Ali, his nephew and son-in-law. Abubekr now assumed the title of Caliphet-Resul-Allah—i.e., representative or deputy of the prophet of God. He sent forth his armies for the extension of Mohammedanism, and after several victories over the forces of the Byzantine empire, conquered Syria. He was succeeded in 634 by Omar, another father-in-law of Mohammed, by whom Egypt and Jerusalem were annexed to the caliphate. He assumed the title of Emir-al-Mumenin—i.e., prince of the faithful—a title which all subsequent caliphs retained. Othman, a son-in-law of the prophet, was the third C., and was elected by six persons appointed by Omar before his death. During his reign (644–56 A.D.), the Arabian empire grew with extraordinary rapidity, being extended into Persia, and westward along the n. coast of Africa as far as Ceuta. The Byzantine emperors recovered Egypt; but it was wrested from them again at a prodigious expense of blood. The people of Medina elected Ali-ben-Abi-Taleb as C. upon the death of Othman. The Shiites regard him as the first true imam or high-priest, and honor him and his son Hassan almost equally with Mohammed himself. Contests against rivals prevented him from doing much for the extension of the caliphate. Moawijah, the governor of Damascus, having made himself really independent during Ali's life, and having extended his power over Syria, Egypt, and part of Arabia, became C. in 661, and founded the dynasty of the Ommiades, making the caliphate hereditary. He removed the seat of the caliphate to Damascus. His armies ravaged Asia Minor, and laid siege to Constantinople, but could not take it. He made important conquests, however, in Central Asia. The caliphate did not remain long in the family of Moawijah, and it frequently happened that in one or other of the subject countries a governor raised himself to a temporary independence; and rival caliphs frequently contended for power. Abdalmelek (685–705 A.D.) united all the Moslems under his dominion. Under his son, Walid I., the caliphate reached its zenith of prosperity, the Arabs conquering Turkestan in 707, Galatia in 710, and Spain in 711. Under Hesham, the progress of the Arabs in the west was arrested by Charles Martel at Tours (732 A.D.), and at Narbonne (736 A.D.). The dynasty of the Ommiades in Asia terminated with Merwan II. in 752, giving place to that of the Abbasides. But a branch of the Ommiades founded an independent caliphate at Cordova, and another founded one in Arabia, which subsisted till the 16th century. Abul-Abbas (750–54 A.D.), the first Abbaside C., signalized himself by his cruelty and the torrents of human blood which he shed. His successor, Abu-Jafar, called Al-Mansur, a patron of the arts, but a persecutor of Christians, founded Bagdad (q.v.), and removed the seat of the caliphate thither. From the beginning of the 9th c., the Arab empire, which had suffered much from corruption and internal disorganization

under the last caliphs of the Omniade dynasty, and had never completely recovered, showed increased signs of decay. Even under the C. Harun-al-Raschid, whose praises the eastern poets were accustomed so much to celebrate, independent kingdoms were established (800 A.D.) by the Aghlabides in Tunis, and the Edrisides in Fez. In 821, Taher, the governor of Khorassan, made himself independent, and established a dynasty there, and other governors of provinces followed his example. But under the C. Al-Mamun, the Arabians conquered Sicily and Sardinia, the former of which they held till it was taken from them in 1035 by the Normans; and the latter, till it was conquered by the Pisans in 1051. The C. Motassem (833-42 A.D.) was the first to employ Turkish soldiers; but the practice was followed by his successors; and the Turkish body-guard soon became a formidable power in the caliphate, and about the middle of the 9th c. assumed the right of deciding the succession to the throne. Many of the caliphs, meanwhile, were base voluptuaries, and of the others, some were of little capacity, and their power rapidly declined. Ere the middle of the 10th c., the caliphs themselves exercised a mere nominal sovereignty, whilst the emirs, like the mayors of the palace towards the close of the Merovingian dynasty among the Franks, possessed all real power. The princes of the Fatimide dynasty, which succeeded that of the Aghlabides in Tunis, having made themselves masters of Egypt in 970, assumed the title of C., so that there were now three caliphates—at Bagdad, at Cairo, and at Cordova. In the 11th c., the caliphs of Bagdad were still acknowledged as the spiritual chiefs of all the Moslems; but their temporal power scarcely extended beyond the walls of Bagdad. Bagdad itself became the prey of a Mongol horde in 1258, and the representative of the caliphs fled to Egypt, where, under the protection of the Mamelukes, who had made themselves masters of that country in 1250, he retained his title and spiritual power, which he transmitted to his successors, who continued to reside there till the Turks conquered Egypt in 1517, when the last of them was carried to Constantinople; and since that time the Turkish sultans have assumed the title of C., and claimed to be regarded as the spiritual chiefs of all the Moslems, a claim to which little respect has ever been paid except within the limits of their own empire.

CALIPPIC CYCLE. See PERIOD.

CALIPPUS, or **CALLIPPUS**, an astronomer of Greece, in the 4th c., B.C. He corrected earlier measurements of time by Meton's cycle of 19 years, which he found to be six hours too long. He made the year $365\frac{1}{4}$ days.

CALISAYA BARK. See PERUVIAN BARK; CINCHONA.

CALISTHENICS, physical exercise designed to promote strength and proper bodily development. The usual apparatus includes a pair of light dumb-bells, Indian clubs, stout wooden rings, a wooden staff about 4 ft. long, horizontal bars, bags of beans for throwing and catching, and two weights running upon vertical cords. The practice of calisthenics is growing among schools for girls.

CALITRI, a t. of Italy, in the province of Avellino, near the Ofanto, and about 7 m. e.n.e. of Conza. It has a pop. of 6000, who are chiefly engaged in agricultural pursuits. Sheep are reared to a considerable extent in the vicinity.

CALIVER was a matchlock or fire-arm about midway in size and character between an arquebuse and a musket; it was small enough to be fired without a rest or support.

CALIXTINES, a Bohemian religious sect, so named from the Latin *calix*, a cup, because they contended for giving the cup, as well as the consecrated wafer, to the laity. Their confession of faith (1421) contained the following articles: 1. That the word of God ought to be freely and regularly preached by the priests of the Lord throughout Bohemia; 2. That the eucharist in both kinds ought to be administered to all burdened with "no mortal sins," according to the language and command of the Savior; 3. That the clergy should separate themselves from secular affairs; 4. That all "mortal sins," and especially public ones, such as debauchery and simony, and any other disorders contrary to the law of God, should be prevented or punished by those who were the lawful authorities in such matters. In other main points they were moderate followers of John Huss, and were opposed to the more extreme sect of Taborites (q.v.). Their peculiar articles of faith were conceded by order of the council at Basel (1433); and having prevailed over the Taborites in the conflict which took place at Boemischbrod, 30th May, 1434, they became the dominant party in Bohemia, and exercised considerable influence over political affairs. Gradually, however, the C. lapsed from the severity of their four articles, while the schism of the energetic Taborites, and later of the Bohemian brethren (q.v.), rendered them completely powerless.

CALIXTUS, a name borne by three popes. The first was born a slave, and is said to have suffered martyrdom, 223 A.D. The second (d. 1124) was a son of the count of Burgundy, and a ruler of firmness. He expelled the anti-pope Gregory from Rome in 1120, stormed the castle in which he took refuge, and made him a prisoner. He also concluded with Henry V., of Germany, the famous Concordat of Worms (1122) by which the long dispute over the question of investiture (q.v.) was compromised. The third was of the Spanish Borgia family, and his leading idea was to institute a great crusade against the Turks, in which he failed. He died in 1458, and was succeeded by Alexander VI., one of the most celebrated of the Borgia family.

CALIXTUS, GEORG (properly, *Callisen*), an eminent theologian of the Lutheran church, was born 14th Dec., 1586, at Medelbye in Schleswig; studied at Flensburg and Helmstedt; and, in 1605, became professor of philosophy in the latter of these cities. Two years after, he betook himself to theology, and attracted great attention by the breadth and originality of his views. After traveling for some time in Germany, Holland, England, and France, where he made the acquaintance of the most learned men of his time, he returned to Helmstedt in 1614, and was appointed professor of theology. His genius, the depth of his knowledge, and his large experience of the world and of men, which he had acquired in his travels, developed in him a spirit of great tolerance towards all who held their religious opinions honestly, whatever these might be. Although his dissertations on the Holy Scripture, transubstantiation, communion in one kind, etc., are acknowledged by learned Catholics to be about the most solid and admirable which have been composed by Protestants against the distinctive doctrines of Catholicism, he was, on account of some statements in his work, entitled *De Præcipuis Religionis Christianæ Capitibus* (Helmstedt, 1613), which seemed favorable to Catholic dogmas, and of others in his *Epitome Theologiæ Moralis* (Helmstedt, 1634), *De Tolerantia Reformatorum*, etc. (Helmstedt, 1658), which approached too near to the Reformed or Calvinistic standpoint, declared guilty of abominable heresy by the adherents of the letter of the Concordienformel—i.e., the orthodox and dogmatically rigid Lutherans. C. felt keenly that the polemical harshness of Lutheranism was a serious obstacle in the way of a great Catholic Christianity, and that Protestantism must assume another form before it could hope to become the religion of Europe. Under this conviction, B. endeavored to show that the oldest and most fundamental articles of the Christian faith—viz., the facts embodied in the "Apostles' Creed"—were common to all Christian sects. In subsequent dissertations, having stated that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation; and finally, at the religious conference of Thorn, in 1649, whither he was sent as a mediator by the elector of Brandenburg, having been on more intimate terms with the Calvinistic than the Lutheran theologians, C. was accused of apostasy. Fortunately, however, he had powerful friends, who stood firmly by him, and through their help he was enabled to retain his professorial chair till his death, on 19th Mar., 1656.

CALL, WILKINSON, b. Ky., 1834; became a lawyer; was elected to the U. S. senate, after the war, but was not allowed to take his seat; elected to the U. S. senate as a Dem., 1879, and continuously re-elected, 1885, 1891, from the state of Florida.

CALL, a term often used in reference to various theological and ecclesiastical subjects.—1. The command or invitation to believe in Jesus Christ, is designated the *call of God*, or the *gospel call*. Calvinistic theologians make a distinction between a *general call* and a *special* or *effectual call*. The former is addressed, they say, to all to whom the word of God comes; but it is insufficient of itself to induce any man to the act of faith, and requires, in order to its efficacy, that it be accompanied by the special and irresistible grace of the Holy Spirit. They are careful, however, to state that the general or outward calling by the word always precedes and accompanies the special and effectual calling by the Spirit. The notion of an inward call by the Spirit of God in the soul, unconnected with outward calling by the word, belongs not to Calvinistic, but to mystic theology.—2. A call to office in the church, and particularly to the ministry of the gospel, is regarded by Christians generally as proceeding from God; and the church of England requires of candidates for ordination an express profession that they trust they are so moved of the Holy Ghost.—3. A call by the people who are to be under the pastoral care of a minister has been generally regarded in the Christian church as necessary to the establishment of the pastoral relation. But there have been great differences of opinion as to what constitutes a sufficient call, and great differences of practice with regard to it. Some of the principal ecclesiastical dissensions in Scotland have had their origin in this question. The election of a pastor by the *Christian people* of his *parish* or *congregation*, has been contended for by many as the true call, or the best kind of it; others, approving of patronage with certain limitations, contended no less earnestly for the right of the people to be consulted, so that without their concurring by a call, the patron's presentee should not be held entitled to be inducted into the pastoral office; and according to the practice of the church of Scotland, this concurrence was always at least formally sought. Questions concerning the call and its proper value, supposed to have been determined by the earl of Aberdeen's act, passed when the *disruption* of the church of Scotland took place in 1843, were not finally settled until 1874.

CALL, a stipulated sum to be paid towards a share in a joint-stock undertaking. For example, in a \$50 share, there are usually at least four calls of \$12.50 each, the calls being made at intervals of not less than three months.

CALL, a military musical term meaning a signal on the trumpet.

CALL is a metal whistle used by the boatswain and his mate on shipboard. Various strains or kinds of sound produced denote signals or orders for hoisting, heaving, lowering, veering, belaying, letting-go, etc. These sounds are as much attended to by seamen, as those of the drum, bugle, and trumpet are by soldiers. At one time, a gold call, with a chain, used to be the badge of an admiral.

CALLA, a genus of plants of the natural order *araceæ*, or, according to some botanists, of the natural order *orontiaceæ*, which is distinguished from *araceæ* only by having hermaphrodite flowers. The genus *calla* is characterized by a flat spathe (q. v.) within which is a cylindrical spadix (see *SPATHE*) covered with naked flowers, appearing as a mere mixture of stamens and pistils, and a one-celled ovary with 6 to 8 erect ovules. The known species are few and natives of very different climates. *C. Palustris* is found in swamps in Europe, Siberia, and North America, but not in Britain. It has a creeping root-stock, and heart-shaped, stalked leaves, the midrib of which is prolonged beyond the blade into a point; the spathe is white, and the spadix yellow. The root-stock is extremely acrid and caustic; but, being deprived of its acridity by grinding, boiling, and macerating, is made by the Laplanders into a kind of bread called *missebroed*, which they hold in high estimation.—The well-known and beautiful *Richardia Ethiopica* was formerly included in this genus, and is often still called calla.

CALLAHAN, a co. in n. w. Texas; on the Texas and Pacific railroad; 900 sq. miles. It has a rocky and broken surface, but good for grazing. Pop. '90, 5434. Co. seat, Baird.

CALLANDER, a village in Perthshire, on the left bank of the Teith, 17 m. n.w. of Stirling. It lies in a beautiful and romantic situation, surrounded by high mountains and Highland lakes. Hence it is much frequented by tourists, who make this place a center to visit Benledi, the Trosachs, the Bracklin falls, and Lochs Lubnaig, Vennachar, Achray, and Katrine. Pop. in '91, less than 2000.

CALLAO, the port of Lima, the capital of Peru, connected with that city by a railway of 6 m. in length. It stands in lat. 12° s., and long. 77° 13' w. Fine harbor-works, with extensive pier and dock accommodation, were completed in 1875. The roadstead is large, free from rocks, and safe, being sheltered by the island of San Lorenzo. The exports are guano, specie, copper, cotton, bark, and hides. C. contained (1890) 35,500 inhabitants. The present C. dates only from 1746, when the original city was submerged and destroyed by an earthquake.

CALLAWAY, a co. in e. Missouri, on the Missouri river; 760 sq. m.; pop. '90, 25,131, includ. colored. The soil is mainly prairie, and fertile, producing corn, tobacco, potatoes, butter, wool, etc. Co. seat, Fulton.

CALLOWAY, a co. in s.w. Kentucky, on Tennessee river; 434 sq. m.; pop. '70, 9410—812 colored; in '90, 14,675. The surface is varied, and soil fertile, producing corn, tobacco, etc. Co. seat, Murray.

CALL CHANGES. See *BELLS*.

CALLCOTT, Sir AUGUSTUS WALL, R.A., a distinguished English landscape painter, was b. at Kensington, London, in 1779. In 1803, he devoted himself to landscape painting; in 1810, he was made a member of the royal academy; was knighted in 1837; and in 1844 made conservator of royal pictures. His landscapes are remarkable for their beauty, clear definition of objects, good drawing, and truthful natural coloring. He has been called the English Claude, a designation to which he is not altogether unentitled. He died Nov., 1844.

CALLCOTT, JOHN WALL, a distinguished musical composer, elder brother of the above, was b. at Kensington, 1766. Too nervous to be a surgeon, for which he was intended, he devoted his attention to music, and in 1785 won three of the four gold medals annually given by the Catch club, the admired *O Sovereign of the Willing Soul* being one of the successful pieces. During the next ten years, he obtained twenty of the medals given by the same society. In 1785 he was made bachelor, and five years afterwards doctor of music at Oxford. In 1805, he published his *Musical Grammar*; in the following year his mind gave way under the continuous strain to which it had been subject. He recovered again, but only for three years, when he relapsed, and continued insane until his death in May, 1821. He was one of the most eminent composers belonging to the British school of music, and especially celebrated for his glee compositions. His choicest productions were published in two volumes by his son-in-law, Mr. Horsley, in 1824.

CALLEJA, Don FELIX DEL REY, 1750-1820; count of Caldron, commanding the Spanish forces in Mexico during the Hidalgo insurrection. In Jan., 1812, he captured the fortress of Zitacuaro and murdered all the inhabitants; and in the same year he captured Hidalgo's successor, the priest Morelos, who was at once shot. For these acts he was made viceroy and ennobled.

CALLERNISH, or *CALLANISH*, a district on the w. coast of the island of Lewis, about 16 m. from Stornoway, remarkable for its circles of standing stones (q. v.). There are four circles, at no great distance from one another, but without any visible relation. The principal one is of a more than usually elaborate design.

CALL OF THE HOUSE is an imperative summons to every member of parliament of either house on some particular occasion, when the sense of the whole house is deemed necessary. In the *house of lords*, when any urgent business is deemed to require the attendance of the lords, it has been usual to order the house to be called over; and this order has sometimes been enforced by fines and imprisonment upon absent lords. On some occasions, the lord chancellor has addressed letters to all the peers, desiring their

attendance, as on the illness of George III., 1st Nov., 1810. The most important occasion on which the house was called over, in modern times, was in 1820, for the trial of queen Caroline.

When the *house of commons* is ordered to be called over, it is usual to name a day which will enable the members to attend from all parts of the country. The interval between the order and the call has varied from one day to six weeks. If it be really intended to enforce the call, not less than a week or ten days should intervene between the order and the day named for the call. The order for the house to be called over is always accompanied by a resolution "that such members as shall not then attend, be sent for, in custody of the sergeant-at-arms." And it was formerly the custom to desire the speaker to write to all the sheriffs to summon the members to attend. On the day appointed for the call, the order of the day is read and proceeded with, postponed, or discharged, at the pleasure of the house. If proceeded with, the names are called over, according to the counties, which are arranged alphabetically. The members of a county are called first, and then the members for every city or borough within that county. The counties in England and Wales are called first, and those of Scotland and Ireland in their order. This point is mentioned, because it makes a material difference in the time at which a member is required to be in his place.—See *May's Proceed. in Parl., on Attendance of Members*.

CALL TO THE BAR is the formal expression by which the admission of law-students to the rights and privileges of legal practice in America, England, and Ireland is publicly announced. In Scotland the corresponding expression is *Passing Advocate*. See **ADVOCATE**; **ATTORNEY**; **BARRISTER**; **INNS OF COURT**.

CALLICHTHYS (Gr. *kalos*, beautiful, *ichthys*, a fish), a genus of fishes of the family *siluride* (q.v.), having the body almost entirely covered by four rows of large, hard, narrow, scaly plates, two rows on each side. The head is also protected by a sort of helmet. The mouth is small, the teeth very small; two long barbules hang from each angle of the mouth. The species of this genus are natives of warm climates, particularly of South America. They are interesting because, when the streams or pools which they inhabit dry up, they make their way across the land to some other piece of water, even although at a considerable distance. They also sometimes bury themselves in the mud of wet meadows, out of which they are digged. They have no special organs for carrying a supply of water with them, like the climbing perch, but are supposed to retain a little between the plates of their body. A still more interesting part of the natural history of these fishes is their making regular nests, generally of leaves, in which they deposit their eggs, near the margin of the water, at the beginning of the rainy season, the male and female uniting in watching them until they are hatched. These habits are shared by the species of the allied genus *doras*, in which the lateral plates are broader, keeled, and each ending in a spine.

CALLICRATES, a Greek architect in the 5th c., B.C., who, assisted by Ictinus, was the builder of the Parthenon.

CALLICRATIDAS, the successor of Lysander in command of the Lacedemonian fleet against the Athenians, 406 B.C. After two successful battles he was defeated in a third, thrown overboard, and drowned.

CALLIÈRES BONNÈVUE, LOUIS HECTOR, Chevalier de, 1639–1703; a French army officer, governor of Montreal in 1684, and in 1687 leader of the advance of the forces invading the lands of the six nations in New York. He visited France to urge the seizure of the city of New York as a security for French supremacy in Canada. In 1699, he was made governor-general of Canada.

CALLIGONUM, a genus of plants of the natural order *polygoneæ* (q.v.), having a quadrangular fruit (*achentum*, q.v.), winged at the angles. The best known species is *C. pallasiæ*, a succulent shrub found on the sandy steppes near the Caspian sea, and in the lower part of the basin of the Volga, where its acid fruit and its also acid shoots often serve to allay the thirst of the Kalmucks and of weary travelers. Its root strikes deep into the sand, is swollen at its upper part, and when cut there, gives out a nutritious gum resembling tragacanth, which is also obtained by pounding and boiling it, and on which the Kalmucks feed in times of scarcity.

CALLIMACHUS, an eminent poet, grammarian, and critic of the Alexandrian period, flourished about the middle of the 3d c. B.C. He was of a distinguished family at Cyrene, in Libya; taught grammar and belles-lettres in Alexandria; was a favorite of Ptolemy Philadelphus, and his successor Ptolemy Euergetes; and was made principal librarian of the Alexandrian library. He wrote many works on the most various subjects (Suidas mentions 800), but only fragments are extant; nor have we many of his poems; but the poems which we have, bear the marks of an age when the artificial had obtained a preference over the natural. See the ed. of Wilamowitz (1882).

CALLIM'ACHUS, an architect and artist of Greece, who lived about 400 B.C., and is said to have been the originator of the Corinthian column.

CALLING THE DIET is the Scotch term for *arraignment* (q.v.), although the forms are different. In Scotland, excepting in cases of high treason, there is no grand jury, but the procedure is briefly as follows: Before a prisoner can be tried, a written or printed

copy of the indictment preferred against him must have been served 15 days before the trial, with a copy of the list of witnesses to be examined against him, and also of the jury panel. When, therefore, he is placed at the bar of the court, and called on to plead, he is presumed to know the nature of the charge made against him. But if it be desired by him, or by his counsel, the clerk in the first instance reads the indictment aloud in open court—the same being a well-prepared syllogistic statement of the facts, which the prosecutor is prepared to prove. He is then called upon to state his objections to the relevancy, and to have such relevancy disposed of by the court, before being called on to plead to the fact. If the judgment of the court is in favor of the objection, the prosecution for the time fails, and the prisoner is sent back to jail, to abide another indictment, unless the prosecutor chooses to abandon the case against him altogether. See INDICTMENT; VERDICT.

CALLINUS of EPHEBUS, reputed to have been the earliest of the Greek poets, lived about 700 B.C. One of his elegies has been preserved to the present time.

CALLIONYMUS. See DRAGONET.

CALLIOPE (i.e., the sweet-voiced), was, according to the ancients, the first of the Muses (q.v.), and presided over epic poetry, or over poetry in general. She was said to be the mother of Orpheus, of the Sirens, etc. She was usually represented with a style and wax tablets.

CALLIOPE. See MUSICAL INSTRUMENTS.

CALLIPERS, a kind of compasses with curved legs, used by turners and other workmen for measuring the diameters of cylindrical, spherical, and other curved work. The C. are laid over the work, and opened or closed until both points just touch the periphery; then the C. are laid upon a rule, and the extent of their opening measured, or the size is compared with a pattern.

CALLIRHOË, a fountain near Athens, called the fountain of nine springs, because its waters were distributed in that number of channels.

CALLISTE'IA, a Grecian festival at which a prize was awarded to the most beautiful woman. But among the Elians men were the competitors, and the victor received a suit of armor which he dedicated to Minerva.

CALLISTHENES, of Olynthus, was the son of Hero, a cousin of Aristotle. C. was b. about 360 B.C.; he was educated by Aristotle along with Alexander the great. He devoted himself to the study of natural and political history, and accompanied Alexander the great in his expedition to India. He incurred the displeasure of the courtiers and royal favorites, and of Alexander himself, who was displeased by his remonstrating against his intended assumption of divine honors, and in general by his bold, indiscreet, outspoken ways; and he was put to death on a pretended charge of treason, 328 B.C. Only a few fragments of his historic works remain, and these are not valuable. The *History of Alexander* ascribed to him, of which there are several MSS. in the Paris library, is evidently a production of the 7th c., and rather a romance than a history.

CALLISTRATUS, an orator of Athens whose eloquence led Demosthenes to devote himself to public speaking. For surrendering Oropus (after a heroic defense) to the Thebans, he was condemned to death, 361 B.C., but he fled to Macedonia, where he founded the city of Datum, afterwards called Philippi. At a later period he returned to Athens and was put to death.

CALLISTO (also written CALISTO), an Arcadian maiden, the attendant upon Diana. Zeus having conceived a passion for her, took the form of Diana, and accompanying Callisto to the chase, overcame her virtue. One day when bathing, her condition became apparent to Diana, who in anger changed Callisto into the shape of a bear. Zeus subsequently placed her in the sky in the form of a constellation, since known as the Bear.

CAL'LITHRIX. See SAGOIN.

CAL'LITRIS. See SANDARACH.

CALLOSITIES. See CORNS.

CALLOT, JACQUES, one of the most eminent artists of his time, was b. at Nancy, 1592. Proceeding to Rome, he commenced drawing and engraving under Thomassin in his eighteenth year. He next went to Florence, where, by numerous spirited etchings, he gained great fame, and engraved for Cosmo II., grand duke of Tuscany, a series of plates of court-festivals, etc. When his patron died (1621), C. returned to his native place, and increased his reputation by a copious series of etchings, including six plates of the siege of Breda. By order of Louis XIII., who invited C. to Paris, etchings of the sieges of Rochelle and the Ile Rhé were executed; but C. refused to commemorate by art the capture of his native town, and, declining the pension offered by the king, returned to Nancy, where he died, 1635. His activity as an artist was marvelous. Of his engravings, 1600 are still preserved at Dresden. As helps to a vivid conception of the manners, conditions of life, events, etc., in the 17th c., they are invaluable. C.'s *Misères de la Guerre*, a series of 18 plates, are especially celebrated. See works on Callot, by Meaume (2 vols., Nancy, 1860), Dumast (Nancy, 1875), Houssaye (Paris, 1875), and Thausing (Vienna, 1881).

CALLUNA. See HEATH.

CALLUS. This term was employed in old surgical works, and is still used popularly to indicate the exuded material by which fractures of bones are consolidated together. If the broken ends are accurately adjusted to each other, there is no projection of C., but merely a slight deposition of it between the two surfaces; if, however, the adjustment is not accurate, the C. is effused in such quantity as to fill up any interspaces that may exist, and as often to form a considerable hard swelling round the seat of the fracture; any excess is, however, usually absorbed during the last stage of the repair of a fracture. When the broken ends are allowed to move upon each other—which, of course, should be always prevented, if possible—a ferule of new bone, encircling both fragments for some little distance, so as to splice them together, till they are united by a permanent C., is formed; this is termed a *provisional callus*.

CALMAR. See KALMAR.

CALMET, AUGUSTINE, an exegetical and historical writer, and learned Benedictine, was b. at Mesnil-la-Horgue, near Commercy, Feb. 26, 1672, and, in 1689, entered the order of Benedictines. In 1698, he was appointed teacher of philosophy and theology in the abbey Moyen-Moutier; in 1704, sub-prior of a convent of learned monks at Münster, in Alsace; and in 1706, he went to Paris, to superintend the publication of his *Commentary on the Bible*. He was afterwards appointed prior at Lay (1715), abbot of St. Leopold (1718), abbot of Senones in Lorraine (1728), and died at Paris, Oct. 25, 1757. His exegetical writings have been commended and studied with advantage by both Roman Catholics and Protestants. The *Commentary on the Bible* (23 vols., Paris, 1707–16), though marked by the author's deficient knowledge of the oriental languages, contains valuable researches in biblical antiquities. C.'s *Historical and Critical Dictionary of the Bible* (4 vols., Paris, 1722–28) was translated into English, German, and other languages, and has passed through many editions. His other works—a *History of the Bible*, and of the *Jews* (1718), and a *Universal History* (1735–71)—are mere compilations; but his *History of Lorraine* is founded on original researches. Solid criticism and vigorous intellect are wanting in all his works.

CALMS, or CALM LATITUDES, are those parts of the ocean, near the equator, which are subject to total absence of wind for long periods together. The part of the ocean where C. are most looked for, is between the region of the trade-winds and that of the variable winds. See WIND. It is almost as much dreaded by seamen as a region of storms, for the ship is unnavigable; and during a calm of many weeks, food and water may be nearly exhausted, at a point too far from land for boats to reach it. Where a calm occurs unexpectedly, it is likely to be followed by violent storms.

CALMUCKS. See KALMUCKS.

CALNE, a parliamentary borough and ancient t. of Wiltshire, on the river Marden, 31 m. n.n.w. of Salisbury. It lies in one of the many valleys of the chalk escarpment of this part of England, with the plateau of the Marlborough downs and Salisbury plain on the e. and south. In 1863, a branch line was opened to C., 6 m. from the Chippenham station of the Great Western railway. The principal industry is the curing of bacon. The manufacture of woollens, formerly of importance, is now extinct. There is also a weekly corn-market. The town contains a technical art school. Pop. of the town in 1891, 3495. The parliamentary borough, formerly returning two members to parliament, but now only one, includes part of Blackland and Calstone. Many Roman remains have been found here. The West-Saxon kings had a palace at Calne, but no traces of it now remain. At a synod held here by St. Dunstan in 977, relative to the celibacy of the clergy, the floor of the room in which the synod sat gave way, precipitating all to the ground but St. Dunstan, who presided. On an almost perpendicular declivity 3 m. e. of C. is the figure of a *horse*, 157 ft. long, in a spirited attitude. It was cut out in white chalky ground in 1780 by Dr. Allsopp, and is visible 50 m. off. Dr. Priestley resided at C. 1770–80.

CALOEE. See BOEHMERIA.

CALOMARDE, DON FRANCISCO TADEO, Count, a Spanish statesman, was b. in 1775 at Villet, in Aragon. He studied at Saragossa, where he passed as an advocate. After the expulsion of the French, and the return of Ferdinand VII. in 1814, C. was among the first to hurry to Aragon, and do homage to him as an absolute monarch. As a reward of his obsequious celerity, he obtained the highest office in the *secretaría general de Indias*, but lost it on account of accepting a bribe. On the restoration of the constitution in 1820, he unsuccessfully courted the favor of the liberals; but when the French army in 1823 enabled the king once more to rule despotically, C. was appointed secretary of the *cámara del real patronato*, one of the most influential offices in the kingdom. Not long after, the king made him minister of justice. While he held this function, he persecuted the liberals with cold-blooded savageness, recalled the Jesuits, re-opened the monasteries, and closed the universities. He also secretly favored the party of Don Carlos; but, on the other hand, by treating any unseasonable outbreak with a strictness bordering on cruelty, he preserved himself from the suspicion of being implicated in their schemes. In 1833, when Ferdinand was supposed to be on his death-bed, he was prevailed on by C. to re-introduce the Salic law, by which Christina

was excluded from the throne, and Don Carlos, the favorite of the absolutists, appointed his successor. This excited the hatred of the nation; and Ferdinand recovering, abolished the law. To avoid imprisonment, C. fled to France. He died at Toulouse in 1842.

CALOMEL is the popular name given to one of the compounds of mercury, Hg, and chlorine, Cl, and known to scientific chemists as the subchloride of mercury, Hg_2Cl_2 . It is prepared by taking two equal portions of mercury, dissolving one portion in hot concentrated sulphuric acid, H_2SO_4 , which forms sulphate of mercury, HgSO_4 , thereafter adding the second part of the metal, and triturating the whole in a mortar till the metal becomes incorporated with the sulphate of mercury. This mixture is then added to one half its weight of common salt, NaCl, and heated in a retort, when C. sublimates, and condenses in the cool part of the receiver, as a fine white powder. A minute portion of corrosive sublimate which accompanies it, is removed by washing with water. C. is very dense. It is not soluble in water, and sparingly so in acids. It turns black on the addition of lime-water, potash, soda, or ammonia; and when heated in an iron spoon, or on a knife, it does not char, but rises in vapor, sublimates unaltered, and readily condenses again on any cool surface held near it. Although C. has been more used in general practice than any other preparation of mercury, it is not known to have been employed before the 17th century. Its medicinal virtues will be treated of with the other mercurials. See MERCURY.

CALONNE, CHARLES ALEXANDRE DE, controller general of finance in France under Louis XVI., was b. Jan. 20, 1734, at Douay. Possessing superior abilities, he studied law, and having filled successively various offices, was made, in 1783, controller general of the treasury. In this capacity he soon gained favor among the courtiers, who had complained of the parsimony of Turgot and Necker. C., though he found French finance in a deplorable state, was determined not to seem poor, gave brilliant entertainments, paid off the debts of his patron the count of Artois, supplied the queen with sufficient pocket-money, granted pensions and gratuities to his supporters and favorites, paid off arrears, and purchased the residences of St. Cloud and Rambouillet! His means of raising money were perfectly simple—he borrowed, anticipated, issued chancery-edicts, and prolonged and augmented extraordinary taxations in a style never known before. The parliament resisted these measures, but C., backed by royal authority, carried them into execution. The crisis necessarily arrived; and in 1786, when the people could bear the extraordinary taxation no longer, C. advised the king to convoke the assembly of the notables, and proposed to abolish the privileges (exemption from taxes) of the noble and wealthy, to take the duty off salt, to abolish *socage* (feudal or compulsory service to the lord of the manor), and to distribute the burden of taxation more equally. The people and the aristocracy demanded a convocation of the states-general, instead of the assembly of the notables; but C. boldly proceeded with his plan, opened the assembly of the notables, Feb. 2, 1787, and in a pleasant and florid oration, described the general prosperity of French industry and commerce and brought his speech to a climax by confessing that the annual deficit of the treasury had risen to 115 millions of francs, and that during the time from 1776 to 1786, the government had borrowed no less a sum than about 1250 millions! The notables, instead of proceeding with C.'s plan of reorganization, demanded from him a statement of accounts. Not being able to give this satisfactorily, he was stripped of his dignities, and banished to Lorraine. After this, C. resided chiefly in England, until in 1802 he obtained from Bonaparte permission to return to France, where he died, in very embarrassed circumstances, Oct. 30, 1802.

CALOPHYLLUM (Gr. beautiful leaf), a genus of trees of the natural order *guttifera* (q.v.), natives of warm climates. Some of the species yield valuable timber, as *C. angustifolium*, the PINEY TREE, which grows at Penang, and in the islands to the eastward of the bay of Bengal, and furnishes the beautiful straight spars called *peon*. The resinous products of some species are valuable, and among them are some of the substances known by the name of *tacamahaca* (q.v.). *C. inophyllum*, which yields true East Indian *tacamahaca*, is a very large and beautiful umbrageous tree, often planted for its shade and the fragrance of its flowers, which are white and in loose axillary racemes. It is one of the most valuable timber-trees of the South Sea islands. The timber resembles mahogany, being of equally close texture, although of lighter color, and very durable. The leaves are oblong and obtuse; the fruit—which in all this genus is a globose drupe or stone fruit—is about the size of a walnut; and a fixed oil is expressed from its kernel, which is used for lamps, etc. A similar oil is expressed from the seed of *C. calaba*, the CALABA TREE of the West Indies, which also has white sweet-scented flowers, and of which the timber is used for various purposes, particularly for staves and cask-headings.

CALO'RIC, a term for heat (q.v.).

CALORIC ENGINE. This was the name given by Capt. Ericsson to his latest *air-engine*. There seems no reason for the change of name, unless it were meant to distinguish it from the previously well-known, though hitherto unsuccessful air-engines of the Messrs. Stirling. We shall in this article treat air and caloric engine as synonymous terms.

It is a well-known law, applicable to all thermo-dynamic engines, that (presupposing

the merely mechanical part of the machine to be perfect) the heat converted into work bears the same proportion to the total heat given to the fluid that the range of temperature bears to the highest *absolute* temperature of the fluid. Thus supposing an engine to receive steam* at the temperature of 275° F., and discharge it at that of 120° F., the fraction of heat which it can convert into work will be $\frac{275-120}{275+461}$ or about 21 per cent

of the total heat of the fluid. This proportion would be, of course, greatly reduced in practice, owing to imperfections in the machinery, but these being equally likely to occur in all prime movers, we need not consider them here. The *lowest* limit of temperature available being practically constant, fixed either by the temperature of the atmosphere, or that obtainable in a condenser, it follows that greater economy can only be looked for in the direction of increase of initial temperature. In ordinary steam-engines, in which the pressure and temperature increase simultaneously, the latter is limited by the former, which in its turn is kept, by considerations of safety, comparatively low. When, however, *superheated* steam (steam to which additional heat has been imparted without the corresponding addition of pressure) or heated air is used, the temperature is limited only by the power of the metals composing the machine to resist the destructive action of heat, or the chemical action of the fluid at that temperature. Heated air possesses the advantage over superheated steam as a motive power, that with it an explosion, in the usual sense of the word, is rendered almost impossible, and that, if one were to occur, it would be comparatively harmless. It also, of course, enables the boiler to be dispensed with.

Air-engines, in their principal working parts, are very similar to ordinary steam-engines. The heated air is introduced into a cylinder, in which works a tightly-fitting piston, which is thus compelled to move up and down, and transfers its motion to a revolving shaft by means of a piston and connecting-rod in the usual manner. The motion of the piston results in all cases from the expansion of the heated air; the air is heated by means of a furnace, is introduced below the piston, raises it, and then is allowed to escape into the atmosphere. Air-engines are almost invariably single-acting; they are sometimes worked simply by heated air, and sometimes with the air which, having passed through the furnace, is mixed with all the gaseous products of combustion. The latter method has the immense advantage that it utilizes the heat which would otherwise be rejected into the chimney. The total efficiency of the machine is thus increased, although the efficiency of the engine proper, between the given pair of temperatures, remains the same.

The more heat carried away by the discharged air—the higher its temperature, in other words—the smaller evidently is, *ceteris paribus*, the range of temperature of the machine, and the less, therefore (as already explained), will be its efficiency. The distinctive principle of the Messrs. Stirling's air engine, as of the later C. E., consists in utilizing a great part of this wasted heat, and thus economizing fuel. This is effected by means of a "regenerator," or, more properly, "economizer," consisting of a chamber filled with metallic sieves of wire-gauze, through which the hot air is made to pass *outwards* from the cylinder, after having performed its work on the working piston of the engine. As much of the heat of the escaping air is taken up by the regenerator, and its temperature thus reduced, the range of temperature of the machine is correspondingly increased. The fresh air entering the cylinder for the next stroke was compelled to pass *inwards* through the regenerator, and abstracted from it the heat left in it. In this way it did not require to receive so much heat in the furnace as would otherwise have been the case, and thus economized fuel.

This method of preventing waste of heat was first discovered by the Rev. Dr. Stirling, who obtained a patent for it in 1816. In working with air at the ordinary pressure of the atmosphere, however, the engine was found to require to be of large dimensions as compared to a steam-engine of the same power; and in order to obviate this objection, compressed air was used, the idea originating with Mr. James Stirling, C.E. Several other difficulties were successfully surmounted by the Messrs. Stirling, and eventually two improved engines were constructed, one of which was tested to fully 40 horsepower. This latter engine did all the work of the Dundee foundry company regularly for upwards of 3 years, during which period they employed no other motor. At the end of this period it was laid aside, principally owing to the repeated failure of one of the heating vessels.

Capt. Ericsson, in his attempt to introduce his C. E. in the ship which bore his name, experienced precisely the same difficulties and disappointments, and tried nearly the same remedies as the Messrs. Stirling. There seems little doubt, however, that he actually believed his "regenerator" was to make the *same* heat do work over and over again—to be a kind of perpetual motion—and under these circumstances it is not to be wondered at that his machines (notwithstanding some not very creditable maneuvering on the part of their upholders) entirely failed, and that in 2 years (1855) they were replaced by steam-engines.

Air engines have recently been constructed, in which the solar rays, concentrated by

* The law is the same for steam, air, or any other fluid whatever.

means of an arrangement of mirrors, are utilized as the source of heat. These have been called *solar engines*.

CALORIMETER, a measurer of the degree of heat (q. v.).

CALORIMOTOR, a powerful galvanic battery devised by Dr. Hare. He placed a sheet of non-conducting substance, as paste-board, between a sheet of copper and another of zinc, rolled the whole together, and plunged the bundle into a barrel of acidulated water. As there was but one pair of plates, the intensity of the electricity produced was feeble, but because of the great surface, the quantity was large; effects which depend upon quantity, as heat, were produced in an intense degree. The same result is now attained by coupling the elements of many small cells in such a way that all the positive plates shall be united in one, and the negative plates in another.

CALOTROPIS. See MUDAR.

CALOTTISTES (*Le Régiment de la Calotte*), a society of witty and satirical men, in the time of Louis XIV., who were headed by two officers in the king's body-guard, named Torsac and Aimon. Their name was taken from the word *calotte* (a "small cap," worn by monks over the tonsure), and their amusement consisted in sending to any public character who had exposed himself to ridicule, a "patent," authorizing him to wear the *calotte* as a covering for the weak part of his head. The armorial bearings of the *Régiment de la Calotte* consisted of various symbols of folly, with the motto, "*C'est régner que de savoir rire*." When Torsac, its first "generalissimo," died, the society, which occupied a position of satirical hostility to the French academy, drew up a burlesque funeral oration, manufactured out of the pompously eulogistic phrases that the academicians were in the habit of using. As the society became audacious, and did not spare even royalty itself, it was dissolved by the minister Fleury. The *Mémoires pour servir à l'Histoire de la Calotte* (Basel, 1725) is an amusing little book. During the restoration, the title *Régime de la Calotte* was applied to the priestly administration of affairs.

CALOTYPE PROCESS (Gr. *kalos*, beautiful, *typos*, impression), a title comprehending a variety of methods for the production of negative photographs on paper; and so named by the inventor, the late Dr. H. Fox Talbot, who exhibited the result of his experiments in the year 1840. The principle involved in the C. P. depends on the susceptibility to the action of daylight of a surface chemically prepared, and the practice consists in the preparation, and exposure in the camera, of a sheet of paper, having on one surface an even and finely divided layer of iodide of silver, nitrate of silver, and an organic acid; the image obtained on this surface being subsequently developed with gallo-nitrate of silver. It will be unnecessary here to describe the various modifications which have been introduced with the object of imparting a high degree of sensibility to the paper; one process—the best—will suffice to describe the manipulation.

Good plain paper, sized with gelatine, should be chosen, the foreign starch-sized papers being unsuitable, on account of the solutions sinking in too deeply, and thus impairing that sharpness of outline which should be possessed by a good negative. The paper is then floated on one side, and for a moment only, on a solution of iodide of silver in iodide of potassium; prepared by adding freshly precipitated iodide of silver to a strong solution of iodide of potassium. It is then dried, and plunged into a dish containing distilled water, which, by removing the soluble iodide of potassium, precipitates the iodide of silver in an even and finely divided condition over the whole surface of the paper, which in this state will keep good for twelve months. It is now ready to receive the *sensitive coating*; this operation, which is called *exciting* the paper, is performed in the following manner: Two solutions are prepared—one, a saturated solution of gallic acid in cold distilled water, called solution A; the other, a solution of 50 grains of nitrate of silver in 1 oz. of distilled water, to which 1 dram of glacial acetic acid has been added; this is called solution B. The iodized paper obtained as above is now laid on a board having a piece of clean blotting-paper on it a little larger than the paper to be excited, and the following solution brushed over it with a clean Buckle's brush: distilled water, 1 oz.; solution A, 15 drops; solution B, 15 drops. This mixture, prepared in a chemically clean glass vessel, should be freely applied, and the excess absorbed by clean blotting-paper. The paper is now ready for exposure in the camera, and may be at once placed in the dark slide; or a stock may be thus sensitized and preserved between folds of blotting-paper until required for use. The *time of exposure*—varying from three minutes to a quarter of an hour—is determined by the diameter and focal length of the lens employed, the aperture of the diaphragm or stop, and the amount of light prevailing at the time. The *development of the latent image*, an operation which, like the preceding, is, of course, conducted in a room illuminated only by yellow light, is accomplished by applying freely and uniformly over the whole surface solution A; and when the image begins to appear, applying a second quantity, to which a few drops of solution B have been previously added, to increase the intensity. The whole operation of development occupies about a quarter of an hour; and when the details are fully out, the picture should be washed with water, and *fixed*, by immersion in a solution of 1 part of hyposulphite of soda to 4 parts of water; it is then again freely washed in frequent changes of water during several hours; it is lastly *dried* and *vaxed*; when it may be regarded as a finished negative, from which positive prints may be obtained, having the lights and shadows as in nature. See POSITIVE PRINTING.

CALOVIVS, ABRAHAM, 1612-86; a Lutheran minister, rector at Dantzic, and professor at Königsberg and Wittenberg. He was a strong controversialist, a vigorous supporter of his sect, and author of *Systema locorum theologicorum* (1665-77).

CALOYERS, a general name for the monks of the Greek church. The name is a corruption of two Greek words, *kalos* and *geron*, and signifies "good old men." The C. follow the order of St. Basil, and are divided into three ranks: the novices, called *archari*; the ordinary professed, called *microchemi*; and the more perfect, called *megalochemi*. It is always from among them that bishops and patriarchs are chosen, because they are generally members of the most distinguished families of the upper and middle classes. The C. also furnish the only learned theologians in Greece at the present day. Their monasteries are very numerous. The most celebrated in Asia is that of Mt. Sinai, founded by the emperor Justinian, and endowed with a revenue of 60,000 crowns. In Europe, Mt. Athos alone has twenty, the inmates of which have so great a reputation for sanctity, that even the Turks seek an interest in their prayers. The C. are obliged to labor for the benefit of their monastery as long as they continue in it. Their religious services occupy an unnaturally large portion of their time, beginning at midnight and continuing at intervals until sunset. They observe four Lents: the first, of eight weeks, in commemoration of the resurrection of our Lord; the second, of three weeks, in honor of the holy apostles; the third, of fourteen days, in commemoration of the assumption of the Virgin; and the fourth, in commemoration of the advent.—There are also female C., or Greek nuns, who likewise follow the rule of St. Basil.

CALPE. See HERCULES, PILLARS OF.

CALPEE, a city of Jhansi, one of the n.w. provinces of India, on the right bank of the Jumna, in lat. 26° 7' n., and long. 79° 48' east. Pop. '91, 12,700. It is an entrepôt for the cotton of the neighboring district. It has manufactures of cotton and paper, and is celebrated for the beauty of its refined sugar. It became British by capture and cession, respectively, in 1803 and 1806. It is 51 m. s.w. of Cawnpore, and is closely linked with it in the history of the insurrection of 1857-58, as the head-quarters of the Gwalior contingent.

CALPENTYN', a long and narrow peninsula on the w. side of Ceylon, in lat. 8° 14' n., and long. 79° 53' east. The neck is so low as to be overflowed during the n.e. monsoon, so that it is transformed into an island.

CALPURNIUS. The Calpurnia gens was, by its own account, one of the oldest plebeian clans in Rome; but it does not figure in history till the time of the first Punic war. The family names, in the time of the republic, were Bestia, Bibulus, Flamma, and Piso.—MARCUS CALPURNIUS BIBULUS is known as the hostile but incapable colleague of Cæsar (q.v.) in the consulate. He was put up by the aristocratic party, who spent vast sums to carry the election. He finally joined the Pompeian party, had command of the fleet intended to prevent Cæsar's passage to Greece, and died 48 B.C., before the battle of Dyrrhachium. Among the Roman women of this family, two are celebrated—CALPURNIA, the daughter of Calpurnius Piso (consul 58 B.C.), and the last wife of Cæsar, who seems, from the scanty notices of her we possess, to have been a quiet domestic woman, full of love and solicitude for her great husband; and CALPURNIA, the daughter of L. Calpurnius Bestia, wife of P. Antistius, who killed herself when her husband was murdered by order of the younger Marius, 82 B.C.

CALPURNIUS, TITUS JULIUS, surnamed SICULUS, a pastoral poet who lived in Sicily about the end of the 3d century. He seems to have been an imitator of Virgil, but beyond his complaining of poverty nothing is known of his personal history.

CALTABELLO TA (a Saracenic name = "the castle of the cork-trees"), a t. of Sicily, Girgenti, 7 m. n.e. of Sciacca, most picturesquely situated around an ancient castle, which crowns a steep rock overhanging a stream (anc. *Crimisus*), of the same name as the town. Of its churches the *Chiesa Matrice* is a beautiful relic of the middle ages, resembling a mosque, with a single row of columns down the middle. C. was captured by the Saracens in 840 A.D. Pop. about 6,200.

CALTANISSETTA, a province in Sicily, s. of Palermo; 1,263 sq. m.; pop. '95, 325,591. The soil is fertile, producing grapes, olives, almonds, hemp, cotton, etc. Marble, agate, alabaster, sulphur, and iron ore are found. Agriculture is the chief industry, but there are foundries and manufactories of chemicals.

CALTANISSETTA, a fortified t. of Sicily, situated on a fertile plain near the Salso, about 28 m. n.e. of Girgenti. It has mineral springs and extensive sulphur-works. Pop. '94, 35,500.

CALTAVUTURO, a t. of Sicily, province of Palermo, and 37 m. s.e. of the city of that name, on a small river, the Grande. The town is of Saracenic origin. Jasper is found near C. Pop. about 5,600.

CALTHA. See MARSH MARIGOLD.

CALTONICA, a t. of Sicily, about 15 m. n.w. of Girgenti. It has pretty extensive sulphur-works and salt-works. Pop. 7,000.

CALTROP, CALTHROP, or CALTHORP, in military warfare, is a four-pronged piece of iron, each prong about four in. in length. When it is wished to check the approach of

the enemy's cavalry over a plain, or of his besiegers in the ditch of a fortification, caltrops are sometimes thrown down; from their shape, one prong is sure to stand upright, and may work terrible mischief. See *illus.*, **FORTIFICATION**, vol. VI.

CALUIRE, a t. of France, in the department of the Rhone, situated on the left bank of the Saone, about 3 m. n.e. of Lyon. It has three annual fairs. Pop. '91, 7600.

CALUMBA, or **COLOMBO**, very extensively used in medicine, is the root of *cocculus palmatus*, a herbaceous plant of the natural order *menispermaceæ* (q.v.). It is said to derive its name from Colombo in Ceylon, although the C. now chiefly in use is the produce of Mozambique. The flowers in this genus have 12 sepals and petals in all, similar in appearance, and disposed in four rows. The male and female flowers are on separate plants. *C. palmatus* has nearly circular leaves with 5 to 7 lobes, on long hairy foot-stalks, and solitary axillary racemes of small green flowers, the racemes of the male plants branching. The fruit is a drupe, or 1-seeded berry-like fruit, about the size of a hazel-nut, densely clothed with long hairs. The stem is annual and twining; the root perennial, consisting of clustered spindle-shaped fleshy tubers, with a brown warty epidermis, and internally deep yellow. The plant is not cultivated: the root is collected where it grows wild in dense forests. It is dug up in Mar., cut into slices or short cylindrical pieces, and dried in the shade. In this state it appears in commerce, having a greenish-yellow tint, a very bitter taste, and a faint aromatic odor. Its bitterness is ascribed to a somewhat narcotic principle called calumbine, and to *berberine*, an alkaloid originally discovered in the barberry (q.v.), which is also present in it. C. is regarded as one of the most useful stomachics and tonics. It is demulcent, not at all stimulant, and capable of being employed in cases in which almost every other tonic would be rejected by the stomach. It is sometimes given to allay vomiting. It has been found very useful in diarrhea and dysentery. It is administered in the form of powder, infusion, or tincture. Similar properties seem to reside in the roots of the species of *cocculus* generally.—The very poisonous seed known by the name of *cocculus Indicus* (q.v.), belongs to a plant of a different but allied genus.—The root of *fraxera walteri* is sometimes fraudulently substituted for C., and has been called American calumba root. It does not agree with C. in its properties, but, besides its very different appearance, it may be distinguished by its undergoing no such change of color when touched with tincture of iodine, as in true C. root is produced by the presence of starch. See **FRASERA**.

CALUMET, the "peace-pipe" of the North American Indians, is a tobacco-pipe having a stem of reed about two feet and a half long, decorated with locks of women's hair and feathers, and a large bowl of polished marble. It plays an important part in the conclusion of treaties, of which, indeed, it may be described as the ratifier. After a treaty has been signed, the Indians fill the C. with the best tobacco, and present it to the representatives of the party with whom they have been entering into alliance, themselves smoking out of it afterwards. The presentation of it to strangers is a mark of hospitality, and to refuse it would be considered an act of hostility.

CALUMET, a co. in e. Wisconsin, on Winnebago lake; 340 sq.m.; pop. '90, 16,639. It is a hilly region, but with abundance of timber and good pasturage, and produces grain, hay, hops, wool, etc. Co. seat, Chilton.

CALUMET, a town and village in Houghton co., Mich., on the Hancock and Calumet railroad, and in the heart of the copper district of the state. It is situated 42 miles north of L'Anse by rail, and has excellent connections with the rest of the peninsula. Here is situated the famous Calumet and Hecla copper-mine, which is said to be the richest in the world. (See **COPPER**; **MICHIGAN**.) The town has manufactories, banking facilities, newspapers, and churches. Pop. 1890, town, 12,529; village, 1159.

CALUMNY. An ancient regulation of the Scotch law obliged litigants to give their oath of C.—that is, they swore, either by themselves or by their counsel, that the facts alleged by them were true, although in practice this oath was not usually put unless one of the parties required it of his adversary. In the modern practice, however, of the court of session, this oath is confined to actions for divorce, and other consistorial cases.

CALUMNY, **LAW AS TO**. See **LIBEL**.

CALUSO, a t. of n. Italy, in Piedmont, province of Turin, about 11 m. s. of Ivrea, and connected with Turin by railway. Pop. 6000.

CALVADOS, a maritime department in the n.w. of France, bounded n. by the English channel, and e., w., and s. by the departments of Eure, Manche, and Orne. It is formed out of a part of the old province of Normandy. The principal rivers are the Touques, Orne, Dives, Seulle, Dromme, and Vire. The coast, which has few bays or inlets, is partly formed by bold ridges, and partly by sand-downs, cliffs, and reefs. The reef extending between the mouths of the Orne and the Vire, called Calvados, after one of the vessels in the Spanish armada shipwrecked here, and from which the department takes its name, is very dangerous to navigation. The soil of the department is generally fertile, especially in the valleys, supplying rich pasturage for horned cattle, sheep, horses, and swine, which constitute the principal wealth of Calvados. The climate is healthy, though changeable. Iron, marble, slate, and coal are found. There are various manufactures, and the coast-fisheries are of some importance. C. has an area of 2132

sq.m., with a pop. in 1896 of 417,176, and is divided into six arrondissements. Caen is the capital.

CALVAERT, DIONYS, called also DIONISIO FLAMMINGO, a distinguished painter, especially in landscape, was b. at Antwerp in 1555. He settled early at Bologna, where he opened a school, and had among his students the celebrated Domenichino, Guido, and Albani, who were, afterwards, however, pupils of the Caracci. Many excellent pictures by him are still preserved at Bologna. He died in 1619.

CALVARY, MOUNT, the scene of our Saviour's crucifixion, is an eminence which lay at the n.w., and just on the outside, of the ancient city of Jerusalem. Calvary, or Calvaria, is a translation into Latin of the Hebrew word Golgotha, signifying a "skull," either because the mount was a place of public execution, or because it was shaped like a human skull.

CALVARY, in Roman Catholic countries, is a representation of the various scenes of the passion and crucifixion of our Lord, either in a chapel, or external to the church, as at St. Jacques at Antwerp. It consists of three crosses with the figures of Christ and the thieves, usually as large as life, surrounded by a number of figures, representing the various personages who took part in the crucifixion. At Aix-la-Chapelle, the C. is a church on the top of a hill, surrounded by twelve sculptured stones, each marking an event which took place on the journey of the Saviour to Mount Calvary. The approach to the C. is called the *Via Dolorosa*, each of the stones marking what is called a station, at which the pious say a prayer in passing.

CALVELLO, a t. in the province of Basilicata, Italy, pleasantly situated on a hill-slope about 13 m. s. of Potenza. It has two convents. Pop. about 5000.

CALVENTURA ISLANDS, off the coast of Arracan, in the bay of Bengal, their center being in lat. 16° 53' n., and long. 94° 20' east. The group consists of two divisions—one to the s.e., which is composed of two lofty and well-wooded islets; and another to the n.w., which presents seven bare rocks, chiefly of fantastic shapes.

CALVERT, a co. in Maryland, on Chesapeake bay; 218 sq.m.; pop. '90, 9860, includ. colored. Its surface is rolling, with good soil, having marl in abundance. The chief productions are tobacco, corn, and oats. Co. seat, Prince Fredericktown.

CALVERT, GEORGE AND CECIL. See BALTIMORE, LORD.

CALVERT, GEORGE HENRY, b. Baltimore, 1803; a graduate of Harvard, and for a long time editor of the *Baltimore American*. In 1832, he published *Illustrations of Phrenology*, the first treatise on the subject issued in this country. Among his works are a *Metrical Version of Schiller's Don Carlos*; *Scenes and Thoughts in Europe*; *Cabiro*, a Don Juanic poem; *An Introduction to the Social Sciences*; *The Gentleman*; *Aynta and Other Poems*; *First Year in Europe*; *Ellen, a Poem*; and *Goethe, his Life and Works*. In 1843, he removed to Newport, R. I., of which city he was chosen mayor in 1853. He d. 1889.

CALVERT, LEONARD, abt. 1606-47; brother of the second lord Baltimore, and first governor of Maryland. In 1633, he led the first expedition to Maryland in two small vessels, and on the 25th of Mar., 1634, at St. Clement's island on the Potomac, a regular mass was celebrated. Immediately afterwards they settled on the right bank of a river called by them St. George, and founded the prospective city of St. Mary, few signs of which now remain. After much difficulty with the people of Virginia the colonists under Calvert were fully established, and in 1647 his name as governor of the province was recognized.

CAL VI, a seaport on the island of Corsica, situated on a peninsula in the gulf of Calvi, about 38 m. w.s.w. of Bastia, lat. 42° 35' n., long. 8° 43' east. It is strongly fortified, and has a good port, with a high light at its entrance, and a considerable export trade. C. was captured by the English in 1794, after a siege of 51 days. Pop. about 3000.

CALVILLE, a kind of apple, of which there are numerous sub-varieties. The calvilles diminish in thickness from the middle towards the calyx, where they form a point; they have regular ribs and a large open seed-chamber; also a pleasant smell, and are unctuous to the touch. They are never altogether streaked; they have a fine loose flesh, with a flavor somewhat resembling that of the raspberry or strawberry. The white winter C. is in high repute both as a culinary and dessert apple; it is very extensively cultivated on the continent of Europe.

CALVIN, JOHN, one of the most eminent of the reformers of the 16th c., was b. at Noyon, in Picardy, on the 10th of July, 1509. His father, Gerard Cauvin or Calvin, was procureur-fiscal of the district of Noyon, and secretary of the diocese. He was one of six children—four sons and two daughters. All the three sons who survived were bred ecclesiastics; and the reformer himself, while still only 12 years of age, was appointed to a chaplaincy in the cathedral church of Noyon. This he held as a means of support during the period of his education, and even for some short time after he had entered on his reforming career. C. was educated in circumstances of ease, and even affluence. The noble family of Mommor, in the neighborhood, invited him to share in the studies of their children; he was in some measure adopted by them, and when the family went to Paris, in his 14th year, he accompanied them, and participated in the benefits of the higher instruction which was there attainable. He was entered as a pupil in the Collège

de la Marche, under the regency of Mathurin Cordier, better remembered, perhaps, by his Latin name of Corderius. It was under this distinguished master that C. laid the foundation of his own wonderful mastery of the Latin language. During this early period, he was distinguished by the great activity of his mental powers, and the grave severity of his manners. His companions, it is said, surnamed him the "Accusative."

For awhile, his attention was directed to the study of law. His remarkable talents seemed to promise great success in this branch of study, and his father sent him, with the view of prosecuting it, to the university of Orleans, then adorned by Pierre de l'Etoile, one of the most famous jurists of his day, and afterwards president of the parliament of Paris. At Orleans, he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. Beza says that, after supping moderately, he would spend half the night in study, and devote the morning to meditation on what he had acquired. His undue habits of study seem to have laid thus early the foundation of the ill-health which marked his later years. It was while a law-student in Orleans that he became acquainted with the Scriptures, and received his first impulse to the theological studies which have made his name so distinguished. A relative of his own, Pierre Robert Olivetan, was there engaged in a translation of the Scriptures; and this had the effect of drawing C.'s attention, and awakening within him the religious instinct which was soon to prove the master-principle of his life. We cannot say as yet that his traditionary opinions were unfixed, or that he had embraced with any decision the Protestant opinions that were spreading everywhere; but the seeds of the new faith were now beyond doubt sown in his heart, and from this time, although he still continued for awhile longer to pursue his legal studies, his main interests appear to have been religious and theological. From Orleans he went to Bourges, where he acquired the knowledge of Greek, under the tuition of a learned German, Melchior Wolmar, to the influence of whose spiritual instructions he was also greatly indebted. He began here to preach the reformed doctrines, and passed over into the ranks of Protestantism, under the slow but sure growth of his new convictions, rather than under the agitation of any violent feeling. Here, as everywhere, his life presents a marked contrast to that of Luther.

He proceeded to Paris in 1533, which at this date had become a center of the "new learning," under the teaching of Lefevre and Farel, and the influence of the queen of Navarre, sister of Francis I. The Sorbonne itself had not escaped the infection. There was a growing religious excitement in the university, in the court, and even among the bishops. This, however, was not to last. The king was soon stirred up to take active measures to quell this rising spirit; and the result was that C. and others were obliged to flee for their lives. The story is that C. narrowly escaped, having descended from his window by means of his sheets, and fled, under the guise of a vine-dresser, a friend of his, in whose clothes he concealed himself. After this he repaired for a short time to his native place, resigned the preferment he held in the Roman Catholic church, and for a year or two led a wandering life, sheltered in various places. We find him at Saintonge; at Nerac, the residence of the queen of Navarre; at Angoulême, with his friend Louis Tillet; then for a brief while at Paris again, strangely enough expecting a meeting with Servetus, who had expressed a desire to see and confer with him. Persecution against the Protestants at this time raged so hotly, that C. was no longer safe in France; and he betook himself to Basel, where he is supposed to have prepared the first edition of the *Institutes of the Christian Religion*, and whence he certainly issued, in the year 1535, the famous preface addressed to Francis I. The concentrated vigor of this address, its intensity of feeling, rising into indignant remonstrance, and at times a pathetic and powerful eloquence, make it one of the most memorable documents in connection with the reformation. It is throughout a noble defense of the righteous character of the reformed doctrines, and their support alike in Scripture and in history. The energetic decisiveness and moral zeal of the future teacher and legislator of Geneva, speak in every page of it. After completing this great service to the cause of Protestantism, he made a short visit to Italy, to Renée, the duchess of Ferrara. Finally, he revisited his native town; sold the paternal estate, which had devolved to him on the death of his eldest brother; and bidding it adieu, set out in company with his younger brother and sister on his way to Strasburg. The direct road being rendered dangerous by the armies of Charles V., which had penetrated into France, he sought a circuitous route through Savoy and Geneva.

The result of this journey was memorable for the cause of the reformation. Arrived in Geneva, he met there his friend, Louis Tillet, who communicated the fact of his arrival to Farel, then in the very midst of his struggle to promote the reformation in the city and neighborhood. Farel hastened to see him, and urge upon him the duty of remaining where he was, and undertaking his share of the work of God, under the burden of which he was like to fail. C. did not at first respond to the call. He was given, he himself says, to his "own intense thoughts and private studies." He wished to devote himself to the service of the reformed churches generally, rather than to the care of any particular church. A life of intellectual and theological labor was that which at that time was most congenial to him. By some strange insight, however, Farel penetrated to the higher fitness of the young stranger who stood before him, and he ventured, in the spirit of that daring enthusiasm which characterized him, to lay the curse of God

upon him and his studies if he refused his aid to the church of Geneva in her time of need. This seemed to C. a divine menace. "It was," he said, "as if God had seized me by his awful hand from heaven." He abandoned his intention of pursuing his journey, and joined eagerly with Farel in the work of reformation.

Such was the beginning of C.'s great career in Geneva. Having entered upon his task, he soon infused an energy into it which crowned the struggling efforts of Farel with success. The hierarchical authority was already overturned before his arrival; the citizens had asserted their independence against the duke of Savoy, whose alliance with the corrupt episcopate, which was the direct governing influence in the place had called forth the patriotic as well as the religious feelings of the people. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant confession of faith was drawn out, approved of by the council of two hundred, the largest governing board of the city, and then proclaimed in the cathedral church of St. Peter's as binding upon the whole body of the citizens. Great and marvelous changes were wrought in a short time upon the manners of the people; where license and frivolity had reigned, a strict moral severity began to characterize the whole aspect of society. The strain, however, was too sudden and too extreme. A spirit of rebellion to the rule of C. and Farel broke forth; they refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves, and known in the history of Geneva under the nickname of Libertines; and the consequence was, that they were both expelled from the city after less than two years' residence.

C. retreated to Strasburg, where he had meant to go when arrested in his course at Geneva. Here he settled, and devoted himself to theological study, and especially to his critical labors on the New Testament. Here, also, in Oct., 1539, he married the widow of a converted Anabaptist. The marriage appears to have proved a happy one, although not of long duration.

The Genevans found, after a short time, that they could not well get on without Calvin. His rule might be rigid; but an authority, even such as his, which might gall from its severity, was better than no settled authority at all; and the libertine party seem to have been unable to construct any efficient and beneficent form of government. Accordingly, they invited C. to return; and after some delay on his part, in order to test the spirit in which they were acting, he acceded to their invitation, and in the autumn of 1541, after three years' absence, once more made his entry into Geneva.

Now, at length, he succeeded in establishing his plan of church-government, in all its forms and details. By his college of pastors and doctors, and his consistorial court of discipline, he founded a theocracy, with himself at the head of it, which aimed virtually to direct all the affairs of the city, and to control and modify both the social and individual life of the citizens. Not without a struggle, it may be supposed, did he succeed in his great autocratic scheme. The libertines, although dishonored by their ineffectual attempts to maintain order in the city, and uphold its rights and dignity, still remained a strong party, which was even augmented, after C.'s return, by men such as Amy Perrin, who had strongly concurred in the invitation to C., but who were afterwards alienated from him by the high and arbitrary hand with which he pursued his designs, as well as by their own schemes of ambition. The struggle with this party lasted with various fortune for no less a period than 15 years, and was only terminated in 1555, after a somewhat ridiculous *émeute* in the streets. Amy Perrin and others, driven from the city, were executed in effigy; and the reformer's authority from this date confirmed into an absolute supremacy.

During the period of this long struggle with the libertines, C. had many other disputes, in which he conducted himself with no less heartiness and zeal. The most remarkable of these were his controversies with Sebastian Castellio, Jerome Bolsec, and above all, Michael Servetus.

C. had become acquainted with Castellio at Strasburg. They entertained at first a warm friendship for each other, and C. showed great zeal in assisting Castellio, whose poverty and learning had attracted his sympathy. When he returned to Geneva, he invited Castellio to join him there, and procured for him the title of regent or tutor in the gymnasium of the city. There was little similarity, however, in the characters of the two men, and the diversity of their tastes and views soon became apparent. The learning of Castellio was intensely humanistic; a classical spirit and a somewhat arbitrary opinionativeness molded all his studies; and as soon as he began to apply himself to theology, he came into conflict with Calvin. In a letter to Farel in 1542, we find C. speaking of the freaks of "our friend Sebastian, which may both raise your bile and your laughter at the same time." These freaks relate to Castellio's notions of scriptural translation, and his refusal of C.'s offer to revise the version which he had made of certain parts of Scripture. Then, two years later, when Castellio desired to enter into the ministry, C. dissuaded the council from accepting him, on account of some peculiar opinions which he held. These were certain rationalistic views as to the authenticity and character of the Song of Solomon, the descent of Christ into hell, and also about election. After this, Castellio left Geneva for awhile, but soon returning, he attacked the views of C. openly. After a violent scene in church, which is painted in C.'s letters very strongly, he was forced to leave the city. The two old friends, now declared enemies, did not spare each other henceforth. The fate of Servetus drew forth an anonymous publication, attacking

with keen logic and covert and ingenious sarcasm the Genevan doctrines. This publication was attributed by both C. and Beza to Castellio, and they replied to him in no measured terms, stigmatizing him as a "deceiver and vessel of Satan." One fact really disgraceful to C. in the controversy deserves not to be passed over. Sunk in great poverty, Castellio was obliged, in his old age, to gather sticks on the banks of the Rhine at Basel, as a means of support. C. did not hesitate to accuse him of stealing the sticks. Such polemical truculence may well make us turn away in disgust and indignation.

The controversy with Bolsec belongs to a later period. Jerome Bolsec was originally a Carmelite monk, but he had thrown aside the habit, and betaken himself to the practice of medicine in Geneva. He was led to attack C.'s doctrine of predestination. As soon as C. heard of this, he led him to understand that he was not at liberty to question the Genevan doctrine. He and the other clergy dealt with him; but after repeated disputations Bolsec was found incorrigible, and was sentenced to banishment from the city. Cast out of the theocratic community, he ultimately re-joined the Roman Catholic church, and revenged himself in a somewhat mean way against C. by writing his life in a spirit of detraction and slander.

Of all these contests, however, the most memorable is that with Servetus. A melancholy interest encircles the name of this great heretic, which the criminal tragedy of his death keeps always fresh and vivid in the minds of all who hate intolerance, and who love truth rather than dogmatism. The character of Servetus himself has little to do with this interest. He seems to have been more of a vain, restless, and enthusiastic dreamer, than of a calm and patient inquirer. In his very dreams, however, and the vague audacities of his speculation, there is a kind of simplicity and unconscious earnestness that wins sympathy. He had entered into various connections with C., even from the time of his early residence in Paris; particularly, he had sent him various documents containing the views, fully developed in his work subsequently published under the title of *Restitutio Christianismi*. C. never concealed his abhorrence of these views; and in a letter to Farel as early as 1546, he threatens that if Servetus should come to Geneva, he would do what he could to bring him to condign punishment: *Nam si venerit, modo valeat mea auctoritas, vivum exire nunquam patiar*. The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of C.'s share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that C. was the instigator, through a creature of his own of the name of Trie, of the whole transaction; it is certain that he forwarded to the authorities, through Trie, private documents which Servetus had intrusted to him, with a view to the heretic's identification, and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and, after several months' wandering, he was found at Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he arrived at Geneva on his way. This is the explanation of an event otherwise unaccountable. Having ventured to church, according to the common account, he was recognized, apprehended, and conveyed to prison by C.'s order, just as he was about to leave the city. The particulars of his trial are full of interest, but too lengthened to be detailed here. It lasted, with various interruptions, for two months. He attacked C. with the most foul epithets, and C. retorted with a virulence and foulness quite equal to his own. At length, on the 26th of Oct., 1553, sentence was passed upon Servetus, condemning him to death by fire. C. used his influence to have the mode of death alleviated, but without success. On the very next morning, the sentence was put into execution. On an extended eminence at some distance from the city, Servetus was fastened to a stake surrounded by heaps of oak-wood and leaves, with his condemned book and the MS. he had sent to C. attached to his girdle; and, amid his agonizing cries, the fire was kindled, and the wretched man expiated his heresy amidst the flames. Whatever apologies may be urged for this memorable crime, it must remain a mournful and scandalous blot on the history of the reformation. The disgrace of it has particularly attached to C., and with some justice, from the special and unhappy relation which he bore to the whole transaction; but most of the reformers are no less implicated in it. The wise Bullinger defended it, and even the gentle Melancthon could only see cause for gratitude in the hideous tragedy.

After the execution of Servetus, and the expulsion of the Libertines, two years later, C.'s power in Geneva was firmly established, and he used it vigorously and beneficently for the defense of Protestantism throughout Europe. By the mediation of Beza, he made his influence felt in France in the great struggle that was there going on between the hierarchical party, with the Guises at its head, and the Protestants, led by Condé and Coligny. In 1561, his energies began to fail. He had been long suffering from bad health, but his strength of will and buoyancy of intellect sustained him amid all his bodily weakness. In the year now mentioned, his bad health greatly increased, and although he survived for more than two years, he never regained any vigor. He died on the 27th of May, 1564.

Very different estimates, it may be imagined, have been formed of C.'s character, according to the point of view from which it is contemplated. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit, and unyielding in will, he is never selfish or

petty in his motives. Nowhere amiable, he is everywhere strong. Arbitrary and cruel when it suits him, he is yet heroic in his aims, and beneficent in the scope of his ambition. Earnest from the first, looking upon life as a serious reality, his moral purpose is always clear and definite—to live a life of duty, to shape circumstances to such divine ends as he apprehended, and, in whatever sphere he might be placed, to work out the glory of God.

He rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious: he *systematized its doctrine*, and he *organized its ecclesiastical discipline*. He was at once the great theologian of the reformation, and the founder of a new church polity, which did more than all other influences together to consolidate the scattered forces of the reformation, and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, then in process of formation, his fame is second to none in his age, and must always conspicuously adorn the history of civilization. Among C.'s most important works are: *Christianæ Religionis Institutio* (Basel, 1536); *De Necessitate Reformandæ Ecclesiæ* (1544); *Commentaires sur la Concordance ou Harmonie des Évangélistes* (Gen. 1561); *In Novum Testamentum Commentarii*; *In Libros Psalmorum Commentarii*; *In Librum Geneseos Commentarii*. The first edition of C.'s whole works is that of Amsterdam, 1671, in 9 vols. fol. A complete critical edition by Baum, Cunitz, and Reuss began to appear at Brunswick in 1869. By the "Calvin translation society," in Edinburgh, his works have been collected, translated into English, and issued in 51 vols. 8vo, 1843–55. Besides the original *Vita* by Beza, there are lives of C. by Bolsec (from the Catholic standpoint, 1577; new ed. 1875), Audin (1840), Bungener, Viguet and Tissot (1864); and in Germany, by Henry (1844), Stähelin (1868), and Pierson (1888).

CALVINISM is the system of religious doctrine associated with the name of Calvin, and supposed to distinguish the churches more particularly called the reformed, in contradistinction to the Lutheran and Anglican churches. Calvin's doctrinal views are laid down at length in his *Institutio Christianæ Religionis*, first published in 1536. It was not till many years later, however, that the name of C. came to be attached to a certain set of doctrinal opinions, and not till the rise of Arminius (q.v.) and the synod of Dort (q.v.) in 1618, that these opinions may be said to have been polemically marked off from others with which they are generally contrasted, and to which they are recognized as standing in opposition.

The difference of thought expressed in the Arminian and Calvinistic system is as old as the history of Christian doctrine. In almost every point, Augustine may be said to have anticipated Calvin; while Pelagius and the eastern divines, such as Chrysostom, represented a type of opinion upon the whole consonant to that which in more modern times has been opposed to Calvinism. In the Roman Catholic church, since the reformation, the same opposition of thought has presented itself in the famous contest of Jansenism and Jesuitism.

The main point of distinction in the two systems or modes of Christian opinion, is as to the operation of divine grace in the salvation of sinners. In the one system, this operation is considered as predetermined and absolute; in the other, as merely prescient, and in some sense conditioned. *Predestination* and *irresistible grace* are the great key-notes of C.—its two main points. Others were added in opposition to Arminianism—viz., *original sin*, *particular redemption*, and the *perseverance of the saints*; but the first of these is not peculiarly Calvinistic, and the last two are merely corollaries from the doctrines of predestination and grace. Predestination is, in fact, the one distinguishing doctrine of the system, as it was of Augustinianism, of which C. was merely the revival. The divine will, apprehended as decreative and predestinating, is necessarily *irresistible* in its efficacy, *select* in its objects, and *persevering* in its results. The characteristic of C., therefore, is that it is a speculative Christian system, springing from a single great principle, carried out rigorously into all its logical consequences.

The church of England, in its earlier history, was Calvinistic in its creed, although mediæval and Catholic in its ritual. Puritanism was nothing else than a movement to reduce it altogether to a Calvinistic model. In the reaction which followed this movement, the church of England, while retaining its original articles, nearly parted with its Calvinistic faith; and throughout the 18th c., its chief divines are conspicuously Arminian or latitudinarian. But with the revival of the evangelical party in the end of the century, C. revived; and it still maintains, if not an absolute sway, yet a powerful influence over many minds in the Anglican establishment, while it is the professed creed of a great proportion of the dissenters.

The Church of Scotland, along with the other Presbyterian churches in Gt. Britain, and the large and numerously increasing bodies of Presbyterians in America, all hold to the Westminster confession of faith, the most elaborate and formal expression of Calvinistic doctrine that exists. But while holding to the same Calvinistic standard, these churches show many varieties of actual opinion; and in the history of Presbyterianism, C. has shown a tendency in its logical development to pass into rationalism or Unitarianism. This is conspicuously the case in the church of Geneva itself, and some of the old Puritan churches of America. It still remains, however, as opposed to Arminian, Socinian, or any cognate forms of the same type of doctrine, the most living and powerful among the creeds of the reformation.

CALVINISTIC METHODISTS, in Great Britain, are in three divisions: the Whitfield Connection, 1741; Lady Huntingdon Connection, 1748; and Welsh Methodists, 1750.

CALVI'SIUS, **SETHUS**, 1556-1615 or 17; astronomer and chronologist of Germany, who organized a system of chronology embodying the history of the world. The work was commended by Scaliger and Casaubon, but was condemned in the *Index Expurgatorius*. In 1612, he published a work on the Gregorian calendar, undertaking to show the inadequacy of that system and to supplant it with one founded upon astronomical principles.

CALW, or **KALW**, an important manufacturing t. in Württemberg, chief seat of the Württemberg timber-trade with Holland, and capital of a bailiwick of the same name, in the circle of the Black forest, lies in the valley of the Nagold, on both sides of the stream, over which are two stone bridges. Cotton and woolen spinning, dyeing turkey-red, manufacturing woolen and cotton fabrics, making leather, stout shoes, cigars, etc., are the principal industries. Though the streets in the old town are irregularly built, there are many large and beautiful houses. Pop. 5000.

CALX is the Latin term for quicklime. As quicklime is produced by burning limestone, the alchemists applied the term *C.* to the product obtained by burning any ore or other mineral substance; and *calcination* (q.v.) to the process.

CALYCANTHUS (Gr. calyx-flower), a genus of plants of the natural order *calycanthaceæ*, an order allied to *rosaceæ*, and of which only a few species are known, natives of North America and Japan—shrubs, with square stems, which are of remarkable structure, having around the central woody axis four smaller imperfect ones. An aromatic fragrance characterizes this order. In the genus *C.*, the bark and leaves possess it as well as the flowers. The bark of *C. floridus*, a native of Carolina, has been used as a spice and carminative, and has acquired the name of Carolina allspice, or American allspice. The flowers are of a chocolate color.

CALYDON, an ancient city of Ætolia, $7\frac{1}{2}$ m. from the sea on the river Evenus, said to have been founded by Calydon, son of Ætolus, to have been the scene of the hunting of the Calydonian boar by Meleager and other heroes, and to have sent soldiers to the Trojan war. In 391 B.C., it was in possession of the Achæans, and so late as the time of Pompey, it was a place of importance. In 31 B.C., Augustus removed the inhabitants to Nicopolis, a city then founded to commemorate the victory of Actium.

CALYDONIAN BOAR. Once upon a time, according to a Greek myth, a certain Ceneus, king of Calydon, the ancient capital of Ætolia, omitted a sacrifice to Diana, whereupon the goddess, in her rage, sent into his fields a frightful boar, which committed great devastation. No one had the courage to hunt it except Meleager, the son of Ceneus, who, calling to his help the bravest heroes of Greece—Theseus, Jason, Nestor, and others—pursued and slew the monster. Later writers, however, affirm that he found it impossible to destroy the animal, until Atalanta, his mistress, aided him by piercing it with an arrow.

CALYMENE, a genus of the fossil order trilobites (q.v.). It differed from the other genera of the order in the individuals having the power of rolling themselves into a ball, so that they are often found coiled up like an oniscus, i.e., hog-louse—*vulgo*, a slater. The genus is characteristic of the Silurian formation. The species we figure has been long known as the "Dudley locust." It is remarkable as a very long-subsisting species, passing from the Caradoc beds to the Ludlow rocks. Twenty species have been described. See illus., SILURIAN AND DEVONIAN FOSSILS, vol. XIII.

CALYPSO, in Grecian legend, was, according to Homer, the daughter of Atlas, and inhabited the solitary wooded isle of Ogygia, far apart from all gods and men. Ulysses being thrown upon her island by shipwreck, she treated him kindly, and promised him immortality if he would marry her. He was fascinated by her charms, but unwilling to desert his wife and his native land; she detained him, however, seven years, and bore him two sons. On his departure, she died of grief.

CALYPSO BOREALIS, an orchid with heart-shaped leaf, and beautiful yellow, pink, and purple flower; growing in the bogs and moist woodlands of Northern New England, Oregon, Canada, and northern Europe and Asia.

CALYPTRÆA (Gr. *kalyptra*, a head-dress), a genus of gasteropodous mollusks, of the order *pectinibranchiata*, the type of a family, *kalyptræidæ*, formerly included in the genus *patella*, or limpet, when the mere form of the shell was more regarded in classification than the structure of the animal, and still known as chambered limpets, cup-and-saucer limpets, bonnet limpets, and slipper limpets. The shell is limpet-shaped, but the apex is more or less spiral, and has a calcareous process from its inner surface for the attachment of a principal muscle. The *kalyptræidæ* differ much in shape, some being very flat, and others very conical; some elongated and slipper-like. The species are generally natives of the shores of warm climates. Only two are British.—*Kalyptræidæ* are common in the older fossiliferous rocks.

CALYX (a term originally Greek), in botany, the outermost of the circles of modified leaves which surround the parts of fructification, and along with them constitute the flower. Within the *C.* there is generally at least a second circle of leaves, called the corolla (see COROLLA and FLOWER); but this is sometimes wanting, and the *C.* is

the only envelope of the parts of fructification. The leaves of which the C. is composed are called *sepals*, when quite separate from each other; but they often grow together into a tube at the base, and the C. is then said to be *monosepalous* or *gamosepalous* (*monos*, one; *gamos*, union). The sepals are generally simple and without stalks; they are generally green, and differ much less widely from ordinary leaves than the petals or leaves of the corolla; sometimes, however, they are *petaloid*, and brightly colored, as in *fuchsia*. The C. and corolla of many endogenous plants resemble one another almost completely, and the common term *perianth* (q.v.) is then very generally employed. In some plants, the C. passes insensibly into the corolla, and it is not easy to distinguish the innermost sepals from the outermost petals. The C. is in such cases often composed of more circles of leaves than one. The C. occasionally falls off when flowering is over (*deciduous*), as in *ranunculus*; sometimes even when it commences (*caducous*), as in the poppy; generally it remains till the fruit is ripe (*persistent*), and is then much enlarged and more brightly colored, as in *physalis*. It often becomes fleshy, and forms the seeming fruit, as in the rose.—The glumes (q.v.) of grasses, etc., used to be regarded as a C., to which, however, they have no proper analogy.

CAM, or **GRANTA**, a river of England, which, rising in Essex, flows n.e. through Cambridgeshire, and after a course of about 40 m., joins the Ouse $3\frac{1}{2}$ m. above Ely. It gives its name to the town of Cambridge, which stands upon it, and below which it is navigable, and is classic on account of the boat-races on it by Cambridge students.

CAM, in machinery, a curved plate or groove, by which motion is communicated and controlled. The moving plate or groove is a *driver*; the rod, bar, or other thing moved, is called the *follower*. The follower is held against the driver by its weight or by a spring, or other device. The radii of the driver determine by their length the motion of the follower, and the angles which they make with some one, chosen as a base of calculation, fix the time at which change of motion occurs. For example, it may be desired that the follower shall move upward, and then downward, with a uniform velocity. From the center of the driver any convenient number of radii may be drawn, dividing equally the 360° of angular space. On one of these radii we mark the distance from the center of the driver at which the point of the follower will stand when in its position nearest to that center. Upon the opposite radius, distant 180° from the first, the point is marked which gives the furthest position of the follower; the difference between these radii being divided into as many equal parts as we have made angular spaces in the 180° , we increase the length of each radius in succession, beginning with the shortest, by one of those parts, and we draw a curve connecting the ends of the radii so terminated. Of course the greater the number of parts chosen for the division of the angular space and of the difference of the first and last radii, the more accurately will the curve be drawn. The edge of the driving-plate being cut to this curve, the follower being made to press constantly against it, and the driver being turned with a uniform rotation, the follower will move through its limited space with an equable motion, because the radii of the driver increase by constant amounts, at constant intervals of time. If the curve is reversed, the second part being the symmetrical opposite of the first part, the follower will descend as uniformly as it rose. The cam thus drawn is one of frequent use, and is called the *heart-shaped cam*. To avoid friction the end of the follower often carries a roller which works against the surface of the cam; in this case the cam-surface is found by drawing a line parallel to that above described, at a constant distance equal to the radius of the roller. If we wish the follower to rest at any part of a cycle of motion, the radii for that time will be made equal, and the corresponding cam-surface will be a circular arc; the time will be such a part of that of a complete cycle, as the angle between the radii of the ends of this arc, is of 360° . The cam-plate has sometimes a groove cut upon its flat side, and the end of the follower runs in the groove. A spiral groove may be cut into the surface of a cylinder as in a screw; if a follower be inserted in this groove it will be driven forward as the cylinder turns; when the groove reaches the end of the cylinder, it may turn back, and cause the follower to return with the same motion, or if the pitch of the groove be made shorter or longer, the return of the follower will be changed accordingly. By a judicious construction and arrangement of cams, almost every variety of motion may be produced with the greatest precision as to time and amount. A cam-form which does not make a complete revolution, but after moving a short distance in one direction oscillates in the opposite direction, is called a *viper*. A familiar example may be seen in the engine-room of a steamboat, in the rocking arms which raise and let fall the valve rods.

CAM, Diogo, a Portuguese navigator of the 15th c., who continued the w. African discoveries commenced by Dom Henry. He had sufficient influence with the king of Congo to induce that monarch to permit the establishment of Christianity in his dominion.

CAMALDOLITES, a religious order founded in the vale of Camaldoli, near Arezzo, in the Apennines, in 1018, by St. Romauld, a Benedictine monk, and a member of the noble family of the dukes of Ravenna. From Italy it spread into France, Germany, and Poland. The brethren, who wear a white garment, are, and have always been, characterized for the excessive rigidity of their monastic rule; but except to show to

what lengths in a cruel mortification of natural life man can proceed, they have been practically useless in the world. The order is now almost extinct.

CAMARGUE. See BOUCHES DU RHONE.

CAMARIL'LA, a Spanish word, diminutive of *camara*, literally signifies a little chamber. As *camara* is used to designate, *par excellence*, the chamber of the king of Spain, the royal chamber, so C. is also used to designate his private chamber or cabinet, the place where he receives his most intimate friends, courtiers, sycophants, and all the moral refuse that naturally gathers round a weak throne. Hence, in the political language of modern Europe, it has come to signify the influence exercised on the state by secret and unaccredited councilors, in opposition to the opinions of the legitimate ministry, an influence which in Spain particularly is most pernicious. The word first obtained this meaning in the time of Ferdinand VII., who was excessively addicted to the unkingly habit of listening to the insinuations of the companions of his pleasures.

CAMARI'NA, an ancient city of Sicily, near the mouth of the Hipparus, 20 m. e. of Terranova. It was founded by Syracusans in the 6th c. B.C., but soon after was destroyed, because it had thrown off its allegiance. It was restored 495 B.C., but again depopulated, being finally established about 34 years later. In 258 B.C., most of its people were sold by the Roman consuls as slaves. It continued to exist until the 2d c., but since then has been in ruins.

CAMAYEU and **MON'OCROME** are terms by which painting in one color is designated. The ancients painted thus both in gray (*en grisaille*) and in red. Pictures of several tints, but where the natural colors of the objects are not copied, are said to be *en camayeu*. As one color generally prevails, we speak of blue, red, yellow, green *camayeu*. Polidori Caravaggio, for example, so overlaid his other colors with brown, that his works give the impression of monochrome paintings. Drawings in Indian ink, red and black chalk, pencil, etc., as well as engravings, may be said to be *en camayeu*.

CAMBACÉRÈS, **JEAN JACQUES RÉGIS**, Duke of Parma, and high chancellor of the French empire, under Napoleon, was b. at Montpellier, Oct. 18, 1753. In 1791, he was appointed president of the criminal court in his native place. Afterwards, as member of the national convention, he took a prominent part in sketching the new code of laws, and distinguished himself by his moderation. He denied the right of the convention to condemn the king, and though he voted him guilty, argued in favor of a reprieve. After the revolution of the 9th Thermidor (July 27, 1794), C. was elected president of the convention, and, as head of the committee of public safety, was active in procuring peace with Prussia and Spain. His enemies having succeeded in expelling him from office, he engaged himself in legal studies, and laid before the council of five hundred the sketch of a civil code which afterwards formed the basis of the *Code Napoléon*. In 1796 C. was for a short time made president of this council. After the changes made in the directory, he was made minister of justice, after the revolution of the 18th Brumaire (Nov. 9, 1799), was made second consul, and faithfully attached himself to the interest of Napoleon, by whom he was raised to the office of high chancellor of the empire, and in 1808 was made duke of Parma. He endeavored to dissuade Napoleon from the projected invasion of Russia, but in this instance his advice was vainly given. In 1813, when Napoleon took the field against the allies, C. was left as president of the regency, and in this capacity accompanied the empress to Blois, 1814. From this place he sent to Paris his vote for the abdication of Napoleon. During the hundred days, against his own will, he was made minister of justice, and president of the chamber of peers. After the second restoration, C. lived privately in Paris for some time; but in 1816 was exiled for having taken part in the execution of Louis XVI. In 1818, his civil and political rights were restored, and he returned to Paris, where he lived retired to the time of his death, Mar. 5, 1824. Among the men of the revolution, C. was one of the few whose activity was peaceable and truly progressive. His services in the establishment of law were great. His nature was mild and candid, and his intellect very acute.

CAMBA'LUC, or **CAMBALU'** (Mongol, *Kaan-Baligh*, "city of the Khan"), the city now known as Peking. It was captured in 1215 by Genghis Khan, and in 1264 adopted as the imperial residence by his grandson Kublai, who founded a new city near the old one of Yenking. The new city, Ta-tu, or "great capital," was a rectangle about $5\frac{1}{2}$ m., or more than 18 m. in circumference, surrounded by a colossal wall of mud, having an inner inclosure for the palace and gardens of the khan. There were 11 gates, and the streets ran towards them in direct lines. It was the residence of the Mongol emperors until the fall of their power in 1368. Soon afterwards the native dynasty gave it the name of Pe-king, or "north court," by which name it was known to the early Jesuit missionaries; but now the native name in ordinary use is King-Cheng or King-tu, signifying "the capital." The restoration of Cambaluc was commenced in 1409; the size was diminished, and the town made more nearly a square, and in this form now constitutes the "Tartar city" of Pe-king. The walls were finished in 1437. In 1544, the "outer city" was formed, the portion now known as "the Chinese city." The whole city under the name Cambaluc was made an archiepiscopal see by pope Clement V. in 1307.

CAMBAY', a city, district, and gulf at the n. w. extremity of the peninsula of Hindustan. — 1. C., the city, stands at the head of its gulf, and on the right bank of the Myhee, 76 m. to the n. n. w. of Surat. It contains about 31,400 inhabitants, having been at one time much more populous — ruinous palaces, mosques, and tombs, and an excavated temple of considerable pretensions, attest its former magnificence and extent. The main cause of its decay has been the gradual obstruction of its seaward navigation. — 2. C., the district, contains an area of 350 sq. m. It is attached to the presidency of Bombay. — 3. C., the gulf is in w. India between the Bombay coast and the peninsula of Kathiawar.

CAMBER, in ship-building, implies a slight arching or convexity upwards. A "cambered" ship is one in which the floor is higher in midships than at the stem and stern. — The name "camber" is also given to a small dock in a dockyard, for containing boats, and for loading and unloading timber.

CAMBERT, ROBERT, 1628-77; the first composer of French operas; organist of the church of St. Honore, and musical superintendent to Anne of Austria, the mother of Louis XIV. When Lulli was made musical superintendent to the king, in 1673, C. went to London, where Charles II. made him master of the band. His chief works were *Ariadne, or the Amours of Bacchus; Pomona*; and *The Pains and Pleasures of Love*.

CAMBERWELL, once a rural village, now a suburb of London, on the s. side of the Thames.

CAMBERWELL BEAUTY, *Vanessa antiopa*, one of the largest and most beautiful British butterflies, rare in Britain, although it has been found in many parts of the country, but common in the central and southern parts of Europe. The wings are of a deep brown color, with a band of black around the brown, and an outer band or margin of pale yellow, the black band containing a row of large blue spots, the yellow margin dappled with black specks, all the colors rich and velvety. The margin of the wings exhibits tooth-like angularities. The antennæ are terminated by a knob. The caterpillar feeds on the willow. It is black, with white dots and a row of large red spots down the back, and is rough with soft spines. — When Camberwell was more rural than now, and abounded in willows, this butterfly was sometimes taken there.

CAMBIO—CAMBIST. The former of these two words is the Italian for *exchange*; the latter, for a *money-changer*. Cambist is also used figuratively as the title of a book in which the moneys, weights, measures, etc., of various nations are given in the equivalents of some particular one. For instance, Kelly's *Universal Cambist* gives these in English, and the *Cambista Maltesa* in Italian.

CAMBIUM (Lat. *cambio*, I change), in botany, a layer of mucilaginous viscid matter, particularly abundant in spring, interposed between the woody layers and the bark of trees and other stems. Delicate cells (*cambium cells*) are formed in it, which certainly fulfill important functions in the formation of new wood, although, notwithstanding much investigation by some of the greatest vegetable physiologists of our time, the nature of these functions is still very imperfectly ascertained. The medullary rays are connected with the C. cells, and these cells gradually elongate into the shape which belongs to those of woody tissue. The C. layer is found only in exogenous stems.

CAMBO'DIA, or CAMBO'JA (native name, *Kan-pou-chi*), an extensive country of the Indo-Chinese peninsula, now a protectorate of France, bounded on the s.w. by the gulf of Siam, on the s.e. by French Cochinchina, and on the n. by Siam. Area about 40,000 sq. m.; pop. about 1,500,000. The surface is mostly flat, and the soil fertile. There are extensive forests, which shelter elephants and deer; there are also wild cattle and ponies, and the rhinoceros abounds. Among the chief products are rice, betel, tobacco, indigo, sugar-cane, pepper, maize, cinnamon, and coffee. Its foreign trade is carried on largely through the port of Saigon in Cochinchina. The imports include salt, wine, tea, textiles, arms, and pottery; the exports, salt-fish, cotton, beans, tobacco and rice. Its principal towns are Pnomtenh, the capital of the territory with a population of 50,000, and Kampot. The country is under the direct rule of a native king who acknowledges the protectorate of France. With Anam and Tonquin, it was united into a customs union in 1887 and, together with these two provinces and Cochinchina, is under the superior council of Indo-China, which gives advice as to the financial measures affecting the provinces.

CAMBO'GE. See GAMBOGE.

CAMBON, JOSEPH, 1754-1820; a French financier. He was a member of the national convention of 1792 and of the committee of safety of the next year; and in 1794 promoted the downfall of Robespierre. He is credited with having laid the foundation of the financial system of France. In 1816 he was exiled.

CAMBORNE, a t. of Cornwall, 11 m. n.w. of Falmouth. It is surrounded by very productive copper, tin, and lead mines. C. church has a stone inscription of the 10th century. Pop. '91, 14,700.

CAMBRAI, a city of France, in the department of the Nord, about 32 m. s.s.e. of Lille. It is situated on the right bank of the Scheldt, is strongly fortified and well built, with tolerably wide, but irregular streets, and many picturesque old houses. The

cathedral, archiepiscopal palace, town-house, and theater are among the principal public buildings. The city was greatly injured in 1793, when the revolutionists, among other vandalisms, razed the fine cathedral. They also disinterred the remains of Fénélon, who was archbishop here, and melted his lead coffin into bullets. A monument, however, by David the sculptor was erected (1825) in the new cathedral, in memory of the immortal author of *Télémaque*. The manufactures of the city are important, consisting of cambric—so called from its manufacture here—linen-thread, lace, cotton-yarn, beet-root sugar, soap, starch, leather, etc. It has also a trade in agricultural produce. The pop. in 1891 was 24,100.

C. was known to the Romans under the name of *Camaracum*, and it was then one of the chief cities of the Nervii. It was fortified by Charlemagne, and was long governed by its own bishops, to whom Charles the bald ceded it. The celebrated league against the republic of Venice, which comprised the pope, the emperor of Germany, and the kings of France and Spain, was entered into here in 1508, and takes its name from the city. Here also were concluded treaties between the French king and the German emperor in 1529, and in 1724-25, between Charles VI. and Philip V. of Spain. During 1815-18 it was the head-quarters of the British army of occupation.

CAMBERIA, a co. in s.w. Pennsylvania, drained by affluents of the Susquehanna and Alleghany rivers, and intersected by the Pennsylvania railroad; 680 sq.m.; pop. '90, 66,375. It is a high and broken table-land, with abundance of coal and iron. Agriculture is the chief business. Co. seat, Ebensburg.

CAM'BRIA, the ancient name of Wales, the *Britannia Secunda* of the Romans. The name is derived from that of Cimbri or Cymri, by which the Welsh have always called themselves. See **BRETTS AND SCOTS**.

CAMBRIAN SYSTEM, the name given to the great series of sedimentary deposits which comes next in order of succession to the archæan system (q.v.). Whenever the base of these deposits can be seen, the beds are found to rest unconformably upon the archæan, or, as they are sometimes called, the pre-Cambrian rocks. There is some diversity of opinion as to the upper limits of the Cambrian. The name was introduced by Professor Sedgwick, by whom it was made to include a great thickness of strata, which most geologists now prefer to consider as forming the lower portion of the succeeding Silurian system. The British Cambrian rocks are best developed in South Wales, and are also well represented in Shropshire, etc. In Ross-shire they form the pyramidal mountains of Suilven, Canisp, and Coulmor. Cambrian strata with a few fossils have also been recognized in the southeast of Ireland, where they attain a thickness of 14,000 feet. Cambrian strata are for the most part unfossiliferous—organic remains being met with chiefly in the higher members of the system. The plant life of the period is very sparingly, if at all represented, for it seems doubtful if the fucoid-like markings are really tracings of plants, some being not improbably the tracks or trails of worms, etc. Animal life is surprisingly well represented, as by sponges (protospongia), sea-lilies (dendrocrinus), cystideans (protocystites), and star fishes (paleasterina). Crustaceans are plentiful—the modern groups of ostracods (water-fleas) and phyllopods (brine-shrimps, etc.) being represented. The most notable crustaceans, however, are the trilobites (q.v.), some of which were very minute and blind (agnostus), while others attained a length of one or two feet. The brachiopods belong almost exclusively to the "inarticulate" group—the most characteristic forms being *lingulella*, *discina*, and *obolella*. Four out of the five classes of mollusks now existing appear in the Cambrian, viz., lamellibranchs, pteropods, gasteropods, and tetrabranchiate cephalopods. The lamellibranchs and gasteropods, which attain their maximum in our own day, appear to have been but sparsely present in the seas of Cambrian times, but some of the gasteropods, such as the snail *pleurotomaria*, are types still living. The same is the case with some of the brachiopods. No indubitable traces of vertebrate life have yet been supplied by the Cambrian strata, nor have we any evidence of land or fresh-water forms, although it is quite possible that some of the mollusks may have lived in estuaries or brackish water. The general character of the sedimentary rocks, with their conglomerates, grits, etc., ripple marks, and animal tracks, is indicative upon the whole of shallow-water conditions; and the general absence of corals and of limestones points in the same direction. Although the fauna is less varied and abundant than that which has left its traces in the succeeding Silurian, yet we cannot but be struck with the fact that the Cambrian is relatively so varied. For here in the very oldest fossiliferous strata (if the archæan with its eoözon be for the moment put out of account) we have most of the larger divisions of the animal kingdom represented. Hence believers in the doctrine of evolution are of opinion that the Cambrian fauna cannot possibly be the earliest, but must have been preceded by a long series of ancestors; and not only so, but that many forms of life must have existed in the Cambrian seas which have left no trace behind them. Cambrian rocks have been recognized in various other parts of Europe, as in central and southern Sweden, where the strata are not nearly so thick as in the British area. In central Brittany and in the Ardennes, they are likewise represented, and they also come to the surface in several provinces of Spain. The most important continental area, however, is that of Bohemia, where the

palaeozoic rocks and their fossils have been studied in great detail by Barrande. He divides the strata into several zones, his *primordial zone* having yielded many organic remains; especially trilobites belonging to characteristic Cambrian genera. In North America, the Cambrian or primordial system comprises an upper series of shales and sandstones (Acadian series) and a lower one of sandstones, etc. (Potsdam series). These strata have been recognized in Newfoundland, Nova Scotia, New Brunswick, and Canada, and in the states of Vermont, Massachusetts, and New York. They appear also in many different places along the Appalachian chain and in the region of the Rocky Mountains. The Cambrian rocks of Europe are frequently much altered and metamorphosed, while in North America they show, over certain wide areas, comparatively little alteration, the Potsdam sandstone especially being not unlike many "freestones," so that it is much used for building purposes. Igneous rocks are associated with the Cambrian in various parts of Europe.

CAMBRIC, a general term applied to the finest and thinnest of linen fabrics. It is said to be derived from Cambrai, where such goods were first made. Some of the finest cambrics of the present day are produced in Switzerland. Scotch C. is really a muslin, being made of cotton with the fiber twisted very hard, to imitate real or linen cambric.

CAMBRIDGE, fourth city in size in Mass., and one of the shire towns of Middlesex co., on the Charles river, in lat. $42^{\circ} 28' \text{ n.}$, long. $71^{\circ} 7' \text{ w.}$, and opposite Boston, of which it is practically a suburb, being connected by seven bridges. It is entered by the Boston and Lowell, and Fitchburg railroads, and electric railroads connect with Boston and adjacent towns. Cambridge originally included the present towns of Lexington, Arlington, and the Brighton district of Boston. It was settled as New Town, in 1630, by Gov. Winthrop and others, who intended it to be the chief place in the colony, but found the peninsula of Shawmut (Boston) better adapted for commerce and for defense against the Indians. Re-settled in 1631, it received, in 1633, its first pastor and teacher, Rev. Thomas Hooker (q.v.) and Rev. Samuel Stone (q.v.), who removed with their congregation to Connecticut in 1636, having sold their lands to new emigrants. In 1637 the general court ordered that the college it had previously decided to found be established at Newtowne, and in 1638 that Newtowne become Cambridge. In that same year the first class began its studies, and the name Harvard College was given to the modest institution. See HARVARD, JOHN. During the time Boston was held by the British army (1775-76) Cambridge was occupied by the American army, and Washington assumed command in 1775 under a large elm, which is still standing. The city charter of incorporation was granted in 1846. Cambridge claims to have enlisted the first company of volunteers for service on the northern side on the outbreak of the civil war, and during that conflict it furnished 4588 men to the union army and navy.

Cambridge is irregular in shape; generally level in surface, with some marshy land along the river, and covers an area of about ten square miles. It embraces Old Cambridge and North Cambridge, both residence quarters chiefly, East Cambridge (formerly Lechmere's point), Cambridgeport and Mt. Auburn. Its climate is much like that of Boston. It has an excellent system of sewers, draws its water supply from Fresh pond and Stony brook, and has waterworks which cost about \$2,500,000. Its streets and avenues are shaded with beautiful old trees, and there are many handsome residences and well preserved colonial mansions, among them the house occupied by Gen. Washington and, later, the home of the poet Longfellow, fronted by a memorial park, and Elmwood, the dwelling of James Russell Lowell. The principal features of Old Cambridge are Harvard university (q.v.), with its ample grounds and many buildings, the buildings of the Protestant Episcopal divinity school, the First Unitarian church, the Shepard Memorial church (Cong.) commemorating Rev. Thomas Shepard (q.v.), and Christ church (P. E.). The city common contains a soldiers' monument, erected at a cost of \$35,000. Less than a mile from the college is the botanical garden of eight acres, filled with a great variety of trees, shrubs, and plants, especially of native species.

A cemetery of forty-one acres lies in the western part of the city, and twelve acres of Mount Auburn, one of the most beautiful places of burial in the country, are within the city limits. Cambridge has numerous churches, a Latin school, an English high school, a manual training school for boys, more than thirty public schools, the Dowse institute affording free lectures, two public libraries, and daily, weekly, monthly, and quarterly periodicals. The Riverside Press and the University Press, at Old Cambridge, are widely known; the latter, the oldest in the United States, having been founded in 1639. The chief industries besides printing, publishing, and bookbinding, and slaughtering and meat packing, are the manufacture of furniture, organs, pianos, and other musical instruments, soap and candles, foundry and machine shop products, brick and tile, carriages, glass, brushes, biscuits, chemicals, rubber goods, and telescopes. The capital employed in manufactures in 1890 was \$20,331,585; value of products \$35,975,089. East Cambridge has a large lumber trade. There are six national and four savings banks, and a fire insurance company. The city is governed by a mayor, a board of aldermen and a common council. The city hall is at Cambridgeport, and the court-house, jail, and principal manufactories at East Cambridge. The valuation of all property in 1896 was \$83,954,495; the city debt, \$3,913,634. Pop. 1790, 2112; 1830, 6072; 1850, 15,215; 1880, 52,740; 1890, 70,028.

CAM'BRIDGE, the chief t. of the co. so named, lies 48 m. n.e. of London. It takes its name from the river Cam, which was anciently called the Granta. By the Saxons, C. appears to have been known as Grantabrycege, which is found with many slight variations of spelling, and probably became abbreviated into Cantrbrige. It is also supposed that C., and not the adjacent village of Grantchester, was the Grantaceaster of the Saxons. There are, however, traces of a camp at Grantchester. In 870, the Danes ravaged the country hereabouts, and are said to have destroyed the town. King John, in the second year of his reign (1200 A.D.), granted a charter to the town, permitting it to have a guild of merchants, and in 1207, confirmed the burgesses in their privileges in perpetuity. In 1225, they paid a fine of 50 marks for having their liberties; and in 1227, Henry III. confirmed their charters. The town now sends one member to parliament, though until 1885, two. The university sends two members of its own. The population of the municipal borough in 1881 was 35,363, and in 1891 it was 36,983. C. has many churches belonging to the church of England, besides chapels belonging to the Baptist, Congregationalist, and other bodies. The most curious church is that of the Holy Sepulchre, which is one of the few in England that have a round tower. The town is not generally pretty or picturesque, but the gardens at the backs of the colleges, by the Cam, are extremely beautiful in the summer months.

CAMBRIDGE, ADOLPHUS FREDERICK, Duke of, 1774-1850; youngest son of George III., and uncle of Queen Victoria. He served as an ensign in the army, and was educated afterwards at Göttingen, returning home in his 20th year. In the Netherland campaign of 1793, he was taken prisoner by the French, but was almost immediately exchanged. Thereafter most of his public duty was in Hanover as governor and viceroy, until the separation of Hanover from the British crown in 1837.

CAMBRIDGE, GEORGE WILLIAM FREDERICK CHARLES, Duke of, b. 1819; field-marshal and commander-in-chief of the British armies; first cousin of Queen Victoria, son of Adolphus Frederick, duke of Cambridge; succeeded to his title July 8, 1850. In 1837 he was col., and in 1854, lieut.-gen. commanding the first division sent in aid of Turkey against Russia. He led the troops at Alma and at Inkerman. In consequence of ill health he returned to England, and in 1856 became acting commander-in-chief of the British army; in 1862, he was made field-marshal; in 1887 received the patent of commander-in-chief; and in 1895 was retired, and succeeded by Lord Garnet Joseph Wolseley (q.v.).

CAMBRIDGE, UNIVERSITY OF, one of the two ancient institutions of the kind existing in England. Overlooking several fabulous accounts of its origin, its true history may be said to begin at the opening of the 12th century. It was in 1110 that Joffrid, abbot of Croyland, sent over to his manor of Cottenham, near Cambridge, Gislebert, his fellow-monk and professor in divinity, with three other learned monks. These came over to Cambridge, and in a hired barn taught their sciences, and in a short space of time drew together so great a number of scholars, that in the second year of their coming no single building was able to contain them. Perhaps even this statement is doubtful. At any rate, when Alfred of Beverley was student here—viz., 1129 A.D.—there were as yet no public halls or hostels, but each one lived in his own hired lodging.

The first regular society of students was that of Peterhouse, founded in 1257. About this time, students began to live together in hostels, under the rule of a principal, at their own charges. These hostels were named after the saints to whom they were dedicated, the churches which they adjoined, or the persons who formerly built or possessed them. In the year 1280, there were as many as 34, and some of them contained from 20 to 40 masters of arts, and a proportionate number of younger students; but all these hostels decayed by degrees when endowed colleges began to appear. Trinity hostel survived all the rest, and continued to 1540. The hostels were the beginning of what may be called the *college system*, which distinguishes the sister-universities of Oxford and Cambridge from those of Edinburgh, London, and the continent. See UNIVERSITY.

It was between the latter part of the 13th and the close of the 16th c. that all these royal and religious foundations were endowed which now constitute the university. Hugh de Balsham has the honor of being the first benefactor in this way. Michael House was founded by Hervey de Stanton in 1324, and King's Hall by Edward III. in 1332, both of which were absorbed into Trinity college by Henry VIII., in 1546. Clare hall, as it used to be called, one of the earliest and now one of the prettiest colleges in Cambridge, was founded by the countess of Clare in 1326. Henry VI. has left himself an imperishable monument in the splendid foundation of King's college; and his queen, Margaret, commenced the foundation of Queens' college, which was added to by Elizabeth Widville, queen of Edward IV. Lady Margaret, countess of Richmond and Derby, mother of Henry VII., founded Christ's college and St. John's at the beginning of the 16th c., and also the divinity professorship named after her. Henry VIII. appropriated part of the spoils of the monasteries to the foundation of Trinity college, and queen Mary augmented the endowment. The five regius professorships were endowed by Henry VIII. Cambridge was frequently visited by the plague, and university proceedings were suspended by it in 1642 and 1666. In 1643, Cromwell took possession of the town, and the most eminent loyalists were expelled from the university. Almost all the colleges had sent their plate to the king at Nottingham. As might be expected, little

was done for the university in this troubled century; indeed no new colleges were added until the founding of Downing college in 1800.

The predominance of the religious element in the college discipline is to be attributed as much to the circumstances and manners of the times in which the colleges were founded, as to the piety of the founders themselves. There had been, from very early times, "religious houses," and these were in many cases united with the new collegiate foundations. There were, for example, the Dominicans, or preaching friars, whose house is now turned into Emmanuel college. The friars who lived in these convents were capable of degrees, and kept their "acts," or exercises for degrees, as other university men. There were, however, frequent quarrels between them and the other students. To the same cause is to be traced the condition of celibacy, upon which, with few exceptions, the fellowships were formerly tenable. These conditions had been considerably relaxed before the abolition of the restrictions as to marriage, and (except in the case of offices with clerical functions) holy orders was proposed by the statutes issued in 1881 by the Cambridge commissioners under the universities of Oxford and Cambridge Act (1877). These statutes take the place of those confirmed by the queen in 1858.

The present university statutes were confirmed by Queen Victoria, by order in council, July 31, 1858. The governing body is the senate, and the building where they meet is called the senate-house. All university laws are approved by an elected body called the council, before they are submitted to the senate. The executive powers are intrusted to a chancellor, high-steward, vice-chancellor, commissary, and assessor. The public orator is the voice of the senate upon public occasions. The proctors superintend the discipline and morals of all persons in *statu pupillari*; they are present at all congregations of the senate, read the "graces," and take the votes. The registry is responsible for the graces being offered in due form, and has charge of the university records. There are three terms in this university—the Michaelmas or October term, the Lent term, and the Easter term. To take an ordinary B.A. degree, a student must reside nine terms. The M.A. degree follows four years after. Dissenters are not excluded by the terms of the new statutes from taking degrees, except in divinity.

With respect to the admission of students, their university course, expenses, and proceedings in degrees, the following information may be useful: There are four classes of students—viz., *fellow commoners* and *noblemen, pensioners, sizars*, and the more distinguished students who are elected *scholars* on the foundation of their college. The first class are so called from their dining at the fellows' table; they wear silk or embroidered gowns, and pay heavier fees. The pensioners are the great body of students who are not on the foundation, and who pay for their own commons, viz., dinners in hall, etc., and for their chambers. The sizars are the poorer students, who are admitted at lower charges than the pensioners, but wear the same dress, and are no longer subject to the performance of menial offices as they once were. Some of the colleges, especially St. John's and Trinity, have very liberal endowments for the sizars, and very considerable pecuniary assistance is given to the more deserving of them, so that no youth of real ability, industry, and good character, need be deprived by poverty of the advantages of a university education. Non-collegiate students have lately been admitted to the university under special rules. The scholars are elected, by examination, from the pensioners and sizars; they are on the foundation of the college, have rooms and commons free, and other emoluments. The fellows are subsequently elected from the scholars and the students who have distinguished themselves in the tripos examinations. Vacancies are, as a rule, filled up from members of the college, but many fellowships are open to the competition of the whole university. The usual age of admission is from 17 to 20. Before a student can be admitted, he must obtain a certificate from some master of arts of the university of being sufficiently instructed in Latin, Greek, and mathematics; this certificate must be sent to the tutor of the college, along with the caution-money, which, in the case of a pensioner, amounts to £15.

Residence is commenced in the October term. It is usual, particularly at the larger colleges, to have the name entered on the college boards for a term or two previous; but this is not necessary now, as it used to be, in order to keep such terms with a view to the degree. When the undergraduate comes into residence, he is called a "freshman;" in his second year, a "junior soph;" in his third year, a "senior soph." The ordinary B.A., or bachelor of arts degree, may be taken in the ninth term of residence—viz., in the third June after coming up. The subjects of examination are partly fixed, partly variable. They are the Acts of the Apostles in Greek, one Greek and one Latin classic, *The History of the English Reformation*; *Euclid*, books i., ii., iii., iv., and propositions 1-6 of book vi.; together with certain parts of algebra, mechanics, and hydrostatics. The candidates for examination for degree are called questionists.

The successful candidates are arranged in a tripos. The following regulations for the triposes came into effect, 1882: the mathematical tripos is divided into three parts. The first two parts take place in June at the close of the third year, or ninth term of residence, and the successful candidates are arranged into Wranglers, Senior Optimes, and Junior Optimes, the members of each class being also placed in the order of merit. Only the Wranglers may proceed to the third part of the examination in the following January. The subjects for this part are divided into four groups, excellence in any one of which entitles to the highest honor. According to their success in this examination, the Wranglers are re-arranged in three classes, the names in each class being,

however, in alphabetical order. The classical tripos consists of two parts—the first, in general classical scholarship, and taking place at the end either of the second or of the third year of residence; the other, at the end of either the third or fourth year, and including, besides a further examination in pure classics obligatory on all candidates, a special knowledge of one or two of the following subjects: ancient philosophy, history, archaeology, philology. The examinations for degree are called “great go.” The previous examination, which comes in the second year of residence, is called “little go.” Students who intend to graduate in classical honors, are required to take mathematical honors in little go. The previous examination is one Greek and one Latin author, one of the gospels in Greek, Paley’s *Evidences of Christianity*, and elementary mathematics. After passing the “little go,” the examinations for the ordinary B.A. degree consist of a “general” and a “special” examination, the subjects in the former being similar to those in the little go. The special examination is, at the option of the student, in theology, moral or natural or applied science, or law. The following are the professors: Regius professors of laws, physic, Greek, Hebrew, and divinity, professor of moral philosophy, professor of chemistry, professor of anatomy, professor of modern history, professor of botany, professor of geology, Jacksonian professor of natural philosophy, Downing professors of law and medicine, professor of mineralogy, professor of political economy, professor of archaeology, professor of music, a lady Margaret, a Hulsean, and a Norrisian professor of divinity, two Arabic professors, a Sadlerian and a Lucasian professor of mathematics, a Lowndean and a Plumian professor of astronomy, Slade professor of fine art, professors of Latin, Sanskrit, international law, zoology, experimental physic, mechanism, Anglo-Saxon, surgery, music, physiology, and pathology. Degrees in honors are given in law and in natural and moral science, without requiring further proficiency in the normal studies of the place, classics and mathematics, than is ascertained by passing the little go. There are different fees at the different colleges in addition to the university fees. It will be sufficient to state, that for the B.A. and M.A. degrees, the fees amount to about £12 and £25 respectively.

The great prizes at the university are the *fellowships*, of which there are about 400, some open to all candidates without restriction, but conditions of tenure as to marriage and holy orders vary at different colleges. Their value varies from £100 to £300 per annum, and the senior fellowships are often £500 or more. There are also stipends attached to all the college offices—e.g., those of dean, bursar, steward, etc. The office of tutor is one of great honor and emolument. The chancellor gives annually two gold medals, open to the competition of all students qualified to be candidates for the classical tripos of the year. The members of parliament for the university give annually four prizes for the best dissertations in Latin prose.

The following is a list of the colleges in the order of their antiquity. A particular notice of each college will be found in its alphabetical place:

Name.	Founded.
St. Peter's college, or Peter-house.....	1257
Clare college.....	1326
Pembroke college.....	1347
Gonville and Caius college.....	1348
Trinity hall.....	1350
Corpus Christi, or Benedict college.....	1351
King's college.....	1441
Queens' college.....	1448
St. Catharine's college or hall.....	1473
Jesus college.....	1496
Christ's college.....	1505
St. John's college.....	1511
Magdalene college.....	1519
Trinity college.....	1546
Emmanuel college.....	1584
Sidney Sussex college.....	1598
Downing college.....	1800
Cavendish college.....	1873
Selwyn college.....	1882
Ayerst college.....	1884

The number of undergraduates in 1896 was 2,895 and there were 113 on the teaching staff.

Few of the colleges present an imposing façade to the streets—King's is, perhaps, the only one of which this may be said—but the quiet and picturesque beauty of the courts in the interiors is very pleasing. Dr. Whewell, the late master of Trinity college, built a new hostel in connection with Trinity, which is considered to be in very good taste. Amongst the other public buildings of Cambridge are to be mentioned the senate-house, where university examinations are held, degrees conferred, and all public business of the university conducted. The Fitzwilliam Museum is the finest of the modern additions to the university. Viscount Fitzwilliam bequeathed, in 1816, £100,000 South-sea

annuities, the interest of which was to build and support a museum. He left also a very valuable collection of books, paintings, etc., as a nucleus for future contributions. G. Basevi was the architect. The university library is a fine mass of buildings of different periods, and contains at present more than 200,000 volumes. The geological museum contains the original collection of Dr. Woodward, which, out of respect to the founder, has been kept in its original state, unmixed with more recent and vastly more numerous and interesting acquisitions. The university is indebted for many of these geological treasures to the late Prof. Sedgwick. The mineralogical room contains the valuable collections of the late sir A. Hume, Charles Brooke, and Henry Warburton. The Pitt Press is a Gothic structure built in honor of Mr. Pitt, who was educated at Cambridge. It contains the university printing-offices, which are very extensive. There is also a good anatomical museum.

There is a very good hospital, founded under the will of Dr. Addenbrooke in 1753. The observatory contains some very fine instruments, amongst which is a large equatorial telescope, presented by the duke of Northumberland in 1835. The income of the university is about £33,000, and the aggregate income of the colleges about £300,000 per annum.

The university examinations are now open to women, who are, however, debarred from taking degrees. They reside mostly in Newnham and Girton colleges. University college, Nottingham; St. David's, Lampeter; Firth, Sheffield, and the university of New Zealand are affiliated institutions, and students of not less than two years' standing, on being admitted to Cambridge, are deemed to have kept three of the terms required.

For the most recent information about the university studies, etc., the *Cambridge Calendar* for the current year should be consulted; for the history, biography, and antiquity, see Fuller's *History of Cambridge*; Dyer; Caius; Le Keux' *Memorials*; Cooper's *Annals*; Cooper's *Athenæ Cantabrigienses*; *Graduati Cantabrigienses*.

CAMBRIDGE PLATFORM, the system of church discipline agreed upon by the representatives of the New England churches at the synod held in Cambridge in 1648. In regard to doctrine they adhered substantially to the Westminster confession, though they did not impose that on the churches; but they did not accept that confession which was Presbyterian with respect to church order and polity, for regulating which they constructed the Cambridge platform, which declares that the form of church government is one and immutable, and prescribed in the word of God. According to this platform, the church in general consists of the whole company of the redeemed; but the state of the visible church militant was before the law economical, or in families; under the law, national; and since Christ, only congregational, or in local companies. In number a church ought not to be greater than may ordinarily meet together conveniently in one place, nor fewer than can conveniently carry on church work. The supreme power of the church belongs to Jesus Christ, who deposes extraordinary power to apostles, etc., and ordinary power to every particular church; officers are necessary to the well-being but not to the being of a church. Extraordinary officers, as apostles, are temporary; the ordinary, which are bishops (the same as elders or pastors) and deacons, are perpetual. A deacon's official acts are confined to temporal affairs. Any church may elect and depose its own officers, but in so doing the advice of neighboring churches should be sought. Ordination is the solemn putting a man into his office; it follows his election. In respect to Christ, the head, the church is a monarchy; in respect to the body or the brotherhood, it is like a democracy; in respect to the presbytery, or company of ministers, it is an aristocracy. Synods, though not necessary to the being, are useful to the well-being of the churches; but synods are not permanent ecclesiastical bodies. It is declared that local churches are of right distinct, equal, self-governed under Christ; yet that they should be gathered and should proceed in communion with each other; which communion they are to exercise by mutual care, by consultation, by admonition, by sharing in acts of worship, by needful transfer of members, by relief and succor. Synods have not power of church-censure and discipline, but are to declare the principles on which such acts are based, and their decisions are to be submitted to if found consonant with the word of God. The platform deals also, as its date required, with the relation of civil magistrates to affairs ecclesiastical. The platform is accepted and largely followed by the congregational churches as a useful guide, and as a strong presentation of the principles of church order given in the New Testament; but its enforcement upon any church as an authoritative rule is not attempted.

CAMBRIDGESHIRE, an inland co. of England, in lat. 52° 1' to 52° 45' n., long. 0° 31' e., and 0° 16' west. Its greatest length, from n. to s., is about 50 m., and its breadth 30 m., with an area of 820 sq. miles. Pop. '91, 188,961. About three fourths of the co. consists of arable land, meadow, and pasture, the rest being fens. The surface of C., except in the s., which is somewhat elevated and on the chalk formations, is marshy and flat, thinly wooded, and with villages and churches here and there on slight elevations, called "eys" or islands. The upper greensand, which in some places near Cambridge comes to the surface, yields in rich abundance the curious fossils miscalled coprolites (q. v.), which are of great value as an artificial manure. Their value is in some places equal to that of the land itself. The northern part of C. forms part of the Bedford level. The chief rivers are the Ouse, which crosses the middle of the county from w. to e., with its tributary the Cam; the Nene, which borders the co. on the n.; and the Lark. These are all navigable to a certain extent. C. is an agricultural county. In the higher parts, the land produces crops of beans and wheat.

CAMBRONNE, PIERRE JACQUES ÉTIENNE, 1770-1842; a French general of great renown for daring bravery, and a devoted servitor of Napoleon, whom he accompanied to Elba. He was in command of the imperial guard at Waterloo, and when entirely surrounded, and the battle utterly lost, he contemptuously refused to surrender, but fought until literally cut down. He was nearly killed, but lived to go to London, where he heard that in France he was charged with an attack upon his own country, to answer which he at once went to Paris and demanded a trial. This was granted, and he was honorably acquitted, and after the revolution of July he was restored to his rank in the army.

CAMBUSLANG, a parish and mining village in Lanarkshire, celebrated in the revivals of 1741. Pop. '91, 8300. See WHITEFIELD.

CAMBY'SES, second king of the Medes and Persians, was the son of Cyrus and Casandane, and succeeded his father in the monarchy, 529 B.C. C. is the Greek form of his name, the ancient Persian name is Kabujiya. In 525 B.C., C. invaded Egypt, defeated Psammenitus, the king of Egypt, at Pelusium, and in six months made himself master of the whole country. He meditated further conquests, but was not permitted to carry his designs into effect; the Tyrians, upon whom his maritime power depended, refused to serve him against the Carthaginians; an army which he sent to take possession of the temple of Jupiter Ammon, perished in the desert; and one which he led in person against the Ethiopians was compelled to return from want of provisions. Many stories are told of his cruelties to the Egyptians and his profanation of their religion. It is stated that he slew the calf which bore the marks of their god, Apis, that he violated their tombs, and that he put some of their leading men to death. On the authority of Herodotus, it is stated that the Egyptians thought that he had gone mad. These stories lack sufficient foundation, but it is probable that disappointment over his reverses caused him to govern with more sternness than before. A pretender to the Persian throne having appeared, C. marched against him, but died on the way, in Syria, 521 B.C.

CAMDEN, a co. in s.e. Georgia, on the ocean and the Florida border, n. of St. Mary's river, and including Cumberland island in the Atlantic; 769 sq.m.; pop. '90, 6178, includ. colored. It is level, with sandy soil, rice being the chief production. Co. seat, St. Marys.

CAMDEN, a co. in central Missouri, on the Osage river, and touched by the Atlantic and Pacific railroad, 692 sq. m.; pop. '90, 10,040, with colored. Co. seat, Lynn Creek.

CAMDEN, a co. in s.w. New Jersey, e. of Delaware river, traversed by several railroads, centring at Camden, the chief town, opposite Philadelphia; 220 sq. m.; pop. '90, 87,689. Co. seat, Camden.

CAMDEN, a co. in n.e. North Carolina, n. of Albemarle sound and e. of Pasquotank river; 250 sq. m., a portion of which is in the Dismal swamp; pop. '90, 5667, includ. colored. The Dismal swamp canal extends in this county to the Pasquotank at South Mills. Co. seat, Camden.

CAMDEN, a precinct and town, the latter the co. seat of Wilcox co., Ala., 33 m. s.w. of Selma; pop. in 1890, precinct, 2624, includ. colored; town, 545. The town is on an eminence 4 m. from the Alabama river, and is the centre of an important trade.

CAMDEN, a city and co. seat of Ouachita co., Ark., 82 m. s.w. of Little Rock, at the head of navigation on the Ouachita river, in a good situation for trade; pop. in 1890, 2571, includ. colored. The place was formerly a rendezvous for hunters.

CAMDEN, a town in Knox co., Me., 40 m. s.e. of Augusta and 8 m. n.e. of Rockland; on the w. shore of Penobscot bay. It contains churches, a bank, newspaper office, shipyards, and manufactories of ship's furniture, cars, car wheels, and woolen goods. It is connected with Boston by the Boston and Bangor S.S. line. The chief export is lime. Pop. '90, 4621.

CAMDEN, a city, port of entry, and co. seat of Camden co., N. J., on the Delaware river, opposite Philadelphia, with which it is connected by several lines of ferries. The Camden and Amboy railroad, incorporated in 1833, gave Camden its early importance as a railroad terminus. The city, which was chartered in 1828, lies on level ground, with streets crossing at right angles. It contains a city hall and county buildings, numerous churches, a hospital, three national banks, several benevolent institutions, excellent schools, and daily, weekly, and monthly periodicals. The water-supply is pumped from the Delaware river at Pavonia, one mile above the city. Camden is noted for its varied manufactures and for the immense market gardens on the outskirts. The principal industries are iron foundries, ship-building yards, lumber mills, and manufactories of chemicals, steel pens, and machinery. In 1890 the capital invested in manufactures was \$15,244,506, employing 10,362 persons, and produced goods valued at \$21,145,637. Camden is an important shipping point and railroad centre, being the terminus of the South Jersey Railroad, the West Jersey Railroad, and its branches, the Atlantic City Railroad, the Camden and Atlantic Railroad, and the Amboy Division of the Pennsylvania Railroad. Population in 1890, 58,813.

CAMDEN, a town and co. seat of Kershaw co., S. C., 33 m. n.e. of Columbia, on the Charleston, Cincinnati and Chicago and the South Carolina and Georgia railroads; pop. '90, 3533. Two battles were fought in the vicinity in the war of the revolution; the first

on Aug. 16, 1780, when the English commander Cornwallis defeated Gates and the revolutionary forces, mortally wounding Baron De Kalb; and a less important engagement a year later, when Greene and the Americans were repulsed by the English under Rawdon. In 1825 a monument was erected at Camden to the memory of De Kalb. During the war of 1861-5, the town was captured by the Union army, and nearly all the business part burned.

CAMDEN, CHARLES PRATT, earl of, a younger son of sir John Pratt, chief Justice of the court of king's bench in the reign of George I., was b. in 1714. Educated at Eton and Cambridge, he studied for the law, and was called to the bar in 1738. Not until 1752, however, when he defended a bookseller successfully against a government prosecution for libel on the house of commons, did C.'s prospects appear very promising; from this time his success was certain. In 1757, he was appointed attorney-general, and four years afterwards accepted a seat on the bench in the court of common pleas. Judge in the trial of Wilkes, he declared his opinion emphatically that the action of government in this case, by general warrants, was altogether illegal—an opinion which, chiming in with public sentiment at the time, made him the most popular of judges. In 1765, he was created baron C. of Camden place, Kent, by the Rockingham administration; to whose American policy, and to their treatment of Wilkes, notwithstanding, he offered constant opposition. The following year, when he was made lord chancellor, he did not abandon his principles; and four years after—the duke of Grafton being then prime minister—he supported an amendment made by Chatham on the government address, and resigned his place. His judicial career ended here; henceforth he was entirely a political character, and for more than 20 years took an active part against the ill-advised American policy pursued by lord North, and in discussions on the law of libel, in which he maintained the popular view. As a judge he is held in high estimation, though his manner was somewhat undignified. He was president of the council under Rockingham in 1782, and also under Pitt in 1783-94. He d. in 1794.

CAMDEN, WILLIAM, one of the most distinguished scholars and historians, and the most laborious and painstaking antiquary of the 16th c., was b. in London, where his father was a paper-stainer, in May, 1551. His education, commenced at Christ's hospital, was completed at St. Paul's school, and at Oxford. In 1575 he was appointed second-master of Westminster school; and it was while discharging the duties of this office that he undertook the work which has made his name famous, his *Britannia*, giving an account of the British Isles from the earliest ages, which, written in elegant Latin, was first published in 1586. It at once brought him into communication with the learned men of his time. Before 1607 the work had passed through six editions, being greatly enlarged and improved by the indefatigable industry of the author. The book, at first but a comparatively small single volume, has received much additional matter from other writers. The best known edition of C.'s *Britannia*, is that of Edmund Gibson, in English, 2 vols. fol. Of this great work of C., Bishop Nicolson said it was "the common sun whereto our modern writers have all lighted their little torches." In 1593, C. was appointed head-master of Westminster school; and four years later, he was made clarencieux king-at-arms, an appointment which gave him more time for the pursuit of his favorite studies. His other most important works are—*Annals of the Reign of Elizabeth*; *A Collection of Ancient English Historians*; *An Account of the Monuments and Inscriptions in Westminster Abbey*; and a *Narrative of the Gunpowder Plot*. He died in 1623, at the age of 72, and was buried in Westminster Abbey. Before his death he endowed a professorship of history at Oxford.

CAMDEN SOCIETY, founded in 1838 in honor of William Camden (q.v.) to publish early historical and literary remains. Up to 1893, 160 volumes had been issued.

CAMEL, *Camelus*, a genus of quadrupeds of the order *ruminantia*, of which only two species exist, both of great use to mankind. This genus is the type of the family *camelidae*, to which there belongs only one other genus, *auchenia* (q.v.), including the llama, alpaca, etc. The whole number of species of *camelidae* is, therefore, very small, and they seem to belong originally to limited regions, both in the old world and in the new. To the peculiarities of these regions, they exhibit a wonderful completeness of adaptation. The family is regarded as forming a sort of link between the orders *ruminantia* and *pachydermata*. The dentition differs from that of all other ruminating animals, particularly in the presence of incisors or cutting teeth in the upper jaw; camels having also canine teeth in both jaws, and the llama and its congeners in the lower jaw of both sexes; and differences equally important appear in the feet, which have not the cloven hoof common to all the rest of the order—two short toes with separate hoofs adapted to one another—but two elongated toes, each tipped with a small nail-like hoof, the feet resting not upon the hoofs, but upon elastic pads or cushions under the toes.—In the camels, the toes are united by a common sole, thus resting upon one extended pad, instead of having each a separate one, as in the genus *auchenia*; the broader expanse of the foot enabling the animals of the one genus more easily to traverse the loose sand of the desert, whilst the separation of the toes in the other is suited to the uneven surface of rocky heights. The camels are also distinguished by the females having four teats, whilst those of the other genus have only two; and by a hump or humps upon the back, of which the llama and its congeners exhibit no trace. The long neck, small head,

prominent eyes, and tumid and cleft upper lip, with considerable prehensile power, are common to both genera; but with much similarity of form, as well as of particular characters, the *camelidæ* of the Andes exhibit a gracefulness of outline which strongly contrasts with the gaunt angularity of those of the eastern deserts. Camels are indeed animals of uncouth appearance. Of the two species, that known as the Arabian C. (*C. dromedarius*) has only one hump on the back, whilst the bactrian C. (*C. Bactrianus*) has two. Some confusion has arisen from the occasional employment of the name dromedary as a designation of the former species, it being, however, more properly limited to a particular variety of that species, more slender and graceful than the ordinary variety, and of much greater fleetness. Buffon's notion, that the hump is a badge of servitude, and the consequence of harsh treatment throughout many generations, is singularly at variance with what we know of its uses. The hump on the C.'s back is a wonderful provision of nature, to adapt the animal to the endurance of long abstinence from food, or subsistence on very scanty supplies, to which it is often subjected in the desert, and without a capacity for which it would be comparatively of little value to man; and the wide deserts across which he journeys and transports his merchandise by its aid, would be altogether unpassable. The hump is, in fact, a store of fat, from which the animal draws as the wants of its system require; and the Arab is very careful to see that the hump is in good condition. Beyond its limit, the C. gets ill and dies; and when much exhausted, three or four months of repose and abundant food are necessary to restore it. The backbone of the C. is as straight as that of other quadrupeds.—Another very interesting adaptation to the desert is to be noticed in the thick sole which protects the feet of the C. from the burning sand, and in callosities of similar use on the chest and on the joints of the legs, upon which the C. rests when it lies down to repose, or kneels, as it does for various purposes, and is taught to do that it may be loaded, or that its rider may mount upon its back.—The wedge-shaped cutting-teeth of the lower jaw are also particularly fitted for browsing on shrubby plants, such as the desert produces—the camel's thorn, tamarisk, etc., which form a large part of the food of the C.; the eyes are furnished with long eyelashes, to protect them from the glare and from the drifting sand; whilst the exclusion of the sand from the nostrils is also provided for by a power of closing their oblique openings at will. But most interesting of all is the provision made for the C.'s endurance of long drought, by the lining of the inside of the second stomach, or honeycomb-bag, and of a portion of the first stomach or paunch, with great masses of cells, in which water is stored up and long retained. This store of water is well known to the Arabs, who, when sore pressed by thirst, sometimes avail themselves of it by killing some of the camels of the caravan.—The first stomach of the *camelidæ* is divided into two compartments by a muscular band—one of the points of difference between them and the other ruminants. Muscular bands, proceeding from this principal one, and intersected by other muscular bands, nearly at right angles, form the cells for containing water. It may be added here, that the senses both of sight and smell are extremely acute in the C., and that it is capable of discerning water at a great distance.

The Arabian C. carries twice the load of a mule. The Bactrian C. is sometimes loaded with 1000 or even 1500 lbs. weight, although not generally with so much. In the Soudan campaign (1884) a camel corps, consisting of soldiers mounted on camels, formed a part of the expedition. The use of the C. for the conveyance both of travelers and merchandise has won it the name of the *ship of the desert*. A caravan sometimes contains 1000, sometimes even 4000 or 5000 camels. The supply of food carried with the caravan for the use of the camels is very scanty: a few beans, dates, carob-pods, or the like, are all that they receive after a long day's march, when there is no herbage on which they may browse. The pace of the loaded C. is steady and uniform, but slow; it proceeds, however, from day to day, accomplishing journeys of hundreds of miles at a rate of about 2½ m. per hour. Some of the slight dromedaries, however, can carry a rider more than 100 m. in a day. The motion of the C. is peculiar, jolting the rider in a manner extremely disagreeable to those who are unaccustomed to it; both the feet on the same side being successively raised, so that one side is thrown forward, and then the other.

The C. produces only one young one at a time, or rarely two. It lives 30 or 40 years.

The patience of the C. has been celebrated by some authors; and the cries by which it expresses its sense of injury when a heavy load is placed upon its back have been pathetically described. With all its general submissiveness, however, the C. is resentful of injury, and during the rutting season it becomes particularly vicious.

The flesh and the milk of the C. are much valued by the Arabs as articles of food. The dung is used for fuel, and it was from the soot of this dung that the sal-ammoniac, formerly imported from Egypt, was obtained by sublimation, whilst the sources from which that substance is now procured were unknown. The hair is used for the manufacture of cloth, some kinds of which are coarse, and others comparatively soft and fine. C.'s hair is also imported into Europe for the manufacture of the pencils or small brushes used by painters. The C. can now scarcely be said to exist anywhere in a wild state. It has lately been introduced into Australia.

A fossil species of C. (*C. Sivalensis*), larger than either of the existing species, has been discovered in the tertiary deposits of the Sewalik hills, in Hindustan.

CAMEL, a machine for floating ships over shoals and bars. A long, water-tight box, or caisson, nearly filled with water, is sunk on either side and attached to the ship, and then the water in the caissons is pumped out, adding additional buoyancy as they become empty. The C. is sometimes employed in raising sunken ships, and the principle is applied to dry docks in some instances.

CAMELFORD, a t. in the n.w. of Cornwall, near the source of the Camel (crooked brook), 14 m. w. of Launceston. It lies in a high and hilly tract near the moors. It has a small population. C. is said to have been the scene of a battle, in 542, between king Arthur and Mordred, his nephew, when both were slain. The West Saxons, under Egbert, had a battle with the Britons here in 823. The ruins of king Arthur's castle, Tintagel, stand on the high rocky coast, 4 m. n.w. of Camelford. Two m. n. of C. are the celebrated slate-quarries of Delabole, employing a large number of men. Macpherson, the author or translator of Ossian, was member of parliament for C. in 1791, but the reform act of 1832 disfranchised the borough.

CAMELLIA, a genus of plants of the natural order *ternstræmiaceæ* (q.v.), natives of China, Japan, and the n. of India—some of which are now among the most common and admired green-house shrubs in Britain and other countries too cold for their cultivation in the open air, receiving the same sort of attention which is bestowed on other florists' flowers, and with the same result, of an endless multiplication of beautiful hybrids and varieties. The best known and most esteemed is *C. Japonica*. Its leaves are ovate-elliptical, almost acuminate and serrate, shining; the flowers without stalks, mostly solitary, large, and rose-like. It is a native of Japan; and there and in China it has been carefully cultivated from time immemorial. In its wild state, it has red flowers; and the red single C. is much used by gardeners as a stock on which to graft the fine varieties, the flowers of which are generally double, and in many cases most completely so. Many of them are of Chinese or Japanese origin; many have been raised by cultivators in Britain, continental Europe, and America. Their colors are very various; and the varieties also differ much in the form and position of the petals. It adds to the value of the C. that its flowering time is in autumn, winter, and spring. By those who can afford the expense, entire houses are often devoted to the culture of camellias. Some cultivators are careful to protect them from direct sunshine, others recommend an opposite treatment in this particular; it is agreed by all that free access of air is of great importance, and that water must be given very liberally, yet with such caution that the soil may never remain soaked after the immediate wants of the plant are supplied. The cultivation of camellias in the windows of houses is often attended with disappointment, from the buds dropping off when almost ready to expand, which is generally owing either to a neglect or an excess of watering; an apparently slight mistake, either of the one kind or of the other, being very speedily productive of this evil. Too much heat at this time is also apt to cause the flower-buds to fall off. The C. flowers well, when the temperature is kept not very much above the freezing-point, but frost it cannot bear. In the s. of England, some of the varieties are occasionally trained to walls in the open air, receiving a little protection in winter. The proper soil for camellias is a loose black mold; a little sand and a little peat are often advantageously mixed with loam to form it. Camellias are often propagated by cuttings, often by layers; but the finest varieties very generally by grafting or by inarching. The single C. is also propagated by seed, and in this way the best stocks for grafting are procured.—Of the other species of C., the most hardy, and one of the most beautiful, is *C. reticulata*. The true tea plant is practically a camellia. See TEA.

CAMELLIA/CÆÆ, an order of exogenous trees and shrubs in s. and e. Asia and South America; North America has four species. The tea plant and the camellia are specimens.

CAMELOPARDE/LIS. See GIRAFFE.

CAMELOPARDE/LIS, a constellation defined by Helvelius, between the pole-star, Auriga, Cassiopeia, and the head of Ursa Major, consisted of stars of the 4th and lower magnitudes, forming, in imagination, the shape of a giraffe.

CAMELOT, a steep hill in the parish of Queen's Camel, Somersetshire, England, five miles from Ilchester. The town possesses some remains of considerable antiquity and is identified by tradition with Camelot, one of the capitals of the legendary King Arthur (q.v.). Others state that Camelot was the name given in the mediæval romances to the city which grew up out of the permanent quarters of the second Augusta legion at Caerleon-upon-Usk. Camelot is frequently mentioned by Tennyson. See, for example *The Lady of Shalott*, *Morte d'Arthur*, and *Guinevere*.

CAMEL'S HAIR is woven by Persians and Arabs into material for tents and clothing. In early ages rough garments of this stuff were worn by monks and priests by way of penance. A fine article of camel's hair is used for pencils by artists.

CAMEL'S HUMP, or CAMEL'S BACK MOUNTAIN, one of the peaks of the Green Mountains, 4088 ft. high; 17 m. w. of Montpelier, Vt.

CAMEL'S THORN, *Alhagi*, a genus of plants of the natural order *leguminosæ* (q.v.), sub-order *papilionaceæ*, containing a number of herbaceous or half-shrubby species, natives chiefly of the deserts of the east, having simple leaves, minute stipules, racemes of red flowers, and jointed pods with one seed in each joint. • These plants are of great

importance on account of the food which they afford for camels, where other vegetation is far from being abundant; and camels are particularly fond of them. *A. camelorum*, a herbaceous species, yields a kind of manna (q.v.), which appears in the form of drops, as of honey, on the leaves, and gradually hardens. A similar exudation is yielded by *A. nipalensis*, another herbaceous species; but it is not certain that the manna of Persia and Bokhara is produced, as has been alleged, by *A. maurorum*, a shrubby species 2 or 3 ft. in height, which certainly does not yield it in India or Egypt; the supposition that this exudation results from some peculiarity in the climate of Persia and Bokhara, being perhaps less probable than that of a mistake concerning species not very dissimilar.

CAME'NE, nymphs in Roman mythology, with prophetic powers, named Egeria, Carmenta, Antevorta, and Postvorta. The poets sometimes give the name to the nine muses.

CA'MENZ, or **KAMENZ**, a t. in Saxony, 22 m. n.e. of Dresden; pop. '90, 7700. In 1742, the town was nearly destroyed by fire. Lessing was born here, and in 1826 a public hospital was dedicated to his memory.

CAMEO (Ital. *camei*). Gems cut in relief are called cameos, in opposition to those that are hollowed out so as to yield a raised impression, which are called *intaglios*. The term C., however, is applied more especially to those diminutive pieces of sculpture which are prepared from precious stones having two strata or layers of different colors, the undermost of which is left to form the background, the object to be represented being cut in the upper one. The stone generally used for this purpose by the ancients was the variegated onyx.

The art of cameo-cutting is of great antiquity. It is believed to have been of Asiatic origin, and to have been practiced by the Babylonians, from whom the Phenicians carried it into Egypt. From the Egyptians, it was transmitted to the Greeks, who brought it to great perfection; and latterly it was practiced very extensively, and more successfully than perhaps any other art, in Rome. To what extent the gems, commonly called Etruscan, are in reality early Greek, is a subject of dispute amongst the learned. It was not till a comparatively late period—the age following Praxiteles—that cameo-cutting became popular in Greece; and it was in the courts of the successors of Alexander that it was chiefly patronized. At this period, cameos were very extensively used, not only as personal ornaments, but in cups, vases, candelabra, and other objects of domestic luxury. Pateræ and other vessels were frequently worked out of a single stone, upon which were exhibited a whole series of figures of the most exquisite workmanship. Many of the antique cameos which have been preserved are wonderfully beautiful both in design and execution. The finest specimen in existence is said to be the Gonzaga C., formerly at Malmaison, now at St. Petersburg. It represents the head of a prince and his wife, probably Ptolemy I. and Eurydice. Winckelmann mentions a C. representing Perseus and Andromeda, in such high relief, that almost the whole contour of the figures, which are of the most delicate white, is detached from the ground. It belonged to the painter Mengs, and at his death was purchased by the empress Catharine of Russia. The only other gem which Winckelmann is disposed to rank with that just mentioned, is “the Judgment of Paris” in the cabinet of the prince Piombino at Rome. Of cameos of the Roman time, many fine specimens are to be found in the continental museums. The most celebrated C. in England is the “Cupid and Psyche,” in the Marlborough collection, by Tryphon, who is supposed to have lived in Macedon under the immediate successors of Alexander. The stones on which many of these cameos are cut are of surprising, and, in modern times, unequalled size and perfection. They are supposed to have been procured by the ancients through their oriental and African commerce. Cameos do not seem to have been made in mediæval times; but the art revived in Italy, under the auspices of the Medici; and the production of cameos, both in *pietra dura* and in shell, has there become a branch of art-manufacture of considerable importance. Impressions from antique cameos in glass, sulphur, porcelain, and other materials, are produced in many places; and for artistic purposes, possess all the value of the originals.

Glass Cameos.—The manufacture of cameos from artificial substances was not unknown to the ancients. One of the most beautiful specimens of an imitation of C. in glass is the famous Barberini or Portland vase, now in the British Museum. The ground is blue, the figures, which are in low relief, being of a delicate, half-transparent white. See **PORTLAND VASE**. Many fragments of the same kind of manufacture exist in other cabinets, but that which we are fortunate enough to possess is believed to be the only perfect example.
